THE

INTERNATIONAL CYCLOPÆDIA.

MOLTKE, Hellmuth Carl Bernhard, Count von, was born, October 26, 1800, at Parchim, in the Grand Duchy of Mecklenburg-Schwerin. Having entered the Danish Service as a cadet at an early age, he sought and obtained a discharge as soon as he was of age, and at once entered the Prussian army (1822), being assigned to duty on the staff in which he remained until 1835, when the Sultan Mahmud asked the temporary assistance of Prussian officers in the reorganization of the Turkish Army, and Moltke was one of those who were appointed to this service. By the Sultan's request he was allowed to remain in Turkey till 1839, when, on Mahmud's death, he returned to the Prussian staff. In this interval he had advised and directed the improvement of the Turkish fortresses in Bulgaria, and the intelligence with which this had been done was very significantly acknowledged by the Russians during the Crimean War in 1854. On his return home he published in 1841 a memoir on the condition of Turkey, which is still an authority. For some time after this, his life presents no striking incidents, since the long peace which followed the downfall of the first Napoleon continued unbroken, and though all the great Powers kept up their immense standing armies, there was little for the ambitious staff officer to do but to perfect the administration of the peace establishment and train himself in the theory of his art. At forty-two, Moltke was only major in the staff, though noted as an officer who was reported to have mastered and well digested everything that had been written on the art of war, ancient or modern. He had practical familiarity and easy use of seven languages, and was a clear-headed and indefatigable student who had the genius of system, and the rare faculty of enforcing his own ideas of order and accuracy without losing the character of amiability and comradeship. His talents were recognized, and for the thirteen years preceding 1859 he was for the most part the military adjutant of one of the royal princes, or chief of staff of a corps. At the last-named date he was made Chief of Staff of the Army with the rank of Lieutenant-General, and then, as he was entering his sixtieth year, an age at which the majority of men have finished the important portion of their life's work, his great career may be said to have begun.

The thorough reorganization and perfection of the Prussian army as a great military engine was the task on which Moltke brought to bear all the powers of his wonderfully comprehensive intellect. Since 1850, when the so-called "Olmütz incident" showed the weakness of the Prussian military preparation, this work was pressed steadily forward. A succession of energetic and able war-ministers, among whom the last and greatest was von Roon, succeeded in bringing the organization to a high pitch of accuracy and harmony, and Moltke's pre-eminence consists in his being the man to direct and handle the great army in actual war, with a systematic skill in strategy and a strength of grasp in the multitudinous details, which should be worthy of the splendid organization itself. King William doubtless spoke from his own complete knowledge of the fact, when in the banquet after the surrender at Sedan, he toasted Gen. von Roon as the minister who had whetted the sword of Germany, and Gen. von Moltke as the arm that had wielded it.

Moltke's method of wielding it, however, was only possible by reason of his having prepared the way for it by a long course of education and discipline of the officers who were to carry out any plan of campaign. He was himself a lucid and attractive lecturer, and succeeded in inspiring the staff schools with an enthusiastic interest in their work. He systematized the knowledge efficient officers should possess, put them in the way of getting at it in every department, and taught them how to make it practically available. A constant interchange of line and staff duties kept the staff at ease in the actual discipline, drill, and handling of troops, and in the administration of the business of each corps and division. Special talents were marked and recognized wherever they appeared.

He made a study of the cause and cure of the common discrepancy between the nominal and actual numbers in an army. The detailing of men from the ranks for

administrative duties was practically abolished. Teamsters were enlisted for that duty, and formed a corps by themselves, including a certain number of train guards. Stretcher-bearers and ambulance men were organized in the same way. So were hospital attendants and the like. The battalion must mean so many effective men under arms whenever a campaign should open.

Nothing was left to chance; little to the invention or the inspiration of the moment. It was intended that the arms of the Prussian soldier should be, if possible, better than those of his enemy—at least they should be as good. It was intended that his drill, equipment, physical condition, and mental and moral forces should all be superior. It was intended that a superior number of these equally brave, equally strong, equally armed men should meet the enemy at the critical points. The means of locomotion by railway or on foot, the scientific use of these means, the capacity of trains, the endurance of men's bodies, were all calculated as the physicist calculates forces and resistances in the laboratory, and were perfected with a scientific care which should make the practical campaign in the field as certain to realize the plan as the skillful professor's experiment in public realizes the theory elaborated in his study. In all this Moltke was the professor of the art of war; the army, the staff, the telegraph, and all the tremendous military engines of modern warfare were the apparatus by which he exhibited to the world the startling demonstration of the scientific distinction of a dynasty and a great military power. He did not appear with dazzling decorations at the head of the army in the field; a plain, thoughtful man in his cabinet, out of sight of the troops and out of hearing of the guns (for the most part), manipulated the wires which carried orders as they might have carried an explosive spark to a mine or a torpedo.

The first test of von Moltke's qualities as a soldier in the field, and of the efficiency of the great military machine that he directed and controlled, was given in the petty war between Denmark and the Austro-Prussian alliance in the conquest by the latter in 1864 of the Schleswig-Holstein provinces of Denmark. This was but a small matter, however, as the Danes were overwhelmingly outmatched from the outset. The first grand display of the Prussian commander's genius was in the so-called Seven Weeks' War between Prussia in alliance with Italy, on the one hand, and Austria and the South-German States on the other, terminating in the great battle of Königgrätz or Sadowa, in which von Moltke defeated the Austrian general, Benedek so completely as to put an end to the war. For this splendid feat of arms, he was decorated with the Order of the Black Eagle, and received from the Prussian parliament a grant of 500,000 marks.

The Franco-German war of 1870–71 (q.v.) was the occasion of the crowning triumph of his career. The war had been expected, and every detail had been carefully studied out by the great general. The story is told that after the French emperor had telegraphed his declaration of war, Moltke was awakened by an aide, and informed of the news. "Open the third drawer on the left, and you will find the plan for the campaign," returned Moltke, and turning over, fell asleep again. And so he did not enter France until the victories at Wörth and on the heights of Spicheren had been won; till the armies of Steinmetz and Prince Frederick Charles were under the walls of Metz, and the army of the Crown Prince was turning the line of the Moselle by the south. Yet in a strategic point of view, the campaign was already decided; the French were put upon a passive defensive, and the blows followed each other with such relentless continuity and force that no opportunity was given for new combinations or for reorganization. The French Emperor had thought that he was ready and could seize the initiative as the first Napoleon had done. Gen. Leboeuf, his chief of staff, had assured him that all was prepared, "to the last gaiter-button," but a single month taught him a sad lesson as to the true meaning of military preparation.

The entire war, from Wörth to Sedan, and from Sedan to the capitulation of Paris was, as is well known, a succession of brilliant victories for the German arms. Moltke's combinations were carried out with a certainty and a precision that seemed almost miraculous. For these services he was rewarded in September, 1871, by promotion to the rank of Marshal; a second grant of money, and the title of Count was conferred upon him in 1872. The Czar of Russia also decorated him with the Order of St. George; and the German Emperor gave him the Grand Cross of the Order of the Iron Cross.

Von Moltke retired from active service in August, 1888, being succeeded by Count von Waldersee; but the Emperor made him President of the National Defense Commission. It was a singular tribute to his powers, that when almost ninety years old, the whole world as well as his own countrymen looked to him to conduct a new campaign, if war should occur, without a thought as to his age or a doubt that his action would be as vigorous as if he were but forty.

In October, 1890, his ninetieth birthday was celebrated by an immense torchlight procession in Berlin in which more than 10,000 persons took part, and by general rejoicings throughout the empire. Soon after, Count von Moltke retired to his estates, where some months later he died, on the 24th of April, 1891.

Count von Moltke was physically slight, of an unassuming appearance, with smooth face and a slight stoop. His demeanor was one of a natural reserve, and his taciturnity was proverbial, so that the Germans, in addition to the more affectionate title of "Vater Moltke" gave him the name of "der grosse Schweiger," while the French called him "le Danois muet." It was said of him epigramatically that "he knew how to be silent in seven languages." Count von Moltke was married to an English lady, Miss Mary

Burt, with whom he lived most happily, and whose death in 1862 was to him an affliction for which he never ceased to sorrow.

His writings are as follows: *The Campaign of the Russians against the Turks* (1835); *Letters on the Situation of European Turkey* (1841, French trans., 1872); *The Italian Campaign of 1859* (1863); *The German Army* (1871); *Letters written to Mme. von Moltke in 1856* (1870); *The Franco-German War* (1872); *Instruction on the Service of the General Staff* (1873). In June, 1891, after the general's death, Prof. von Treitschke, the historian, made public an interesting paper by von Moltke on the campaign of Königgrätz, that is full of invaluable information to the student of that masterpiece of generalship. See Max Brewer's *Bismarck, Moltke, und Goethe* (1889), the desultory *Memoirs and Memoranda* collected and published in 1891, and biographies by Müller-Bohn (1893), Jähns (1894) and Buchner (1894).

MOLUCCAS, or Spice Islands, an archipelago in the Dutch East Indies, including in its broadest sense the region between 5° n. and 9° s. lat., and 124° e. and 136° e. long. They lie e. of the island of Celebes, stretching from thence to New Guinea or Papua, and from the Philippines toward the northern coast of Australia, and they include all the territories formerly ruled over by the sultans of Ternate and Tidore. Both geographically and administratively they are divided into two groups, the northern group, comprised within the residency of Ternate, and the southern group in the residency of Amboyna. Their total area is 43,864 sq. miles, and the population at the close of 1894 was estimated at 402,053. In geological structure they resemble the island of Celebes. Many of the smaller islands are of volcanic formation throughout, and on Ternate, as well as in Makian, Banda, and Tidore, there are active volcanoes. The highest altitude in the archipelago is reached by the mountain Gunong Tomahu, in the island of Buru, with a height of over 9,800 ft. The climate is hot, but as a rule not unhealthful.

The Moluccas are not so well watered or rich in vegetation as the more westerly islands in the Dutch East Indies, but the production of spices, from which they derive their name, is very abundant. The betel-nut, nutmeg trees, and various other spice-producing plants are here indigenous. Coffee, cacao, tobacco, indigo, and rice are cultivated with success, and the sage tree yields the staple fruit for native consumption. In regard to the fauna, the islands resemble the other parts of the Australasian region. Besides species of marsupials, there are wild hogs, civet cats, apes and an indigenous species of goats. These animals, as well as many varieties of birds, resemble the species found in the countries to the east. Birds of bright plumage abound in the forests. Among the insects, the butterflies are remarkable for their size and the brilliancy of their colors. As to minerals, porcelain and clay abound, especially in the Uliasser islands and Amboyna; petroleum, tin, and coal are found on the south coast of Ceram; gold and coal, and to some extent iron, limestone, and alum are found in Batjan.

The industry is chiefly confined to the raising of spices and food products. While the clove-tree and the nutmeg occur in all the islands, clove-culture is carried on especially in Amboyna and the Uliassers, and the cultivation of the nutmeg in the Banda islands. Until 1824 the Dutch prohibited the planting of these trees in other parts, and caused those of native growth to be rooted out, in order to prevent smuggling and to retain the supply of these spices for the European market.

The natives of some of the islands are Alfoers; of others Malays on the coast, and Alfoers in the interior. The Alfoers are the original inhabitants of the islands and are to be found in greatest numbers in the interior of the larger islands, especially in Halmahera, Buru and Ceram. The Malays are immigrants and their racial character has been greatly modified by amalgamation with Chinese, Arabs, and Europeans.

Trade is for the most part confined to Ternate, the Banda islands and Amboyna. It includes spices, sago, wax, coffee, cacao, tobacco, tortoise-shell, and trepang. Macassar, on the west shore of the island of Celebes, exports to the United States considerable quantities of cassia, cloves, gum copal, coffee, nutmegs, and mace. The imports of the islands include cattle, horses, rice, salt, pottery, and textiles.

The residency of Ternate includes the northern part of the Moluccas together with parts of Celebes and the Sulu islands. The population of the residency proper was estimated in 1893 at 107,147. To it belong also the dependent kingdoms of Ternate, Tidore (including the western part of New Guinea), and Batjan. The island of Ternate is one of the largest in the groups, and consists of a volcanic mountain nearly 5,400 feet high, with plains at its base. The town of Ternate is on the e. side and is the seat of the Dutch resident. It contains also the sultan's palace and a fort. It has a harbor, and its population numbers about 6,000. Tidore is also a large island of volcanic formation. It is under the government of a sultan who is subsidized by, and subject to, the Netherlands, exercising his authority under the control of the resident. His palace is in the city of Tidore on the east coast. Batjan, or Batshan, is another dependent kingdom, subject to the residency of Ternate. It lies to the s.w. of Halmahera and is mountainous, well wooded, and well watered. Some of its mountain peaks rise to a height of 4,000 feet. Valuable timber trees abound in its forests. Its flora is said to be the richest in the Moluccas and it is remarkable for the numerous species of birds and insects. Few mammals are found in the island, but there is a species of baboon. Copper, gold, and coal are found to some extent. The island is the home of the clove-tree. The natives, or Alfoers, are the most numerous element in the population, which numbers between 12,000 and 13,000. They are for the most part of Mohammedan faith, but there are some

native Christians, living chiefly at Labuha and Fort Barneveld. There are besides some Europeans, Chinese, and Arabs. The native sultan has his residence at Amasang. The Obi group also belongs to the residency of Ternate. It comprises Great Obi, and a group of ten smaller islands. They are all well wooded and abound in nutmeg trees, but the climate is unhealthful, and the islands are chiefly peopled by fishermen, and are the resort of pirates.

The residency of Amboyna comprises the Southern Moluccas, the Banda group, Ceram, Buru, the Arru, the Key, the Tenimber and other islands, with a total population of 103,200, in 1890, of whom only a small portion were Europeans. The resident has his seat at Amboyna, the capital, and there are 19 Dutch stations in the residency, including a military post on the island of Ceram. The island of Amboyna (q. v.) is the largest in the residency. It is mountainous, well watered and fertile. The cultivation of the clove-tree is the most important industry. The Banda group lies between 3° 50′ and 4° 40′ s. lat., and is divided by the meridian 130°. It includes, besides the two chief islands, Great Banda and Neira, the smaller islands of Ay, Rhun, Rozingain, Pisang and others. The principal island of the group is Neira, lying s.e. from Amboyna and separated by narrow straits from the volcanic island of Gunong-Api on the w., and Great Banda on the e. Its chief town is Neira on the s. side of the island. The Banda islands have a rich soil and derive considerable wealth from the cultivation of the nutmeg trees. Pineapples, the vine, bananas, cocoanuts and other fruit trees thrive and are abundant. There are wild cows, hogs, and deer, and in the surrounding waters an abundance of sea-carp and mackerel, which last are dried, and form, with sago, the food of the natives.

In 1512 the Portuguese discovered the Moluccas, and in 1521 Antonio de Brito appeared to take possession of them in the name of the king of Portugal; but after a long period of violence, intrigue, and perfidy, the Portuguese were driven out by the Dutch and natives at the beginning of the 17th century. The change was of no advantage to the natives, for the Dutch, having obtained the exclusive right of buying all the cloves at a nominal value, a series of wars ensued, which resulted in the subjugation of the Spice islands. The Dutch confined the cultivation of the clove-tree to Amboyna and the neighboring islands, and the cultivation of the nutmeg-tree to the Banda group, and allowed these trees in the other islands of the group to perish. New sultans of Ternate and Tidore have been appointed, with less power than their predecessors; and the wars with the Alfoers of Ceram, in 1859 and 1860, have brought them more fully under Dutch rule. The cultivation of the clove-tree was made free in 1863. See J. J. de Hollander, *Handleiding bij de Beoefening der Land-en Volkenkunde von Ned. Oost. Indië* (Breda, 1877 and 1882); Bastian, *Indonesien* (1884); Bokemeyer, *The Moluccas, etc.* (1888), and Martin, *Travels in the Moluccas, etc.* (1894).

MOLY, a fabulous plant, said to be a panacea for all diseases, given by Hermes to Odysseus as a protection against the magical charms of Circe. It was supposed to be a variety of garlic. There is a kind of garlic still called "sorcerer's garlic," probably a reminiscence of the Circe legend.

MOLYBDE'NUM (sym. Mo; equiv. 48—new system, 96; sp. grav. 8.62) is a rare metal, which, in a state of purity, is of a silvery white color, has a strongly metallic luster, is brittle, and very difficult of fusion. It never occurs native, and its principal ore is the bisulphide, which much resembles graphite. It is also occasionally found oxidized, in molybdate of lead. The metal may be obtained by roasting the bisulphide in a free current of air, when the sulphur goes off oxidized as sulphurous acid, and the molybdenum is also oxidized into molybdic acid (MoO_3), and remains in the vessel. By the action of charcoal, the reduced metal is then obtained from the acid.

Molybdenum forms four compounds with oxygen—the protoxide, MoO, the binoxide, MoO_2, the sesquioxide, Mo_2O_3, and the trioxide, also called molybdic acid, MoO_3. The trioxide alone has any practical value. It is a white, crystalline powder, which is almost insoluble in water, fuses at a red heat, and unites with bases to form well-marked salts, the molybdates, which are either colorless or yellow. A solution of molybdate of ammonia is one of the most delicate tests for phosphoric acid.

Molybdenum forms various compounds with sulphur, chlorine, etc., none of which are of any practical importance, except the native bisulphide.

MOLYNEUX, William, ll.d., 1656–98; b. Ireland; educated at Trinity college, Dublin, and afterwards a member of the middle temple, London. He had been instructed in mathematics by his father, Samuel Molyneux, who had written a work on gunnery, and he soon turned his attention from law to mathematics and optics. He was one of the founders and the first secretary of the Dublin Philosophical Society. Two years later he was made a member of the London Royal Society, and was sent by the English government to examine the fortifications in the Netherlands. In 1688 he was forced to leave Ireland on account of the political troubles there, but he came back after the battle of the Boyne. In 1692 he represented the Dublin university in the Irish parliament. His main work, the first in English upon the subject, is a treatise on optics, called *Dioptrica*. This book was revised by Halley, who included in the appendix his theorem for finding the foci of optic glasses. He also published a *Translation of the Six Metaphysical Dissertations of Descartes,* and numerous papers in the proceedings of the Royal Society. One of his

non-scientific works contains some interesting reminiscences of the war in Ireland—his *Journal of the Three Months' Campaign of his Majesty in Ireland* (1690).

MOMBASSA, or MOMBAZ, a seaport t. of east Africa, seat of administration of British east Africa, on a small coralline island off the coast, in the middle of an estuary formed by two small rivers, in lat. 4° 3′ s., and long. 39° 43′ e., about 150 m. n. of Zanzibar island. The shores of the island are rocky and abrupt; and, although the channel may be forded at low water, the attempt is attended with danger. The town has the usual Arab characteristics of ruin, neglect, and filth in a striking degree. The chief object of interest is an extensive fort, built on a rock, cut perpendicularly, in 1596, by the Portuguese, and restored by them in 1635, as an inscription over the principal gateway indicates. There are also the offices and workshops of the British East Africa Company, and a new European hospital. The inhabitants, the majority of whom are sunk in abject poverty, mostly live in wretched hovels, scattered among what remains of the once magnificent buildings. The town and island of Mombassa, as well as the surrounding district, is inhabited by the Wanika tribe. The harbor is still good, has an iron pier and a stone wharf. Mombassa was visited by Vasco da Gama in 1497, when he found it to be a large and very prosperous town. It was held by the Portuguese during the greater part of the period from 1529 to 1698, when it appears to have become independent. The English held it from 1824 to 1826, when they resigned it. It was ceded forever, in 1891, to the Imperial British East Africa Company. Burton says that the inhabitants of Mombassa "are justly taxed with pride, bigotry, evil-speaking, insolence, turbulence, and treachery by other Arabs." Pop. estimated 15,000 to 20,000.

MOMENT, of any physical agency, is its importance with reference to some special application. Thus, the moment of a force applied (perpendicularly) to a lever, is the importance of the force as regards turning the lever about its fulcrum. It is, as we know (see LEVER), proportional to the product of the force by the distance of its point of application from the fulcrum. The moment of a force about any axis (to which its direction is perpendicular) is the product of the force by its least distance from the axis; and a similar definition is laid down for moment of velocity and moment of momentum. It is easy to see (see MOMENTUM) that in any system of mutually acting bodies the moment of momentum about any axis remains constant, since the equal mutual forces measure the momentum transferred from one body to another, and the moments of these forces are in pairs equal and opposite. A particular case of this is Kepler's law, that each planet describes equal areas in equal times about the sun.

Moment of Inertia.—In the rotation of bodies round an axis, the moment of inertia is the sum of the products of each particle of the body into the square of its distance from the axis; or if M be the body, m_1, m_2, m_3, etc., the particles composing it, and r_1, r_2, r_3, etc., their corresponding distances from the axis, then the moment of inertia of M $= m_1 r_1^2 + m_2 r_2^2 + m_3 r_3^2 +$, etc.; and if a quantity, k, be found such that $Mk^2 = m_1 r_1^2 + m_2 r_2^2 + m_3 r_3^2 +$, etc., then k is called the *radius of gyration*. See CENTER OF GYRATION.

MOMENTUM, or QUANTITY OF MOTION, is defined by Newton as proportional to the mass moving, and its velocity, conjointly. If we assume unit of momentum to be that of unit of mass moving with unit of velocity, we shall evidently have, for the momentum of a mass M, moving with velocity V, the expression MV. And such is the unit generally adopted.

It is shown by experiment that, when force produces motion in any body, the momentum produced in one second is proportional to the force—and, in fact, *force is measured by the momentum it is capable of producing in unit of time.* Thus, the same force, if acting for one second on each of a number of bodies, produces in them velocities which are *inversely* as their masses. Also when, as in the case of falling bodies, the velocities produced in one second are the same in all, we conclude that the forces are *proportional* to the masses; and, in fact, this is the physical proof that the weight of a body is proportional to its mass. Again, if different forces act, each for a second, on the *same* mass, the velocities produced are proportional to the forces. All these are but different modes of statement of the experimental fact that force is proportional to the momentum it produces in unit of time; which forms a part of Newton's second law of motion.

When two masses act on each other, Newton's third law of motion (see MOTION, LAWS OF) shows that the forces they mutually exert are equal and opposite. The momenta produced by these must therefore be equal and opposite. Thus, in attraction or impact of two masses, *no momentum is lost;* since what is lost by one is gained by the other.

The momentum of a system of bodies can be resolved (as velocity is resolved) into components in any assigned directions, and the mutual forces of the system may be thus likewise resolved. Applying the previous result, we see at once that in any system of mutually acting bodies (such, for instance, as the solar system), no momentum is, on the whole, either gained or lost in any particular direction; it is merely transferred from one part of the system to another.

This fact, called the conservation of momentum, has caused great confusion in the minds of pseudo-physicists, who constantly confound it with conservation of work or energy, a totally different thing.

The momentum produced by a force in any period of time is measured by the product of the force and the *time during which it has acted*—the energy or work done by a force

is measured by the product of the force and the *space through which it has acted.* Momentum is proportional to the simple velocity of a body, and *can never, by any known process, be transformed into anything else.* Energy, when depending on velocity (see FORCE—*Conservation of*), is proportional to the *square* of the velocity, and is in the natural world *constantly being transformed from its actual or kinetic form to its potential form, and back again, or to some other kinetic form, such as heat, and finally must become heat.* Momentum, on the contrary, is never altered, either in kind or in amount.

In *knocking down* a wall, or in staving in the whole side of a ship, the battering-ram of the ancients (when constructed of sufficient mass, and worked by the proper number of men or animals) was probably nearly as effective as the best modern artillery. But in making a *breach* in a wall, or in punching a hole in the armor of an iron-clad, mere massive shot with low velocities (such as those of the Dahlgren guns), are comparatively ineffective, however great their momentum; while an Armstrong or Whitworth projectile, with a fraction of the momentum, but with greater velocity, and, for its size, much greater kinetic energy, effects the object with ease.

In many every-day phenomena, we see most distinctly the difference between these two affections of matter. Thus, a blow delivered from the shoulder by a *heavy* pugilist, even if it be sluggishly given, generally floors its man, without doing much other injury; but a sharp stroke administered by a light weight, while hardly disturbing the adversary's equilibrium, inflicts serious punishment.

MÔMIERS, French for maskers or comedians, is the name given in derision to a sect of evangelical Protestants of Switzerland and adjacent parts of Germany and France, who exhibited an uncommon degree of fervor in their religious services. They charged the national church with apostacy from the reformed faith especially by denying the divinity of Christ. This subjected them to opposition and restraint, so that ultimately, despairing of making progress, they went back to the church. The most distinguished man among them was the Rev. Cæsar H. A. Malan, D.D., who having been brought up among Socinians continued to hold Socinian doctrines after his ordination as a minister in 1810, until in 1817, by means of friendly intercourse and discussion with Robert Haldane of Scotland and Dr. John M. Mason of New York, at that time sojourning at Geneva, he embraced evangelical doctrine, and was, 1820–1863, pastor of an independent congregation of Môtniers.

MOMMSEN, THEODOR, a distinguished writer on the history and polity of ancient Rome, was b. in 1817 at Garding, in Sleswick, where his father was a pastor in the Lutheran church. Mommsen studied first at Altona, and subsequently at the university of Kiel, where he graduated in arts in 1843. Having obtained some assistance from the academy of Berlin to defray the expenses of a prolonged course of travals, Mommsen spent three years in investigating Roman inscriptions in France and Italy, and from time to time published the result of his investigations in the annals of the archæological institute of Rome and the Herculanean academy of Naples. The political disturbances of 1848 diverted Mommsen from his favorite pursuits; and for a time he devoted himself to politics, taking upon himself the editorship of the leading Sleswick-Holstein paper, for which he wrote the leading articles in the summer of 1848. Mommsen was appointed professor of law at Leipsic, but was dismissed on account of his political opinions; was made titular professor of law at Zurich in 1852, and at Breslau in 1854; took the chair of Roman law at Berlin, 1858, and was permanent secretary of the Berlin academy of sciences in 1874–95. His attention has long been devoted to those branches of archæology and ancient history with which his name is now so honorably associated. Among his works are: *Die Unteritalischen Dialekte* (Leip. 1850); *Corpus Inscriptionum Neapolitanarum* (Leip. 1851); his monographs on *The Chronography of the Year 354*, and *Roman Coins* (Leip. 1850); the edict of Diocletian, *De Pretiis Rerum Venalium a. 301* (Leip. 1851); *Inscriptiones Regni Neapolit.-Latinæ* (1852); *Die Rechtsfrage zwischen Cæsar und d. Senat* (1857); his great work on Roman history, *Röm. Geschichte* (fifth edition, 1868–70; ably translated into English by W. P. Dickson); *Römische Forschungen*, articles on special points of Roman antiquities (1st vol., Berlin, 1864); *Römisches Staatsrecht* (1st vol., Leip., 1871); *Die Erzählung von Caius Martius Coriolanus;* and his *Digesta Justiniani Augusti* (Berlin, 1868–70). His valuable library was partially destroyed in 1880.

MOMORDICA, a genus of plants of the natural order *cucurbitaceæ*, having lateral tendrils, and the fruit splitting when ripe. *Momordica balsamina*, a native of the south of Europe and of the east, produces a curious, oblong, much-warted fruit, called the BALSAM APPLE, which, when green, is infused in oil, to form a vulnerary much esteemed in Syria and some other countries. The ripe fruit is a dangerous poison. The plant is used to form arbors.—The large, red, thorny fruit of *momordica mixta*, called *gol-kakra* in India, is there used for food.—*Momordica echinata* is called the *gooseberry gourd*, because its fruit, which is covered with bristles, is about the size and shape of a large gooseberry. The unripe fruit is used for pickling, and is sometimes to be seen in Covent Garden market.

MOMOT, or MOTMOT, the common name for the different species of birds belonging to the genus *prionites* of Illiger. Some have placed the momot as a genus, and it has also been proposed as a family. Its place is, however, rather uncertain. It has been

assigned to the coraciadæ. The genus *prionites* has the following characteristics. Both mandibles slightly curved and compressed; the margins with strong denticulations; tongue long and slender, with the sides ciliated; wings short and rounded; tail long and pointed. Dr. G. R. Gray makes the momotinæ, a sub-family of the *todidæ*, consist of the genus *crypticus* (prionites of Swainson), and the genus *momotus* (prionites of Illiger, momota of Shaw, and rhamphastos of Linnæus).

MOMOTOM'BO, a volcano of the Marabios range, near lake Managua, 25 m. n.e. of Leon in Nicaragua. Its height is 5750 ft., of which more than one-third is composed of the ashes and cinders ejected in past ages. It is still active, but has had no serious eruptions for many years. Among other traditions connected with it is one, embodied in Victor Hugo's *La Légende des Siècles*, which tells of an attempt by Spanish priests to ascend and plant the cross on its summit; they were never heard of afterwards; and the ascent remains to this day unaccomplished.

MOMPOX', a t. of the United States of Colombia, on the Magdalena, 110 m. s.e. of Cartagena. Here the Magdalena, during its periodical floods, rises 12 or 15 ft. above its usual level; and the quay and custom-house of Mompox are built unusually high, in order to provide against this emergency. All the foreign goods destined for the consumption of the valley of the Magdalena pass through this town. Pop. estimated at 10,000.

MOMUS, in fabulous history, the god of raillery, or the jester, who ridiculed both gods and men. He is the personification of mocking censure. Being requested by Vulcan, Neptune, and Minerva, to give his opinion as to their works, he blamed them all: Neptune, for not making his bull with horns before his eyes, in order to give a surer blow; Minerva, for building a house which could not be moved in case of bad neighbors; Vulcan, for making a man without a window in his breast, that his secret thoughts might be seen. Venus alone was blameless. For his free censures of the gods he was expelled from heaven. He is generally represented as raising a mask from his face, and holding a small figure in his hand. He is according to Hesiod the progeny of Night.

MON'ACHISM (Gr. *monachos*, a monk, from *monos*, alone) may in general be described as a state of religious retirement more or less complete, accompanied by contemplation, and by various devotional, ascetical, and penitential practices. It is, in truth, asceticism (q.v.), with the element of religious solitude superadded. The institution of monachism has, under different forms, entered into several religious systems, ancient and modern. That it was known among the Jews before the coming of our Lord, appears from the example of the prophet Elias, and from that of the Essenians; and it is probable that religious seclusion formed part of the practice of the Nazarites (q.v.), at least in the later periods of Jewish history. In the Brahmanical religion, it has had a prominent place; and even to the present day, the *lamaseries* of Thibet may be said to rival in number and extent the monasteries of Italy or Spain. The Christian advocates of monachism find in the gospel exhortations to voluntary poverty (Matt. xix. 21) and to celibacy (1 Cor. vii. 37), at once the justification and the origin of the primitive institution. Its first form appears in the practice of asceticism, of which we find frequent mention in the early part of the 2d century. The primitive ascetics, however, lived among the brethren, and it is only in the following century that the peculiar characteristic of monachism begins to appear. The earliest form of Christian monachism is also the most complete—that already described under the head Anchorites (q.v.); and is commonly believed to have in part originated in the persecutions, from which Christians were forced to retire into deserts and solitary places. The anchorites maintained from choice, after the cessation of the persecutions, the seclusion to which they had originally resorted as an expedient of security; and a later development of the same principle is found in the still more remarkable psychological phenomenon of the celebrated Pillar-saints (q.v.). After a time, however, the necessities of the religious life itself—as the attendance at public worship, the participation of the sacraments, the desire for mutual instruction and edification—led to modifications of the degree and of the nature of the solitude. First came the simplest form of common life, which sought to combine the personal seclusion of individuals with the common exercise of all the public duties; an aggregation of separate cells into the same district, called by the name *Laura*, with a common church, in which all assembled for prayer and public worship. From the union of the common life with personal solitude is derived the name *cenobite* (Gr. *koinos bios*, common life), by which this class of monks is distinguished from the strict solitaries, as the anchorites or eremites, and in which is involved, in addition to the obligations of poverty and chastity, which were vowed by the anchorites, a third obligation of obedience to a superior, which, in conjunction with the two former, has ever since been held to constitute the essence of the religious or monastic life. The first origin of the strictly cenobitical or monastic life has been detailed under the name of Saint Antony (q.v.), who may be regarded as its founder in the east, either by himself or by his disciples So rapid was its progress, that his first disciple, Pachomius (q.v.), lived to find himself the superior of 7,000. In the single district of Nitria, there were no fewer than 50 monasteries (Sozomen, *Eccles. History*, vi. 31), and before long, the civil authorities judged it expedient to place restrictions on their excessive multiplication. It seems to be admitted, that, in the east, where asceticism has always been held in high estimation, the example of Christian monasticism

had a powerful influence in forwarding the progress of Christianity; although it is also certain that the admiration which it excited occasionally led to its natural consequence among the members, by eliciting a spirit of pride and ostentation, and by provoking, sometimes to fanatical excesses of austerity, sometimes to hypocritical simulations of rigor. The abuses which arose, even in the early stages of monachism, are deplored by the very Fathers who are most eloquent in their praises of the institution itself. These abuses prevailed chiefly in a class of monks called *Sarabaitæ*, who lived in small communities of three or four, and sometimes led a wandering and irregular life. On the other hand, a most extraordinary picture is drawn by Theodoret, in his *Religious Histories*, of the rigor and mortification practiced in some of the greater monasteries. The monks were commonly zealots in religion; and much of the bitterness of the religious controversies of the east was due to that unrestrained zeal; and it may be added that the opinions which led to these controversies originated for the most part among the theologians of the cloisters. Most famous among these were an order called *Acœmetæ* (Gr. sleepless), from their maintaining the public services of the church day and night without interruption. See MONOPHYSITES, MONOTHELISM, NESTORIANS, IMAGE-WORSHIP.

It was in the cenobitic rather than the eremetic form that monachism was first introduced into the west, at Rome and in northern Italy by Athanasius, in Africa by St. Augustine, and afterwards in Gaul by St. Martin of Tours. Here also the institute spread rapidly under the same general forms in which it is found in the eastern church; but considerable relaxations were gradually introduced, and it was not until the thorough reformation, and, as it may be called, religious revival effected by the celebrated St. Benedict (q.v.), in the beginning of the 6th c., that western monachism assumed its peculiar and permanent form. In some of the more isolated churches, as, for instance, that of Britain, it would seem that the reformations of St. Benedict were not introduced until a late period ; and in that church as well as in the church of Ireland, they were a subject of considerable controversy. One of the most important modifications of monachism in the west, regarded the nature of the occupation in which the monks were to be engaged during the times not directly devoted to prayer, meditation, or other spiritual exercises. In the east, manual labor formed the chief, if not the sole external occupation prescribed to the monks; it being held as a fundamental principle, that for each individual the main business of life was the sanctification of his own soul. In the west, besides the labor of the hands, mental occupation was also prescribed, not, it is true for all, but for those for whom it was especially calculated. From an early period, therefore, the monasteries of the west, and particularly those of Ireland, or of the colonies, founded by Irish monks, as Iona and Lindisfarne, became schools of learning, and training-houses for the clergy. At a later period, most monasteries possessed a *scriptorium*, or writing-room, in which the monks were employed in the transcription of MSS.; and although a great proportion of the work so done was, as might naturally be expected, in the department of sacred learning, yet it cannot be doubted that it is to the scholars of the cloister we owe the preservation of most of those among the master-pieces of classic literature which have reached our age.

In the remarkable religious movement which characterized the church of the 12th c. (see FRANCIS OF ASSISI, FRANCISCANS), the principle of monachism underwent a further modification. The *spiritual egotism*, so to speak, of the early monachism, which in some sense limited the work of the cloister to the sanctification of the individual, gave place to the more comprehensive range of spiritual duty, which, in the institute of the various bodies of friars (q.v.) which that age produced, made the spiritual and even the temporal necessities of one's neighbor equally with, if not more than, one's own, the object of the work of the cloister. The progress of these various bodies, both in the 12th c. and since that age, is detailed under their several titles. It only remains to detail the later history of monachism, properly so called. The monastic institutes of the west are almost all offshoots or modifications of the Benedictines (q.v.); of these, the most remarkable are the Carthusians, Cistercians, Grandmontines, Clugniacs, Premonstratensians, and above all Maurists, or Benedictines (q.v.) of St. Maur. In more modern times, other institutes have been founded for the service of the sick, for the education of the poor, and other similar works of mercy, which are also classed under the denomination of monks. The most important of these are described under their several heads.

The inclosure within which a community of monks reside is called a monastery (q.v.) —Gr. *monasterion*, Lat. *monasterium*. By the strict law of the church, called the law of cloister or inclosure, it is forbidden to all except members of the order to enter a monastery; and in almost all the orders, this prohibition is rigidly enforced as regards the admission of females to the monasteries of men. To such a length is this carried in the Greek church, that in the celebrated inclosure of Mount Athos, not only women, but all animals of the female sex are rigorously excluded. The first condition of admission to a monastic order is the approval of the superior, after which the candidates remain for a short time as *postulants*. After this preliminary trial, they enter on what is called the *novitiate*, the length of which in different orders varies from one to three years; and at its close, they are admitted to the profession, at which the solemn vows are taken. The age for profession has varied at different times and in different orders; the council of Trent, however, has fixed 16 as the minimum age. Originally, all monks were lay-

men; but after a time, the superiors, and by degrees other more meritorious members, were admitted to holy orders. The distinction of priest-monks and lay-brothers has been already explained under the head FRIAR: but in both alike, where the order is one of those solemnly approved by the church, the engagement taken at the final profession is life-long and irrevocable.

The monastic institute, from the very earliest time, embraced women as well as men. The former were called in Greek by the name *nonis* or *nonna*, and in Latin *nonna* (from which the English *nun*), as also *sanctimonialis*. The cloistered residence of nuns is called by various names, as NUNNERY, CONVENT, a name also applied to the houses of men. The general characteristics of the monastic institute for females are substantially identical with those of the male orders; and as the principal varieties of institute are detailed under their respective heads, it is needless to particularize them here.

It is hardly necessary to say that the reformed churches in the 16th c. discarded the practice of monachism, and suppressed the monastic houses. In some of the German states, the temporalities of the suppressed monasteries were retained, and were granted at pleasure by the sovereign, to be enjoyed together with the titular dignity. Some of the German churches, however, in later times, have revived the institute both for men and for women, as has also been done in the Anglican church both in the time of Laud and in our own day. In all these Protestant revivals of monachism, however, the engagement is revocable at the will of the individual. At the French revolution, the monastic establishments of France were utterly suppressed; and in most of the other Catholic countries of Europe the example has been followed to a greater or less extent. In England and Ireland and America, on the contrary, the institute has made rapid progress within the last 20 years. Most of the orders, however, introduced into these countries are of the active class. See illus., PRIESTS, ETC., vol. XII.

MO'NACO, a small principality of Italy, on the coast of the Mediterranean sea, about 9 miles n.e. of the city of Nice. The climate is fine, so that oranges, lemons, etc., are produced in abundance. Pop. '90, 13,304. From the 10th to the 18th c. Monaco was held by the Genoese family of Grimaldi. In 1815 it was ceded to Sardinia, which, however, recognized its independence, but reserved to itself the right of garrisoning the town of Monaco. At this period it consisted of three communes—Monaco, Mentone, and Roccabruna, with an area of 52 sq.m., and a pop. of about 7,000. In 1848 Mentone and Roccabruna were annexed to Sardinia, in spite of a protest by his "serene highness," Carlo Honorio, third prince of Monaco. The Italian war of 1859 placed the whole territory for a brief period under Victor Emmanuel; but Carlo Honorio having sold Mentone and Roccabruna (Feb. 2, 1861) to the French emperor for 4,000,000 francs, Sardinia was obliged to renounce her hold upon them. The sovereign prince of Monaco now possesses nothing but the city and a small patch of territory, with a total area of 6 sq.m. Besides the capital there is the town of Monte Carlo (q.v.), with a population in 1890 of 3794, famous for its gambling hall, and Condamine, with a population of 6218. The principality has no army, but a guard of honor consisting of seventy-five members. Monaco is governed, under the prince, by a governor-general and a Council of State. The revenue is mainly derived from the gaming tables. The principality exports olive oil, oranges, citrons, and perfumes. It is the seat of a Roman Catholic bishop. The town is a beautiful place on a promontory, with 3292 inhabitants.

MO'NAD (Gr. *monas*, unity), a term borrowed from the Peripatetic philosophy, although employed by moderns in a sense different from that of the Peripatetics, who used it to designate the universe, understood in the pantheistic sense. By moderns, and especialy by Leibnitz (q.v.), from whose system alone the name has derived importance, it is used to describe the primary elements of all matter. The monads are simple uncompounded substances, without figure, without extension, without divisibility, by the aggregation of which all bodies are formed, and into which all compounded things may ultimately be resolved. The monads are created things, but as being uncompounded, are indestructible; and although subject to change, the change is but external or relative. They are of two classes—the first are destitute of consciousness, although possessing an internal activity which is called by the name of perception; the second possess, in addition to perception, a certain consciousness, which is called by the name "apperception" or conscious-perception. The monads of this class are souls, and according to the degree of their consciousness is the distinction between the souls of the higher and those of the lower intelligences. The Deity is the PRIME MONAD, or MONAD OF MONADS. The theory of monads enters largely into the philosophic system of Leibnitz, and indeed furnishes the key to much in that system which is otherwise obscure.

MONAD, *Monas*, the generic name of many kinds of microscopic organisms, very minute, and supposed also to be of very simple organization. They appear, even under a powerful microscope, as mere points, moving rapidly through the fluid in which they exist, and often becoming aggregated in clusters; or they are seen to be gelatinous and globular, or nearly so, with a tail or thong-like filament, by the vibrations of which they move. When the fluid is tinted by means of some harmless coloring matter, the existence of several cells or vesicles is discerned within the minute body. Ehrenberg, therefore, classed them among polygastric infusoria (see INFUSORIA), and no naturalist doubted their right to a place, although one of the lowest, in the animal kingdom. They are now universally regarded as vegetable, and are ranked among algæ. The organisms formerly

known as globe animalcules (*volvox*) are clusters of monads produced by gemmation from one, and invested with a common envelope. Monads are of various colors. Their gemmation takes place according to fixed laws, so that the groups assume particular forms, characteristic of the different kinds. Thus, in the "breast-plate animalcule" (*gonium pectorale*), so called from the form which the group frequently presents, a division takes place into four, and the number in a group is always either four or sixteen, a group of sixteen always dividing into four parts, each of which contains four monads. —The minute moving points often seen under the microscope are probably often not monads, but spores or germs.

MONAD'NOCK, GRAND, a mountain in Jaffrey, Cheshire co., N. H., which from a base of 5 by 3 m. rises to a height of 3,186 feet. It is composed of talc, mica, and slate, can be seen from the State house at Boston, and is a landmark at sea. Thirty lakes, some containing numerous islands, can be seen from its summit.

MONA'GAS, JOSÉ TADEO, 1786–1868; b. Venezuela; served under Bolivar in the war of independence, 1810–20. After a number of unsuccessful attempts to overthrow the government, he was chosen to the presidency in 1846. He sent ex-president Paez, against whom he had formerly headed a revolution, into exile, and abrogated the constitution, making himself dictator. He succeeded in maintaining himself in this office till 1859. He declared against and overthrew the government of gen. Falcon in 1868, and was again elected to the presidency, but died before taking his seat.

MONAGHAN, an inland co. of the province of Ulster, Ireland, situated between Tyrone on the n., Armagh and Louth on the e., Meath and Cavan on the s., and Fermanagh on the west. Its greatest length from n. to s. is 37 m.; its greatest breadth e. and w. is 28; the total area being 500 sq. m., or 319,757 acres, of which 121,000 are arable. The population, which in 1861 was 126,340, had fallen in 1891 to 86,206. The general surface is undulatory, the hills, except in the n.w. and e., being of small elevation, although often abrupt; the highest point does not exceed 1254 ft. above the sea. It is interspersed with lakes of small extent, and, although the streams are numerous, there is no navigable river within its boundaries. In its geological structure, the level country belongs to the great central limestone district; the rest is of the same transition formation which is met with in the northern tract of Leinster. No minerals are found in a remunerative quantity; there is a small coal-field in the southern border, but it has not been found profitable to work. The linen industry, formerly important, has now dwindled away. The soil is very varied in its character, and for the most part is wet and imperfectly drained, although commonly capable of much improvement; but in general it is found suitable for the production of cereal crops (with the exception of wheat, which is little cultivated), and of flax. Monaghan is supplied with good roads, and is connected by railway with Dublin, Belfast, and Galway, and directly with the coast at Dundalk. The Ulster canal passes through the county. The principal towns of this county are Monaghan (q.v.) Carrickmacross, Clones, and Castle-Blayney. The 5 baronies are Cremorne, Dartreed, Farney, Monaghan, and Trough. It returns two members to parliament. Monaghan, at the invasion, formed part of the grant of Henry II. to De Courcey, and was partially occupied by him; but it speedily fell back into the hands of the native chiefs of the sept MacMahon, by whom (with some alternations of re-conquest) it was held till the reign of Elizabeth, when it was erected into a shire. Even still, however, the authority of the English was in many places little more than nominal, especially in the north; and in the rising of 1641 the MacMahons again resumed the territorial sovereignty. The historical antiquities of the county are of little interest or importance; there are many remains of the ancient earthworks, commonly referred to the ante-English period.

MONAGHAN, chief t. of the county of the same name, is situated on the great north line from Dublin to Londonderry, distant from the former 76 m. n.n.w. Pop. '91, 2,938. Monaghan, before the union, was a town of some importance, having a charter from James I., and returning two members to the Irish parliament. It is still the center of an active inland trade, and can boast some public buildings of considerable pretensions, among which are the jail, market-house, and court-house. A Roman Catholic college and a cathedral dedicated to St. MacCarthain also deserve special notice. Two markets for agricultural produce are held weekly, and there is also a monthly fair.

MONARCHIANS, "believers in one fountain or source of being," were persons in the early Christian church who did not admit a distinction of persons in the divine Being. Believing strictly in the unity of God, they rejected the orthodox doctrine of the trinity. Traces of their opinions appeared at a very early period of the Christian era, and are alluded to by Justin Martyr as held both by Jews and Christians. He condemns the former for saying that when God communed with the patriarchs it was God the Father who appeared. He makes the same complaint against certain Christians. From this it is manifest that in Justin's day there were nominal Christians, who spoke of the Son as only an unsubstantial energy of the Father. This leading opinion of the monarchians is thought to have been brought into Christianity chiefly through Alexandrian Jews and Gnostics, or, in some instances, to have been derived directly from pagan

philosophy. From pagan religion it could not have come, unless very indirectly, as that took little thought of the unity of God. But whatever its origin, it was embraced by two classes, who differed greatly in their application of the theory; the one, who may be called rationalistic, admitted the divinity of Christ only as being at most a mere power; the other, some of whom were *Patripassians*, identified the Son with the Father, and allowed at most only a trinity of manifestation. "The one," says Schaff, "prejudiced the dignity of the Son, the other the dignity of the Father; yet the latter was by far the more profound and Christian, and accordingly met with the greater acceptance." 1. Those of the first class saw in Christ a mere man filled with divine power; but conceived this divine power as present in him not merely from his baptism, but from the beginning, and admitted his supernatural conception through the Holy Ghost. 2. The second class, whom Tertullian called *Patripassians*, while they professed Unitarian opinions, strove also to hold fast the divinity of Christ; and, as they thought, accomplished their object by merging his independent personality in the essence of the Father. Sabellius, about the middle of the 3d c., denying both trinity of essence and permanent trinity of manifestation, taught that the unity of God, without distinction in itself, after the creation, unfolds itself in the course of the world's development in three different forms and periods of revelation, and after the completion of redemption, returns into unity. The Father (he said) reveals God in the giving of the law and the Old Testament economy; the Son reveals God in the incarnation; and the Holy Ghost reveals God in inspiration. He illustrated this trinity of relations by comparing the Father to the sun, the Son to its enlightening power, and the Spirit to its warming influence. Athanasius pointed out coincidences of thought in the stoic philosophy with the doctrine of Sabellius, which, however, is generally admitted to have been thought out independently in his own mind. He may be regarded as the most original, ingenious, and profound of the monarchians. His system has been revived by Schleiermacher in a very modified form; and is substantially held in still later times by some who, holding to Christ's supreme divinity, deny the union in him of the human and divine natures, and suppose that he was God dwelling in human flesh and subject to its limitations and infirmities. It will be seen that the general principle of monarchianism admits various modifications in theory, and may be pressed in one extreme into a denial of any proper divinity in Christ, and in the opposite extreme to a position scarcely distinguishable from the standard doctrine which has been upheld in the church. See INCARNATION, TRINITY.

MONARCHY (Gr. *monarchia*, from *monos*, alone, and *archō*, to govern; literally, the government of a single individual) is that form of government in a community by which one person exercises the sovereign authority. It is only when the king, or chief magistrate of the community, possesses the entire ruling power that he is, in the proper acceptation of the term, a monarch. Most of the oriental governments past and present, Russia at present, and Spain and France as they were in the last century, are in this strict sense monarchies. The degenerate form of monarchy is tyranny, or government for the exclusive benefit of the ruler. When the head of the state, still possessing the status and dignity of royalty, shares the supreme power with a class of nobles, with a popular body, or with both, as in our own country, the government, though no longer in strictness monarchical, is called in popular language a mixed or limited monarchy, the term absolute monarchy being applied to a government properly monarchical. The highest ideal of government would perhaps be attained by an absolute monarchy, if there were any security for always possessing a thoroughly wise and good monarch; but this condition is obviously unattainable, and a bad despot has it in his power to inflict infinite evil. It therefore becomes desirable that a governing class, composed, if possible, of the wisest and most enlightened in the country, should share the supreme power with the sovereign. A limited monarchy has this advantage over an aristocratic republic that, in difficult crises of the nation's existence, royalty becomes a neutral and guiding power, raised above the accidents and struggles of political life.

Monarchy, most usually hereditary, has sometimes been elective, a condition generally attended with feuds and distractions, as was the case in Poland. The elective system is still followed in the choice of the pope. Constitutional monarchy may be in its origin elective, or combine both systems, as when one family is disinherited, and the scepter declared hereditary in the hands of another under certain conditions. See KING, REPUBLIC, GOVERNMENT.

MONASTERY has been described under the head of Monachism (q.v.) as the generic name of the residence of any body of men, or even, though more rarely, of women, bound by monastic vows. It may be useful, however, to detail the various classes of monastic establishments of the western church, and to point out the leading characteristics of each. The name, in its most strict acceptation, is confined to the residences of monks, properly so called, or of nuns of the cognate orders (as the Benedictine), and as such, it comprises two great classes, the *abbey* and the *priory*. The former name was given only to establishments of the highest rank, governed by an abbot, who was commonly assisted by a prior, sub-prior, and other minor functionaries. An abbey always included a church, and the English word *minster*, although, like the cognate German *münster*, it has now lost its specific application, has its origin in the Latin *monasterium*. A *priory* supposed a less extensive and less numerous community. It was governed by

a prior, and was originally, although by no means uniformly, at least in later times, subject to the jurisdiction of an abbey. Many priories possessed extensive territorial domains, and of these, not a few became entirely independent. The distinction of abbey and priory is found equally among the Benedictine nuns. In the military orders, the name of *commandery* and *preceptory* corresponded with those of abbey and priory in the monastic orders. The establishments of the mendicant, and, in general, of the modern orders, are sometimes, though less properly, called monasteries. Their more characteristic appellation is *friary* or *convent*, and they are commonly distinguished into *professed houses* (called also *residences*), *novitiates*, and *colleges*, or *scholastic houses*. The names of the superiors of such houses differ in the different orders. The common name is *rector*, but in some orders the superior is called *guardian* (as in the Franciscan), or *master*, *major*, *father superior*, etc. The houses of females—except in the Benedictine or Cistercian orders—are called indifferently *convent* and *nunnery*, the head of which is styled *mother superior*, or *reverend mother*. The name *cloister* properly means the inclosure; but it is popularly used to designate, sometimes the arcaded ambulatory which runs around the inner court of the building, sometimes, in the more general sense, of the entire building, when it may be considered as synonymous with *convent*.

MONASTIR', Toli-Monastir, or Bitolia, a t. of European Turkey, capital of the vilayet named after it, is situated in a broad valley of the Niji mountains, 90 m. n.n.e. of Janina, and about the same distance w.n.w. of Saloniki. It is an important place, is the residence of the governor-general, and commands the routes between Macedonia and northern Albania. The inhabitants are mostly Greeks and Bulgarians. Monastir has 11 mosques, and carries on a large trade with Constantinople, Saloniki, Vienna, and Trieste. Its bazars are well stocked with the products of western Europe and the colonies, as also with native manufactures. It has barracks, military hospital and cadet school. Pop. 50,000, of whom two-fifths are Mohammedans.

MONASTIR, a seaport t. of north Africa, in the dominion of Tunis, 80 m. s.s.e. of the city of that name, on the gulf of Sidra. Woolen and camlet fabrics are manufactured, and there is some maritime trade. Pop. estimated at 6,000.

MONBODDO, James Burnet, Lord, a Scottish lawyer and author, was b. at Monboddo, in Kincardineshire, in 1714, educated at Marischal college, Aberdeen, where he displayed a great fondness for the Greek philosophers, and afterwards studied law for 3 years at Groningen, in Holland. In 1737 he became a member of the Scottish bar, and soon obtained considerable practice; but the first thing that brought him prominently into notice was his connection with the celebrated Douglas case, in which Mr. Burnet acted as counsel for Mr. Douglas. In 1767 he was raised to the bench by the title of lord Monboddo. He died May 26, 1799. Monboddo's first work, on the *Origin and Progress of Language* (1771–76), is a very learned, heretical, and eccentric production; yet in the midst of its grotesque crotchets there occasionally flashes out a wonderfully acute observation, that makes one regret the distorted and misapplied talent of the author. The notion that men have sprung from monkeys, is perhaps that which is most commonly associated with the name of Monboddo, who gravely asserted that the orang-outangs are members of the human species, and that in the bay of Bengal there exists a nation of human creatures with tails, and that we have only worn away ours by sitting on them, but that the stumps may still be felt. Monboddo wrote another work, entitled *Ancient Metaphysics*, which was published only a few weeks before his death.

MONBUTTOO, a country in central Africa, between 3° and 4° n. lat., and 28° and 29° e. long.; 4000 sq.m.; estimated pop. '91, 1,000,000. It is an elevated table-land, 2,500 ft. above the sea. The Keebaly and Gadda rivers flow through it, uniting to form the Welle, which, after a westerly course through s. Nyam-Nyam, joins the Shary, the source of lake Tchad. The soil spontaneously produces so many fruits and edible roots that cultivation is small, restricted for the most part to tobacco, sugar cane, and sesame. There are few domestic animals. The inhabitants are lighter colored than the surrounding nations; they are cannibals, fond of the chase, and skillful in the working of copper, iron, and wood. Polygamy and circumcision are practiced. The art of weaving is unknown. There is a considerable trade in ivory.

MONCÁDA, Don Francisco de, Conde de Osona, an historian and one of the Spanish classics, b. Dec. 29, 1586, at Valencia, where his grandfather was then viceroy. Descended from one of the greatest families of Catalonia, he rapidly rose to the highest offices in the state, was ambassador to Vienna, and latterly governor of the Netherlands, and commander-in-chief of the Spanish troops there. He distinguished himself both as a statesman and a soldier. He fell at the siege of Goch, a fortress in the duchy of Cleves, in 1635. His *Historia de la Expedicion de Catalones y Aragoneses contra Turcos y Griegos* (Barcelona, 1623, and frequently reprinted), is a masterpiece in liveliness and elegance of style.

MONCALIE'RI, a t. of Italy, in the province of Turin, situated finely on the slope of a hill, on the right bank of the Po, 5 m. above Turin. Pop. 3,030. Moncalieri is the first railway station between Turin and Genoa, and communicates daily with Turin by frequent omnibuses; it has fine buildings, including a palace lately embellished for the

residence of king Victor Emmanuel. The annual cattle-fair held in October at Moncalieri is the most important of the north of Italy.

MONCK, a co. in s. Ontario, on lake Erie; 373 sq. m.; pop. 15,315. The Grand Trunk, and the Michigan Central railroads pass through it.

MONCK, Charles Stanley, Viscount, b. Ireland, 1819; educated at Trinity college, Dublin, and called to the Irish bar in 1841. He was elected to parliament as a liberal member for Portsmouth in 1852, and re-elected in 1855, but was unsuccessful in 1857. He was a lord of the treasury from 1855 to 1858, and was appointed governor-general of Canada in 1861. He was reappointed in 1867, but resigned the next year. In 1871 he served on the Irish national education commission, and on the commission to carry out the act for the disestablishment of the Irish church. He succeeded his father as viscount in the Irish peerage in 1849, and was made a viscount in the peerage of Great Britain in 1866. He d. in 1894.

MONCREIFF-WELLWOOD, Sir Henry, 1750–1827; b. Scotland; son of the Rev. Sir William Moncreiff, and assumed the additional name of Wellwood late in life. Having been educated at Glasgow and Edinburgh, he was ordained, 1771, as successor to his father at Blackford, and continued there until 1775, when he became minister of St. Cuthbert's, Edinburgh. Always a member of the evangelical party in the church, he became at length its leader. His published works are: *Discourses on the Evidence of the Jewish and Christian Revelations; The Life and Writings of Dr. John Erskine;* and *Sermons*, 3 vols.

MONCTON, a town and port of entry in Westmoreland co., New Brunswick, Canada; on the Petitcodiac river and the Intercolonial railroad; 89 m. n.e. of St. John. It is at the head of river navigation, and has a fine harbor, several hotels, cotton, flour, and planing mills, manufactories of steam engines, machinery, leather, iron castings, and wooden ware, the general offices and principal shops of the Intercolonial railroad, branch banks, daily and weekly newspapers, and a large trade in lumber and agricultural products. Pop. '91, 8,762.

MONDAY (Ger. *Montag*, Lat. *Lunæ Dies*, the day of the moon, Fr. *Lundi*), the second day of the week. The name descends from the Romans, who named the days of the week after the planets.

MONDOÑE'DO, a t. in Galicia, Spain, 30 m. n.n.e. of Lugo; pop. comm. 10,400. It has a cathedral and a castle. There are tanneries, and manufactures of cotton cloth, and linen.

MONDO'VI, an episcopal t. in Cuneo, one of the northern provinces of Italy, situated on the summit and shoulder of an Alpine hill, 42 m. s. of Turin. It is divided into four sections: the Piazza—encircled by walls, and containing the chief buildings of the place, and the suburbs, Carassone, Breo, and Piano del Valle. In the neighborhood considerable activity exists in cloth, silk, and bonnet-straw manufactories; but in spite of vineyards and chestnut woods, the numerous remains of ruined buildings in its vicinity impart an air of desolation to the locality. The Piazza contains a fine cathedral, with rich paintings; an episcopal palace, with a noble gallery of portraits; and the various judicial and educational halls. Pop. about 5200. At the battle of Mondovi, on April 21, 1796, the Sardinians were totally defeated by Bonaparte, and the entrance into Piedmont secured to the French army. The province of Mondovi is intersected by spurs of the Alps, and contains rich marble quarries and valuable mineral products.

MONE'SIA BARK, the bark of a tree, *chrysophyllum glycyphlœum*, or *C. Buranheim*, of the same genus with the star apple (q. v.), a native of the s. of Brazil. The bark is lactescent; but when dried, it is thick, flat, compact, heavy, brown, and hard, with a taste at first sweet, afterwards astringent and bitter. A substance called *monesia* is extracted from it, which is almost black, at first sweet, then astringent, and finally acrid. It is used as a stomachic and alterative in leucorrhœa, chronic diarrhœa, etc. It contains, in small quantity, a principle called *monesin*.

MONETARY COMMISSION of the U. S. Congress. The unexpected fall in the value of silver within a few years after the act of February 12th, 1873, became the subject of general discussion in the United States. It was the source of much debate in the 44th Congress, and in August, 1876, a joint resolution was passed for the appointment of a commission of three senators and three representatives, together with experts chosen by the former, to inquire "First, Into the change which has taken place in the relative value of gold and silver; the causes thereof, whether permanent or otherwise; the effects thereof upon trade, commerce, finance, and the productive interests of the country, and upon the standard of value in this and foreign countries. Second, Into the policy of the restoration of the double standard in this country; and, if restored, what the legal relation of the two coins, silver and gold, should be. Third, Into the policy of continuing legal tender notes concurrently with the metallic standards, and the effect thereof upon the labor, industries and wealth of the country. Fourth, Into the best means for providing for facilitating the resumption of specie payments." The commission as organized consisted of senators John P. Jones, Lewis V. Bogy and George S. Boutwell; representatives, Randall L. Gibson, George Willard, and Richard P. Bland. William

S. Groesbeck of Ohio and Professor Francis Bowen of Massachusetts were the expert members of the commission, and George M. Weston of Maine was appointed its secretary. The meetings of the commission were held in New York and Washington in the winter of 1876–7. Information bearing on the subject of discussion was obtained from all available quarters, and the report which was submitted in March, 1877, was a most valuable compendium of facts and monetary theories. The conclusions of the commission were not unanimous. The majority declared that the recent production of silver relatively to gold had not been greater than formerly, but that the decline in the value of silver had resulted mainly from the demonetization of silver in Germany, United States, and the Scandinavian states, the closure of the mints of Europe to its coinage, the temporary diminution of the Asiatic demand, the exaggeration of the yield of the Nevada silver mines, and the fear of further action against silver coinage by the governments. The policy of adopting the gold standard was condemned in severe terms, and the unrestricted coinage of both metals was recommended. The report further stated that an attempt to introduce monometallism would result in a ruinous contest for a gold standard with the European nations, while if silver were remonetized by the United States the effect would be to attract that metal from other countries while it was cheap, in exchange for what the United States had to export; and that the latter country would thus have the benefit of the rise which the commission believed would take place in its value when the temporary causes of its depression had passed. Mr. Boutwell made a minority report against remonetization of silver except on the basis of international agreement, and Professor Francis Bowen dissented from the majority report arguing in general for the gold basis alone, but declaring in favor of the remonetization of silver on adding to the quantity of pure silver in a dollar enough to make its bullion value equal to the then value of gold per dollar.

The government published a summary of this report together with papers prepared for the commission on "Asiatic trade and flow of silver to the East;" "Constitutional powers of Congress and the States with respect to metallic money;" "Legislation on subsidiary silver coin;" and "the trade dollar." In addition to these the government published a collection of valuable statistics gathered by the commission relating to the production, distribution and relative value of the two metals and to the monetary systems of foreign countries. The written and oral answers of financiers and business men in the United States and Europe in reply to a series of questions agreed upon by the commission were published in a separate volume.

MONETARY CONFERENCES, INTERNATIONAL. Several important conferences of the representatives of the United States and European countries have been held to discuss plans for improving the monetary standards of the world. The first of these, held in 1867, had for its object an agreement upon a common international coin. It failed of its purpose, but demonstrated the value of an international exchange of views on monetary matters, and paved the way for further conferences of this nature. The next three conferences, held in 1878, 1881, and 1892 respectively, were called to discuss the specific question of the remonetization of silver. The conference of 1878 was held in accordance with the following provisions of the Allison act of the United States congress (Feb. 28, 1878): "That immediately after the passage of this act, the president shall invite the governments of the countries composing the Latin Union, so called, and of such other European nations as he may deem advisable, to join the United States in a conference to adopt a common ratio between gold and silver for the purpose of establishing internationally the use of bimetallic money, and securing fixity of relative value between those metals; such conference to be held at such place in Europe or the United States, at such time within six months as may be mutually agreed upon by the executives of the governments joining in the same, whenever the governments so invited or any three of them shall signify their willingness to unite in the same." The section further provided that the president should appoint three commissioners to the conference. Ex-Governor Reuben E. Fenton of N. Y., William S. Groesbeck of Ohio, and Professor Francis A. Walker of New Haven were appointed. To these was added, as secretary to the delegation, S. Dana Horton of Ohio. Paris was chosen as the place of conference. Besides the United States, the following nations were represented: Austria-Hungary, Belgium, France, Great Britain, Greece, Italy, the Netherlands, Russia, Sweden, Norway and Switzerland. Germany declined to participate in the conference, though a second time invited.

The conference opened its session August 10, 1878, and Léon Say was made president and Mr. Fenton vice-president. At Mr. Say's suggestion that questions of facts should precede those of theory, the session closed with the understanding that the delegations should come to the next meeting prepared with full statistics of the monetary condition of their respective states. At the second session, August 16, all the required documents were submitted. Mr. Groesbeck said that the object of the conference was "to restore silver to its former position; to equalize gold and silver upon a ratio to be fixed upon agreement." He submitted the following proposition to the conference. "1. It is the opinion of this assembly that it is not to be desired that silver should be excluded from free coinage in Europe and the United States of America. On the contrary the assembly believe it is desirable that the unrestricted coinage of silver and its use as money of unlimited legal tender should be retained where they exist, and as far as practicable restored where they have ceased to exist. 2. The use of both gold and silver as unlim-

ited legal tender money may be safely adopted. First, by equalizing them at a relation to be fixed by international agreement; and secondly, by granting to each metal, at the relation fixed, equal terms of coinage, making no discrimination between them."

The opposition to these propositions proceeded in the main from a belief that the action proposed was premature. Mr. Goschen, the representative of England, said that "the United States invited the delegates to adopt a proposition which some of them were precluded from entertaining"—as they could not vote to compromise the existing standards of their countries—"but there was one part of the American propositions for which almost all the delegates could vote, and for which, as a principle, personally, he would willingly subscribe; viz., that it is not desirable that silver cease to be one of the money metals. . . . Though England had a gold standard she had great interest in the maintenance of silver as currency. She had a more defined and less compromised position for the discussion of this question than other countries, for she had borne the depreciation of silver in India without trying to shut her doors upon it. Holland half shut hers, while England had allowed it to take its natural course and for five years had borne all the burden resulting therefrom." The representative of Austria-Hungary said that he could subscribe to the propositions of the United States, but since the advantage of this system depended upon a general adoption of it, his government was compelled to maintain an attitude of expectancy. This attitude of expectancy was the position taken by France and most of the other countries represented. Switzerland, however, declared herself, through her representative, decisively for the single gold standard; not for all nations, but "for the advanced nations, and leave silver for countries whose civilization is backward or stationary." Italy on the other hand, through her representatives, was decisively in favor of the American proposition.

The American delegates stated their case well and maintained it by able arguments, but did not succeed in convincing the others of the advisability of adopting the course proposed. The response of the delegates of European states was as follows: "The delegates of the European states represented in the conference desire to express their sincere thanks to the government of the United States for having procured an international exchange of opinion upon a subject of so much importance as the monetary question. Having maturely considered the proposals of the representatives of the United States, they recognized: 1. That it is necessary to maintain in the world the monetary functions of silver as well as those of gold, but the selection for use of one or the other of the two metals or of both simultaneously should be governed by the special position of each state or group of states. 2. That the question of the restriction of the coinage of silver should equally be left to the discretion of each state or group of states according to the particular circumstances in which they may find themselves placed; and the more so in that the disturbance produced during the recent years in the silver market has variously affected the monetary situation of the several countries. 3. That the differences of opinion which have appeared and the fact that even some of the states which have the double standard find it impossible to enter into a mutual engagement with regard to the free coinage of silver exclude the discussion of the adoption of a common ratio between the two metals." The representatives of Italy entered the following protest against the response of the majority: "1. That by the adoption of the formula proposed the conference does not respond to the question that was put to it, and that in systematically avoiding to pronounce itself upon the possibility or impossibility of a fixed relation to be established by way of international treaty between coins of gold and silver it leaves its task unfinished. 2. That since the French law established such a relation (1785) between the two metals, the oscillations of their relative value have been without importance, whatever had been the production of the mines. 3. That, consequently, *a fortiori* if the law of France had been alone able to accomplish the result, then on the day when France, England, and the United States by international legislation should agree to establish together the relation of value of the two metals, this relation would be established upon a basis so solid as to become unshakable." The practical work of the conference closed with a reading of the rejoinder of the American delegates to the response of the majority. Regret was expressed that the majority were unable to concur in the propositions offered and it was hoped that the difficulties in the way of such concurrence would be removed in the future. The conference resulted in nothing of practical value except the illumination of the subject by an international exchange of views. The report of this conference, prepared by S. Dana Horton, can be found in volume 5 of the executive documents of the United States, printed by order of the senate in the third session of the 45th congress, 1878–79.

The conference of 1878 having accomplished nothing definite, the French government took steps to secure another meeting. France and the other members of the Latin Union, although they had discontinued the coinage of silver, were anxious to prevent the further decline in value of that metal. This policy was favored by the U. S. government, which was still issuing silver dollars under the Allison Act. On the other hand, Germany and Great Britain showed no desire to depart from the monometallic system and the former nation was still selling her surplus stock of silver. France attempted to secure a monetary conference in Paris in November, 1880. She failed in this, but obtained the co-operation of the United States, and in the following year a joint invitation was sent out in the name of both governments for an international monetary conference. The object as stated in this invitation was to discuss "the question of

establishing internationally the use of gold and silver as bimetallic money, and securing fixity of relative value between those metals." The countries represented in this conference, which met at Paris, April 19, 1881, were as follows: Austria-Hungary, Belgium, Denmark, Greece, the Netherlands, Portugal, Sweden, Norway, Spain, Switzerland, the United States, France, Great Britain, British India, Canada, Italy and Russia. The delegates from the United States were Mr. Evarts, Mr. Thurman, Mr. Howe and Mr. Dana Horton. The conference held thirteen sessions between April 19 and July 8, 1881. The majority of the delegates were restricted by instructions from their governments, preventing them from voting on definite propositions and in some instances from taking part in the discussion. The German delegates declared that their government sympathized with the object of the conference, and approved of the plan for the restoration of silver to its place as a money metal through free coinage by a certain number of the more populous nations, which should adopt a common ratio. Yet Germany would not herself take part in any plan looking to the establishment of international bimetallism. Nevertheless she would aid in the furtherance of such a plan by agreeing to abstain from the sale of silver for a term of years, and to limit the sale of that metal during another term of years to so small an amount per annum as not to affect the market. The representative of British India declared that he could not commit his government to bimetallism. Yet if it were desired by the other Powers, his government would agree not to do anything to lower the price of silver for a period not to exceed ten years, provided a number of the principal states would open their mints to free coinage of silver at the ratio of 15½ to 1. The representative of Great Britain was present merely out of deference to the inviting Powers. His government gave him no power to "alter the limits now imposed by law upon the use of silver as currency." The Canadian representative could vote in the conference, but expressly stated that his action would not bind his government. The representative of Denmark was directed to abstain from a discussion, his government having declared that it had no desire to abandon the gold basis. The representatives of Russia, Portugal, Sweden, Norway, Austria-Hungary, Switzerland and Greece reserved to their governments complete liberty of action, whatever the decision of the conference should be.

The questions submitted to the conference were as follows: —

"1. Have the diminution and great oscillation in the value of silver, which have occurred especially in late years, been injurious to commerce and consequently to the general prosperity? Is it desirable that the relation of value between the two metals should possess a high degree of stability.

"2. Should the phenomena referred to in the first part of the preceding question be attributed to increase in the production of silver, or to acts of legislation?

"3. Is it, or is it not, probable that, if a large number of states should agree to the free and unlimited mintage of lawful coins of the two metals, with full legal tender faculty, at a uniform ratio between the gold and silver contained in the monetary unit of each metal, a stability in the relative value of these metals would be obtained, which, if not absolute, would at least be very substantial?

"If so, what measures should be taken to reduce to a minimum the oscillation in the relative value of the two metals? For instance: (a) Would it be desirable to impose upon privileged banks of issue the obligation to receive at a fixed price, any gold and silver bullion which the public might offer? (b) How could the same advantage be secured to the public in countries where privileged banks of issue do not exist? (c) Should coinage be gratuitous or at least uniform for the two metals in all countries? (d) Should there be an understanding that international trade in the precious metals should be left free from all restriction?

"5. In adopting bimetallism what should be the ratio between the rate of pure gold and of pure silver contained in the monetary units?"

The representative of Holland made a speech advocating international bimetallism. The Italian delegate declared that Italy was represented in the conference for the purpose of sustaining the interest of bimetallism and he hoped that the conference would not adjourn "without having voted a motion affirming the necessity of doing something in the interest of the rehabilitation of silver, with the proportion of 1 to 15½." Of the several propositions advanced, that suggested by the German delegate looked to an agreement between the United States, France, Italy and Holland to an unlimited coinage of silver at the ratio of 15½ to 1. Other states were to aid in maintaining that ratio by following certain relations and, for example, not coining gold in denominations lower than ten francs. One of the great questions involved in any plan for the introduction of international bimetallism is: What combination of states would suffice to maintain the two metals at a given ratio? In a declaration made to the conference by the French and American delegates, it was stated, "Without considering the effect which might be produced by a lesser combination of states, a combination which should include England, France, Germany and the United States with the concurrence of the other states both in Europe and on the American continent, which this combination would insure, would be adequate to produce and maintain throughout the commercial world the relation between the two metals that such a combination should adopt."

The next conference was held at Brussels, Nov. 22, 1892, at the invitation of the President of the United States "for the purpose of considering what measures, if any, can be taken to increase the use of silver in the currency systems of nations." The

nations represented were the United States, Austria-Hungary, Belgium, France, Germany, Great Britain, Denmark, the Netherlands, Norway, Sweden, Spain, Portugal, Switzerland, Russia, Greece, Roumania, Italy, British India, Turkey, and Mexico. The representatives of the United States were E. H. Terrell, W. B. Allison, J. P. Jones, J. B. McCreary, H. W. Cannon and E. Benjamin Andrews. As in preceding conferences, many of the delegates came hampered by instructions from their government, preventing them from voting and in some instances from even participating in the discussion. Thus, the German government prescribed to her delegates "a most strict reserve." The representative of Austria-Hungary was merely a spectator. The Russian delegate was not allowed to vote on any definite proposition. The representatives of Roumania, Portugal, Turkey and Greece could neither discuss nor vote, while the Italian and Belgian members of the conference stated that they could not take any action independently of the other members of the Latin Union. The French representative said that his country would not accede to any proposition to increase the amount of silver, which was already depreciated and of which she had a great stock.

The discussions of the conference may be divided into those relating to the theoretical questions of bimetallism, and those dealing with the practical propositions offered by various delegates. Among the arguments for and against the theory of bimetallism the following may be mentioned: The advocates of the bimetallic system stated that the need of a change in the monetary standards was apparent from the fact that gold had steadily appreciated during the previous thirty years, resulting in a fall of prices most injurious to the economic interests of the world. This point was then discussed at length, the bimetallists maintaining that as general prices had not fallen in countries having the silver standard, e.g. India and Mexico, the decline must have been due to the appreciation of gold. Mr. Andrews, of the U. S. delegation, said silver must be restored to its position as a standard of payments in order to stay "the fall of general prices which for nearly thirty years has infected with miasma the economic life-blood of the whole world." This fall in prices was not caused by the intrinsic cheapening of goods, but merely by the insufficiency of the monetary medium for the needs of trade. The intrinsic cheapening of goods was a blessing, but a general fall of prices proceeding from the insufficiency of currency was a curse. On the other hand, his opponents held that the fall of prices was to be attributed to the increase of production of the world's goods. They pointed to the fact that the production of cotton, wool, cereals, etc., had greatly increased in the past ten years. Moreover, they said that the bimetallists took no account of the increased area of cultivation on account of the settlement of heretofore unoccupied lands in America and in the Antipodes. Again, prices had gone up and down since 1873 just as before, showing that they resulted from the alternate abundance and scarcity of products, not from the change in the amount of the precious metals. It was not true that gold had appreciated on account of scarcity. The gold reserve of banks of issue had increased by 2,661 millions of francs from 1881 to 1891. Commerce had not been hampered by the scarcity of the precious metals, as was evident from the fact that the exports and imports of three great nations, viz., Great Britain, France and the United States, had increased by 3,000 millions of francs from 1880 to 1890. As to the argument that low prices had followed from increased production and were therefore the sign of plenty and prosperity rather than of restriction of trade and industry, it was stated that during recent years the world had passed through anything but a period of prosperity. Again, that gold was scarce was apparent from the fact that the Bank of France, though having a large stock of gold, made difficulties about paying it out, and the question was asked why should the Bank of England borrow 3 million pounds of gold from the Bank of France if there was no fear of a scarcity of that metal. Mr. B. Currie, one of the British representatives, said that he could see no serious evil in the disuse of silver as a monetary standard, that this disuse was the result of natural selection and could not be arrested by artificial means. "Cheap goods, not dear goods, plenty not scarcity, have always been held to be the conditions of profitable trade." He did not believe that the scarcity of gold had caused the fall of prices. The wealth of a nation did not depend on the amount of silver and gold that it possessed. On the contrary, the more prosperous a nation is, the less use it has for the precious metals. The representative of Switzerland held that the evils arising from the depreciation of silver had been exaggerated. He said that the foreign trade of India had more than doubled since 1872, and that the British manufacturers had exported more than double the amount of cotton goods to India. Mr. Zeppa, the Italian delegate, said that an inevitable law had driven people to monometallism. The civilized nations had been under the régime of a paper currency, and when specie payments were resumed people were unwilling to accept the heavier metal. The demonetization of silver had emphasized this reluctance and further depreciated that metal. Mr. Forssell, of Sweden, made a vigorous attack upon the bimetallist doctrine, saying that, although the theory itself was not new, the imposition upon states by international agreement of a double standard and free coinage, was absolutely new and unknown both in theory and practice. At the very moment when the distrust of silver was greatest, it was asked that the governments should coin this metal in unlimited quantities. He denied that the legal ratio of 15½ to 1 had kept the metals at a parity; for as a matter of fact an actual market ratio had not been invariably in accord with the legal ratio. The bimetallic system can never overcome the preference of man-

kind for gold. It can never avert the danger of a premium on gold. At most, the specie-paying countries of America and Europe would be united in the bimetallic association. It would be impossible to bring in the countries of the far East which have a single standard of silver. The influence of these outside countries must be reckoned with, and so must the danger that one member of the union might renounce the treaty. He said it was an ingenious scheme for creating a reservoir so extensive that beyond it there would be no country capable of attracting gold. He held that there would always be a drain out of this reservoir, and likened the system to an attempt to make a hogshead of such a size that it would contain a fixed quantity of liquid when there was no possibility of stopping the bunghole. Bimetallism obliged people to take silver in unlimited quantities, thus assigning it to a legal monetary function in excess of its natural monetary function. The first effect of universal free coinage would be a rise in the price of silver. This, however, would stimulate the production of silver and check its use in the industrial arts. The preference of the people would not be altered and the flow of silver from the mint would be in excess of the monetary demand. A premium on gold would inevitably result; but such a premium, however small, means the downfall of universal bimetallism. Each nation in the union would try to protect itself, free coinage would be suspended, and the system overthrown. The states of the Latin Union thought they could introduce a bimetallic system at the ratio of 15½ to 1, but the result has shown the futility of the attempt and the members of the Latin Union no longer approve the treaty of 1865. Mr. Jones, of the U. S., gave a very extended argument in favor of bimetallism which fills fifty folio pages. The scope of his paper was theoretical rather than practical and pressed the points usually urged by bimetallists. See Bimetallism.

The discussion of the practical proposals laid before the conference showed a great variety of views. Among these proposals were first the plan that Moritz Levy had brought before the conference of 1881. This proposed to withdraw from circulation gold and paper currency of lower denominations than twenty francs in order to open the way for the circulation of silver or silver certificates; second, Soetbeer's plan, the same as the preceding in essentials, but differing from it in minor technical points; third, the plan of Mr. de Rothschild, one of the representatives from Great Britain. This proposed that the United States should continue buying silver at the present rate, that is, 54 million ounces per annum, and that European powers should combine and make annual purchases to the value of about five million pounds for five years at a price not to exceed forty-three pence per ounce standard, but if silver should rise above that price, the purchases for the time being should be suspended. In regard to the Levy plan, Sir R. Wilson, one of the British delegates, said that his government would object to withdrawing her half-sovereigns from circulation unless the plan were connected with some advantages which a majority of the countries would accept. The representative of Switzerland said it would be impossible to make any more silver circulate in the countries composing the Latin Union; and the Italian representative said that the withdrawal of the Italian state notes of ten francs and five francs, in accordance with the Levy plan, would not make room for more silver, because the silver five-franc pieces now circulating beyond the borders of his country would be called in for domestic circulation. The French representative urged against the Levy plan the fact that France had no bank notes of smaller denominations than fifty francs. The withdrawal of the ten-franc gold pieces from circulation would be opposed by public opinion, and even if it were done there would be no room for further silver circulation, because the bank of France had already more than 1000 millions of francs in five-franc pieces which would take the place of the gold pieces. As to the Rothschild plan, Mr. McCreary, one of the American delegates, said that it was unfair that the United States should continue to buy 54 million ounces of silver bullion each year on condition that the European powers should make yearly purchases amounting to five million pounds sterling for five years at a price not to exceed forty-three pence per ounce. The representative of British India, Sir G. Molesworth, in the course of a speech in favor of international bimetallism, expressed a distrust in the efficacy of the purchase of silver, holding that the Bland Act and similar measures were contrary to the first principles of monetary science. Lieut.-Gen. Strachey, also of British India, opposed the Rothschild plan as not receiving sufficient support from the delegates to give assurance of its being really effective. The representative of France feared that in the distribution of the amount to be purchased by each country too large a share would fall to the French government. France was satisfied with the present system. She had ceased to coin silver on account of the great increase in the volume of that metal. She had now as much as all the other countries put together. Nevertheless, if other countries wished to give up their monometallic system, she would perhaps consent, but the representative said that he could not recommend this step to his government. As the matter stood, with Germany, Austria and Great Britain opposed to any change in their monetary system, the question was settled for France. Mr. Cannon, of the United States, considered the Rothschild plan something more than a mere palliative and had hoped that it might serve to bring the metals to a parity. The majority of the British delegation, i. e. Fremantle, de Rothschild, and Wilson, were radically opposed to any change in the monetary system of their country. Sir Wm. Houldsworth, however, made an earnest plea for bimetallism. Other plans brought up for discussion were the following: Mr. Tietgen, of Den-

mark, proposed that silver should be coined on government account at the market ratio, that the metal thus coined should be a legal tender in the countries coining the same, but that if the market price of silver declined to the extent of 5 %, a committee to be appointed by the present conference should call a new conference to discuss a change in the ratio. All banks should receive these coins on deposit and call on the issuing countries for their redemption in gold. Sir Wm. Houldsworth's proposal was for a universal bimetallic system to be brought about by establishing a bimetallic union. The countries having a gold basis and unwilling to join this union should receive deposits of silver in their mints and give receipts for the same in ounces, specifying the gold value of this bullion at the time of deposit at so much per ounce, the rate to be determined by international agreement. The quantity of silver receipted for should be delivered by weight to bearer upon demand. These receipts should circulate as money, and the loss, if any should arise upon the redemption of these receipts, should fall on last holder. Another plan was that of Mr. Allard, of Belgium. He proposed that international notes should be issued on deposits of silver, the issuing government to indicate the gold value of these deposits at the time of issue. These notes should be legal tender and redeemed by the government in gold at the value indicated, out of a common fund. According to his plan, the loss, if any should arise, was to fall on the governments. Mr. de Foville proposed that silver bullion should be received on deposit by the governments and that certificates should be issued for the same according to weight. These certificates were not to be legal tender, but should be redeemed in the same quantity of silver at the warehouse or mint of the country taking part in the arrangement. The object was to facilitate the exchange of silver.

On Dec. 17, 1892, it was voted that "the conference suspend its labors and decide, should the governments approve, to meet again on the 30th of May, 1893." The conference then adjourned, but, for reasons not made public, did not meet at the time agreed upon. From the foregoing account it is evident that nothing of a practical nature was accomplished by the conference. The interests of the nations represented were too much opposed to admit of an international agreement. It was impossible to agree even in the most moderate proposals in respect to the monetary standard. There was abundant discussion of an academical nature, but the fear of taking a step in advance of other countries and thereby bringing financial disaster upon the country that acted as a pioneer, prevented the delegates from taking any practical action. The attitude of France is perhaps chiefly responsible for the inactivity of the conference. Content with her present system, she was unwilling to run the slightest risk of a change, and preserved, as in the conference of 1878, her "attitude of expectancy." There was no vote taken at the conference which disclosed the real opinion of the majority on the essential question of bimetallism. By general consent they determined not to decide on that matter. They did not even go so far as to discuss the ratio, although in response to inquiry, Mr. Allison, of the American delegation, said that his country would prefer the ratio of 16 to 1, and would accept the ratio of 15½ to 1 if the other countries agreed upon the latter ratio.

MONEY is the name given to those substances in nature or of art which are employed as a medium of exchange and as a measure of value. Gold and silver have been found to possess the most general uniformity of value and convenience in use as measures of exchange, and for this reason the governments of civilized countries have given to these substances the quality of legal tender, i. e., have by law required that they be accepted in payment of debts. The above definition will suffice for practical purposes, but it should be noted that the true meaning of the term money is a matter of dispute, some holding that intrinsic value is a necessary attribute; others, like Francis A. Walker, that "money is that money does," that is to say, whatever performs the money office is money. According to this latter conception, any substance, such as paper, beads, wampum, whether or not having value, is *bona fide* money, if it does the money work.

The discussion of the subject falls naturally under two heads, first the theory and general functions of money, second the history of monetary standards. In regard to the theory and functions of money the first question that presents itself is what determines the value of money. Here again the economists disagree. In recent times the view is commonly held that the value of money, like the value of any other commodity, is fixed by the law of supply and demand. The supply of money means the amount of money work which the circulating medium in a country at a given time is able to perform. The demand for money is the amount of money work which in that community is required to be done. The factors in the money supply are, first, the actual amount of money, second, the rapidity of circulation. The amount of money remaining the same, if the rapidity of circulation be increased, it is obvious that the amount of money work which can be done will be increased. This is summed up in the common saying, "the nimble sixpence does as much work as the slow shilling." On the other hand, a decrease in the rapidity of circulation, the money demand being the same, would make a larger amount of the circulating medium necessary in order to supply the needs of trade. From this it would appear that increasing the amount of money in circulation at any time would tend to lower the value of the monetary unit unless the demand increased commensurately. This is the "quantity" theory of money. In practice this theory has not much value, for it is impossible to determine that factor in the money supply which we call the rapidity of circulation. The mere fact that the amount of money is

increased is not enough to make us certain that the value of the monetary unit will decrease, for the rapidity of circulation may fall off to the same extent as the amount of the circulating medium has increased. Again, there is another uncertain element which tends to destroy any practical value in the quantity theory, and that is the extent to which instruments of credit may be resorted to. Historically it is not true that an increase in the amount of the circulating medium has been followed by a corresponding decrease in the value of the monetary unit. Thus in the United States between the years 1861 and 1865 prices rose 115%, while the volume of money increased only 59%. Again, the volume of money increased 50% between 1879 and 1884 while prices changed but slightly. These and many other instances would indicate that the quantity theory, in so far as it would make prices vary with the amount of the circulating medium, is inapplicable as an explanation of actual phenomena, on account of the uncertainty of the other elements in the money supply, i. e., the rapidity of circulation and the extent to which instruments of credit are used.

The primary function of money is that of a medium of exchange. Without it the primitive system of barter would be the only means of transferring goods. If each would-be purchaser were compelled to find some one who possessed what the former desired and desired what the former possessed, it is evident that an incalculable amount of time would be lost in making exchanges. A man who owned a cow and required a bushel of wheat would find it difficult without the intervention of the medium of exchange to secure the wheat. What is known as the "double coincidence of wants" hinders exchange under the system of barter, for the would-be purchaser must find a man not only having the thing desired and desiring the thing which the first has to offer in exchange, but, further than this, the second man must have the commodity in such a quantity that it will measure to him the exact value of the commodity offered by the first man. Thus the complicated adjustment of desires blocks at every step the exchanging process. Now as soon as the community are agreed upon some common medium of exchange in terms of which the value of all commodities can be estimated, the problem is simplified a thousandfold. But for this medium man would have to consider the relative value of the commodities possessed in comparison with each one of the commodities which he desires to possess. In a primitive stage of society in which a man produced all that he consumed, exchange would be unnecessary. As society advances, however, and the division of labor appears, a man produces only a portion, and perhaps nothing at all, of what he himself needs. The only way, then, in which he can supply his own wants is by exchanging his products for the products of others. With every advance in the industrial arts the principle of the division of labor is carried further and the necessity of exchange is enhanced. The need of a medium of exchange, therefore, arises from the division of labor, and in turn it increases that division of labor by making it possible for men to specialize their employments further, in a certain knowledge that, however limited be the scope of their productive activity and however insufficient for their personal wants be the commodities they produce, they can always obtain through the process of exchange the means of satisfying their needs and desires.

While supply and demand, as defined above, are the immediate determinants of the value of money, in the long run its value tends to conform, like the value of any other commodity, to the cost of production, that is, if the value of money during a long period of time be greater in proportion to its cost of production than the value of the other articles, the production will be stimulated with the result of increasing the supply and lowering the value. On the other hand, if the production of money be carried to a point at which through competition the profits of producers are reduced below the general average of profits in other industries, there will be a tendency for productive forces to be directed into other channels, thus decreasing the supply and raising the value. Yet in the case of the precious metals the cost of production is less effectual in fixing the value than in the production of other commodities. The amount of the precious metals produced is so insignificant compared to the existing stock that a considerable increase or decrease may go on for a term of years without so affecting the supply as to alter the value. In order to alter the value the existing stock must be considerably increased or decreased. Nor is the ratio of value of gold to silver in close proportion to the respective amounts of these two metals produced during a given time. For instance, the amount of gold added to the currency between 1721 and 1740 was 381,600 kilograms; between 1741 and 1760, 492,200 kilograms. During the former interval the amount of silver obtained was 8,624,000 kilograms, and in the latter period 10,663,000. During the former period the ratio of value of gold to silver was 15.1; during the latter it was 14.8. If we consider paper currency as money, we must note that this limitation resulting from the cost of production does not form an element in its value. Paper money can be produced at a nominal cost. Its value is determined exclusively by the law of supply and demand—by the willingness of people to accept it in the payment of debts. Just here is involved the danger of paper issues, for restriction of supply does not depend upon natural causes, but merely upon the will of the issuing government, and the temptation to over-issues appears from history to be too great to be withstood, although there are numerous instances of practically irredeemable paper currency's performing all the functions of money. Another office of money resulting from its use as a medium of exchange is its function as a measure of value. The use of the same commodity as a medium of exchange results in the habit of estimating value exclusively through that medium. This function of money as a measure of value has led to the confusion of the terms money and wealth, for we are so used to estimating wealth in terms of money

that we confound the symbol with the thing symbolized. This error was present especially in the writings of the older school of economists known as the Mercantilists. They seemed in many instances to regard money as synonymous with wealth. Their theories bore fruit during the seventeenth and eighteenth centuries in that mass of legislation which sought by every means to pile up the amount of specie within the national boundaries. It seemed to be their view that bargains between nations could never be mutually advantageous and that the measure of a nation's gain in any transaction was the excess of specie which it secured. For this reason, every effort was made to promote exportation, which resulted in the bringing in of the precious metals, and to discourage importation, which drained a country of its specie. The fallacy of these views was pointed out by Adam Smith toward the close of the eighteenth century and the reaction against the doctrine and policy of the mercantile school is a characteristic of the economic writings in the early part of the nineteenth century. This reaction proceeded too far, for it lost sight of the fact that while this crude misconception of the nature of money and wealth was undoubtedly present in the minds of the Mercantilists, there was nevertheless an element of sound philosophy at the basis of their economic speculations. The expansion of trade and industry was hindered in the seventeenth and eighteenth centuries by the lack of a sufficient amount of the circulating medium. The acquisition of specie was, therefore, a legitimate object of national policy. It was so rapidly absorbed in the increase of trade that it did not result in that inflation which might have been expected. It supplied existing needs, permitted the division of labor to be carried further, and increased economic activity. Yet the attempt to measure a nation's progress by the state of its balance of trade, that is to say by the amount of precious metals which it gains from year to year in its transaction with other nations, is absurd, for the reason that money is not the exclusive form of wealth, nor is it even the main item in the list of a nation's stock of valuable things. See Balance of Trade.

Besides serving as a medium of exchange and a measure of value, money performs the function of a standard of deferred payments. A commodity which might well serve in these other capacities might fail utterly in the qualities requisite in a standard of deferred payments. Thus, a slowly depreciating currency is often accepted in the economic transactions of daily life, and the value of goods is estimated in terms of this currency, but in the case of debts which have a long time to run, we desire certainty that the value of the medium in which these debts are paid will be neither more nor less than its value at the time when the debts were incurred. The study of the value of the precious metals during a long period of years reveals the fact that while they show extraordinary stability from day to day and from year to year their fluctuations during long intervals are greater than the changes in the price of some other commodities, principally of those which supply the most common and pressing economic wants. Thus, the price of a bushel of wheat varies from day to day, but its real purchasing power at one time as compared with its real purchasing power at a time long previous shows but slight change. On the other hand, the purchasing power of the precious metals has greatly altered in the course of fifty years. For this reason some economists favor what is termed the "multiple standard." They take a list of certain articles which supply the daily needs of the community,—for example, the cereals, meat, clothing, etc., and, finding the price of each of these articles according to the current market list, ascertain their total price and divide by the number of articles. The result is the existing money value of a unit representing a certain power of satisfying the needs of the community. In the case of long leases the money value of these obligations would be expressed by a number of these units; at the expiration of the lease or at the maturity of the obligation the same number of units would be expressed in terms of money which would then be paid in discharge of the debt. Thus, instead of receiving the wealth promised in a form liable to change and having no relation to our economic wants, we should receive an equivalent in command over the necessaries of life. This plan has been adopted in some instances, but the objection to it lies in the unwillingness of people to perform complicated mathematical operations and in the habit of using the precious metals as a standard of deferred payments.

The most famous monetary principle is that which is known as "Gresham's Law." This as ordinarily stated is, "Bad money drives out good money." If clipped or mutilated coins are circulated side by side with coins of full weight the latter will find their way into channels closed to the former. In the payment of foreign debts good coin will be accepted and bad refused. In the industrial arts good coin will command a higher price for purposes of melting than bad coin. The bad coin suffices as well as good for purposes of exchange. Accordingly there is a tendency for the good coin to disappear from circulation and the bad to remain. This law would not operate if the demand for the currency as a whole were so great that both good and bad coins would have a greater value in circulation than if employed in the payment of foreign debts or in the industrial arts. Gresham's Law, therefore, applies only in cases where the body of the currency as a whole is somewhat in excess of the money demand, and in consequence tends to diminution through exportation or use in the industrial arts. If this condition is present, it is obvious that in selecting coins for either of those purposes men will choose the good and leave the bad.

Another important monetary law is the law of the equilibrium of prices. By this is meant that if the precious metals are in excess in any one country there will be a tendency for them to flow into some other country where the need for them is greater. If, for instance, the gold and silver in circulation in the United States were increased to such an extent that prices rose, the United States, from the foreigners' point of view, would

be a good country to sell in but a bad country to buy in. Every sale to a foreign country would withdraw a certain amount of the precious metals, thus lowering the supply of the latter at the same time that it increased the relative amount of goods. In this way prices tend to adjust themselves internationally. This is nothing more than to say that money flows into those countries where it will buy the most. At the same time as this country would be a bad country to buy in there would be a tendency for the American merchant to purchase more of his goods elsewhere. The effect of this would be to carry out the precious metals in payment for these goods themselves, increasing the stock of the latter and increasing the amount of goods in the United States. In both these ways, as a result of the automatic action of the market, prices would tend downward until equilibrium was reached. Exactly the reverse of this would happen if prices in one country were below the general level of the prices throughout the world. That country would then be a bad country to sell in but a good one to buy in, and, through the same automatic action of the market, prices would tend upward until the level was reached. This does not mean that the prices of the same article must be the same throughout the world, for of course we must reckon with the cost of transportation and the fact that labor and capital will not flow freely from one country to another to take advantage of the foreign market. All that the law of equilibrium of prices means is that there are certain limits beyond which prices in one country cannot go without attracting foreign purchases or causing foreign sales. If this were not true there would be nothing to prevent the indefinite accumulation of gold and silver within a nation's boundaries and the indefinite increase of prices.

In the history of money, one of the most important questions has been, Who should issue money? In earlier ages money was issued by private individuals, but, as civilization advanced, it became evident that this was a duty incumbent upon the central authority, for the circulating medium should above all things be uniform in value, and its weight and fineness should be readily ascertainable. Accordingly, in all civilized countries, the right of coinage has been assumed by the state. The next question in regard to coinage has not received a uniform answer among civilized nations. This is the question, Who should bear the expense of coinage, and who should realize the profit arising from the change of the metal from a mere commodity into a legal medium of exchange? As a usual thing, the government has charged the expense of coinage to the persons who bring the metal, or in other words, has required that such persons should give up a part of the metal in return for the service which the government renders in cutting and stamping the coin. Generally the government also realizes the profit arising from coinage. The amount charged for the mere expense of coining is termed *brassage*. A deduction in excess of the cost of coining is termed *seigniorage*. In England, the only expense borne by a person who brings money to the mint for coinage is the delay involved in the operation. This policy, which is known as "gratuitous" coinage, has been adopted in order to encourage the coining of the precious metals. It is defended on the grounds, first, that the coins produced are used by the nation, and that therefore the expense of the coinage ought reasonably to be paid out of the nation's revenue; second, that the expense of the mint is small compared to the amount of coin issued; third, that the face value being the same as the value by weight, an excess of the coins thus issued is readily carried off in foreign trade. On the other hand, the deduction of the cost of the coinage is defended on the ground that it prevents the continual melting or exportation of the coin in response to variations between the market value and the legal value of the coin. As to seigniorage, i. e., deduction in excess of the cost of coinage, it has been resorted to from various motives; sometimes merely for the purpose of securing a profit to the issuer; sometimes in order to prevent token money or fractional currency from leaving the country, or from being melted down in the industrial arts. According to Ricardo's theory, a difference between the face value and the bullion, or commercial value of coins, would not affect their value in circulation, provided that their number was not increased. That is to say, if a government should issue the same number of monetary units as it had previously issued, the withdrawal of a certain amount of metal from each of these coins would not of itself depreciate their value, since that value is determined by the law of supply and demand, and since the supply of the coins is unchanged. According to this theory, it is only when a government coins a larger number of pieces that the danger of depreciation can ensue. On this principle, we might regard paper as equivalent to coin from which a seigniorage of 100 per cent. was extracted, and hold that if the supply of this paper money remained the same there would be no danger of depreciation. An important qualification of this theory is that the coin or paper money should not be of such a character as would engender distrust among exchangers. If, for any reason, people are unwilling to accept this currency, depreciation will follow. The Ricardian law, then, is true only on the condition that the difference between the bullion value and the face value in the monetary medium has no tendency to arouse distrust. The history of monetary standards cannot be treated in detail within the limits of the present article, and discussion will be confined to the monetary history of the United States.

The first American money that history informs us of was wampum and the dried codfish of Newfoundland. The latter were in general use as money, and answered the purpose better than any other material that could have been procured in that region. A single fish was a sufficiently small change for small transactions, and a mass of them not too cumbersome for the purchase of anything a barbarian would be likely to want. Only acquired by labor, easily preserved and transported, at all times useful to tribes away from the sea-shore, and exchangeable for what they had which the sea-shore

Indians had not, its superior convenience to any other one commodity made its adoption for money natural. On the Atlantic coast south of Massachusetts another form of money of a higher type was found among the Indians. This consisted of small shells strung like beads. They were of two kinds, white and black. The white was the periwinkle; the black was made with more labor out of the black part of a clam-shell, and was double the value of the white. Strings, groups of strings, and belts made of them were the money known as wampum. Not common enough to be found *ad libitum* and therefore representing labor in the acquisition; having the value of prettiness, lightness, divisibility by count, by strings, by belts,—this wampum was one of the most complete money measures known among barbarous nations. In the early days of the colonies, when coin money was scarce, wampum was adopted and used to great advantage in trading not only with the Indians, but among the colonists themselves. It will be seen that the sea-shore Indians had the advantage of the interior Indians in the manufacture of this money, and could buy furs, corn, and feathers probably with less labor in procuring wampum than the latter had in procuring these articles. Wampum was made a legal tender in the Massachusetts colony for 12d. only. A belt of it was 6 ft. long, and consisted of 360 beads. A white belt in Massachusetts in the early time of its settlement was the equivalent of 5s. worth of furs, and a black belt of 10s. worth. Three beads of the black and six of the white were equal to one penny. The value of this money was, after a time, seriously deranged by "an inflation" caused by the importation of beads. The Indians, seeing their superior beauty and ignorant of the illimitable quantity of them, made exchanges to great disadvantage with the whites, who imported the beads by the barrel.

In 1641, in the Plymouth colony, corn was made a legal tender for the payment of debts, "to save the debtor from the inequity of forcing him to great sacrifices in consequence of the scarcity of the money of the realm." About 1650 the exports of Massachusetts were bringing in returns of gold and silver Spanish coins. In 1652 a mint was set up in Boston to make a set of coins for home circulation, and the colonists made laws to impede the circulation of Spanish coins in order to drive them to the mint; thus recognizing, what every nation sooner or later learns, that for domestic exchanges a non-exportable currency is desirable. For some time later the lack of any sufficient recognized money in the New England colonies caused the tax collectors to be authorized to receive corn, cattle, furs, and lumber for taxes, and the local authorities were obliged to furnish accommodation for these commodities; but "lank cattle" were refused. In 1655 wampum was still received for taxes at the rate of six shells to the penny, and the limitation to 12d. as legal tender does not seem to have applied to taxes. In 1675 it was ordered by the Massachusetts colonial council that "instead of transporting barter payments of taxes to and from the treasury, the transfers should be made by paper orders." In 1686 a bank of issue sprang into existence and soon went out. The mint was discontinued in 1688. In 1690 the colony issued notes for about one-seventh of the debt contracted by a disastrous expedition against the French in Canada, and made them receivable for taxes and for goods paid into the treasury for taxes. In 1692 a premium of 5 per cent over coin was allowed at the colonial treasury for these bills, and they remained at par for 20 years.

In Connecticut about this time different kinds of money were scaled in payments. Plain "pay" was barter at the government rates. "Money" was Spanish or New England coin and wampum for change; 12d. "pay" equaled 6*d*. "money." After 1700 Massachusetts issued paper money to a moderate extent. It was received for taxes and held at par with coin. In 1709 to 1711 Massachusetts, New Hampshire, Rhode Island, Connecticut, New York, and New Jersey joined in an expedition against Canada. The first colony increased its paper money moderately, and Rhode Island immoderately, and lengthened the term for its payment. The arts of banking were at this time engaging the attention of schemers the world over. John Coleman in Boston proposed a plan to issue notes on land security. The council did not permit him, but did itself in 1715 "bank," that is, issue, £30,000 of notes payable in coin in 10 years. The time of payment was deferred as the term approached. In 1721 another "bank" of money was issued, drawing interest to the government, payable in hemp or flax.

In 1723 Pennsylvania authorized the issue of colonial paper money to the amount of £15,000, to be apportioned among its counties according to the amount of their taxable property, and to be loaned by the county commissioners for 16 years at 5 per cent interest, and one-sixteenth of the principal, annually. Notes paid back during the first ten years were to be loaned again for the remainder of the period. In 1729, when Benjamin Franklin commenced the publication of his first newspaper, the question of an additional issue was being discussed. About 40 years afterwards Franklin, in his autobiography, thus alludes to the subject: "About this time there was a cry among the people for more paper money; only £15,000 being extant in the province, and that soon to be sunk. The wealthy inhabitants opposed any addition, being against all paper currency, from the apprehension that it would depreciate, as it had done in New England, to the injury of all creditors. We had discussed this point in our junta, where I was on the side of an addition; being persuaded that the first small sum struck in 1723 had done much good by increasing the trade, employment, and number of inhabitants in the province; since I now saw all the old houses inhabited, and many new ones building;

whereas I remembered well, when I first walked about the streets of Philadelphia, eating my roll, I saw many of the houses in Walnut street between Second and Front streets, with bills on their doors 'to be let,' which made me think the inhabitants of the city were one after another deserting it. Our debates possessed me so full of the subject that I wrote and printed an anonymous pamphlet entitled *The Nature and Necessity of a Paper Currency*. The utility of this currency became by time and experience so evident, that the principles upon which it was founded were never afterwards much disputed; so that it grew soon to £55,000; and in 1739 to £80,000; trade, building, and inhabitants all the while increasing. Though I now think there are limits beyond which the quantity may be hurtful" (Sparks' *Franklin*, vol. i., pp. 90–92).

About 1720 the commissioners of the New England colonies became alarmed at the tendency to further increase of paper notes for money, and recommended its stop. The English parliament forbade banking except under its charter, and forbade the colonial governments from emitting bills. Later the restriction was modified to permit an issue for government expenses only. In 1739 a "land bank" was set in operation in Philadelphia, which loaned its notes for 3 per cent per annum interest, and 5 per cent in principal, *both payable in merchandise*. This is one of the first American examples of the fertile banking which secures a payment of merchandise for the loan of a debt. This bank became a strong factor in politics, and as fortunes were to be made through it by the managers without any capital risked by them, they could afford to agitate energetically. "The land bank," says Sumner, "resisted its fate by social and political intrigues." In 1740 parliament required its wind up, but it managed to evade the requirement. The history of the shifts made use of to take up, to pay, and to re-issue paper money in Massachusetts and the other New England colonies for the next 30 years, is simply the example of how legislation, controlled first by men with one interest, and then by men of another interest, without any philosophic, disinterested statesmanship to harmonize conflicting interests, can keep up a financial agitation injurious to all parties. The history of the colonial paper money issues of Pennsylvania, on the other hand, which started on a more sound and philosophic basis, is much more satisfactory; and although in the end the original chart was lost sight of, the benefits far outweighed the injury resulting from their excesses.

At the beginning of the revolution the Continental congress issued its note money in addition to that which the colonies separately had already issued, and were continuing to issue under different laws and with various degrees of prudence. The first joint or "continental" issue was in Aug., 1775, for 300,000 Spanish dollars, payable in three years. Other issues followed rapidly. These notes generally passed at par with gold and silver until the latter part of 1776, when their amount reached $20,064,000. The following table condensed from Gouge's *History of Continental Money*, gives the issues and depreciation:

Amount issued up to, and inclusive of the year—

	1776	$20,064,464	Rate of exchange for gold or silver	Jan. 1, 1777	1¼	for 1
Added in	1777	26,426,333	" "	" 1778	4	"
"	1778	66,965,269	" "	" 1779	9	"
"	1779	149,703,856	" "	" 1780	45	"
"	1780	82,908,320	" "	" 1781	100	"
"	1781	11,408,095	" "	" 1782	500	"
Total		$357,476,541				

The French alliance in 1779 enabled congress to borrow money, and it attempted to limit the outstanding issues of paper money to $200,000,000, but did not. The loss of value of the entire issue became complete in 1781, and having been gradual as it passed from hand to hand through several years came to be regarded in the light of an involuntary tax for the maintenance of the war, which in general had fallen severely on people according to their means, though in cases it produced shameful wrongs. But, says Phillips, "if it saved the state it also polluted the equity of our laws."

In Jan., 1782, the Bank of North America, chartered with a capital of $400,000, opened in Philadelphia. It was a private bank, having the confidence and support of the Continental congress. $70,000 in specie were put into its capital by citizens, and the remainder by the government in specie or foreign exchange out of a foreign loan. The bank had its origin in a union of Philadelphia citizens to supply the army. They issued the bank's notes in pay for them. Gouge, in his *History of Paper Money and Banking in the U. S.*, published in 1833, shows that it was a mistake to suppose that that bank aided the government; as its stockholders only paid in $70,000, or seven-fortieths of its capital. The government deposited $254,000, and was credited by Robert Morris with that amount of stock in the bank. The individual directors thus acquired the power to circulate $400,000 in the bank's notes, and loaned the government and others their own money and the $400,000 additional money which the government's deposits and sanction soon made current at par. The dividends were soon from 12 to 16 per cent for the stockholders, with fat livings for the organizers. "In 1785," says Gouge, "the effects of its operation began to be apparent. A temporary plentifulness of money, followed

by great scarcity, usury, ruin to the many, riches to the few." In 1785 the Pennsylvania legislature repealed the bank's charter, but it continued operations by virtue of the congressional charter, and managed to get a renewal afterwards from the state by means of its great monetary influence. From the beginning of 1780 till the close of the war hard money is said to have been plenty; caused by considerable sums disbursed by the French and British armies, by the loan made to the government, and by commerce with the West Indies. France spent $3,000,000 in specie to meet her army and navy expenses, besides what came through her as loans. Such was the flux of specie to America then that in both France and England the drain was seriously felt.

In 1787 the clause in the new federal constitution that no state "shall coin money, emit bills of credit, or make anything but gold or silver coin a tender in payment of debts" would seem to have forever barred a state, not only from issuing bills of credit, but from giving charters to banks of issue; as it seems absurd that a state legislature may delegate a power to private corporations which the constitution has denied to the state itself. But the profits of the Bank of North America in Philadelphia had stimulated banking; Massachusetts, New York, and Maryland gave charters to banks which the U. S. courts did not abrogate. The system of state banks thus begun did not terminate till congress wrestled with the subject and suppressed them during the great rebellion. In 1791 congress chartered the first U. S. bank. See Bank—Banking; Jackson, Andrew; United States. About 60 state bank charters were issued prior to 1800. Their subsequent increase and separate history in each state is without the pale of this article.

Gold and Silver Coinage in the U. S.—The act of April 2, 1792, establishing a mint, provided that the silver dollar should contain 371¼ grains of pure silver and fixed the weight of a gold dollar at $24\frac{75}{100}$ grains, thus adopting the ratio of 15 to 1. This was very close to the true market ratio between the two metals at that time, but gold soon began to grow scarce, and by 1817 had wholly disappeared from circulation. Thus the adoption of the double standard was of no avail in keeping the metals at par. It became necessary to change the legal ratio to correspond to the actual market ratio, and during many sessions of congress various projects to this end were discussed. In 1834 the "Gold Bill" was passed, providing that the legal ratio should be 1 to 15.988, although the market ratio was only 1 to 15.625. This overvalued gold, just as the previous act had overvalued silver, and as a consequence silver went to a premium and disappeared from circulation in order to pay foreign debts. It is evident that although this act retained the double standard in theory, it made the U. S. a gold standard country in practice. Silver did not disappear from circulation as completely as gold on account of its indispensableness as small change and the greater expense of shipment. Still even the subsidiary silver coins began to leave the country after a time, and congress was obliged to reduce their weight (1853) and to limit the amount receivable as legal tender to five dollars. During the next twenty years silver continued at a premium and only five and a half millions were coined. In 1873 a silver dollar was worth $1.02 in gold, and so far as domestic circulation was concerned, the coin was obsolete. It was at this time that the famous act of 1873 was passed demonetizing silver. As the advocates of the free coinage of silver have claimed that this act was passed surreptitiously, it is important to notice that the bill was printed thirteen times, and that the discussion and the proceedings on it take up 144 columns of the *Congressional Record*. Another point brought up by the free silver party in support of the view that there was an intention to deceive the people as to the true nature of the measure, is the fact that the act nowhere expressly demonetizes the standard silver dollar, but merely drops it from the list of legal tender coins. In regard to this it should be noted that the fact that silver was demonetized was clearly brought out in the previous discussion, and that the bill in its original form stated that all silver coins, whether subsidiary or otherwise, should be legal tender only to the amount of five dollars, while another section provided that the gold dollar should be the unit of value. The fact is, this criticism of the act of 1873 was due wholly to subsequent events, for silver, being at a premium at the time, was in no sense the unit of value, nor was the debtor class in any way defrauded, because no one would choose to pay his debts in the more expensive coin.

Silver dollars containing 384 grains could be coined under this act, but for this dollar was afterward substituted the so-called trade dollar of 420 grains, which was intended as a convenient form for exportation, but was allowed to circulate as legal tender for amounts under five dollars. Since this dollar was at first worth more as bullion than as currency, it was not likely to circulate extensively as coin, but when the price of silver fell so far that the market value was less than a dollar, it began to circulate rapidly in retail trade. In 1876 congress deprived it of its legal tender quality.

The legislation in congress to complete the demonetization of silver was closed by these words in section 3,586 of the revised statutes: "The silver coins of the United States shall be a legal tender at their nominal value for any amount not exceeding five dollars in any one payment." The following is a copy of the provisions of the revised statutes down to Mar. 4, 1875, concerning all forms of legal tender money then recognized:—

"Sec. 3,584. No foreign gold or silver coins shall be a legal tender in payment of debts.

"Sec. 3,585. The gold coins of the United States shall be a legal tender at their nominal value when not below the standard weight and limit of tolerance provided by law for the single piece, and, when reduced in weight below such standard and tolerance, shall be a legal tender at valuation in proportion to their actual weight.

"Sec. 3,586. The silver coins of the United States shall be a legal tender at their nominal value for any amount not exceeding five dollars in any one payment.

"Sec. 3,587. The minor coins of the United States shall be a legal tender at their nominal value for any amount not exceeding 25 cents in any one payment.

"Sec. 3,588. United States notes shall be lawful money, and a legal tender in payment of all debts, public and private, within the United States except for duties on imports and interest on the public debt.

"Sec. 3,589. Demand treasury notes authorized by the act of July 17, 1861, chap. 5, and the act of Feb. 12, 1862, chap. 20, shall be lawful money and a legal tender in like manner as U. S. notes.

"Sec. 3,590. Treasury notes issued under the authority of the acts of Mar. 3, 1863, chap. 73, and June 30, 1864, chap. 172, shall be legal tender to the same extent as U.S. notes, for their face value, excluding interest: *Provided*, That treasury notes issued under the act last named shall not be a legal tender in payment or redemption of any notes issued by any bank, banking association, or banker, calculated or intended to circulate as money."

In the next few years silver rapidly depreciated. Attributing this solely to the demonetization act of 1873, the 45th congress determined to restore the silver dollar, and in 1876 entered upon an animated discussion of the subject. The house passed a bill introduced by Mr. Bland, providing for the coinage of silver on the same terms as gold at the ratio of 16 to 1, the existing market ratio being at that time 18 to 1. In the senate the bill was passed, but with an amendment offered by Mr. Allison, providing that the government should buy not more than 4,000,000 or less than 2,000,000 dollars worth of silver bullion each month, and that the silver dollars coined from this bullion should be full legal tender money. This measure known as the Bland-Allison, or more properly the Allison bill, was passed over the President's veto and became a law Feb. 28, 1878. Sec. 1. provides for the coinage of the original silver dollar of the same weight, fineness, devices, and superscriptions, required by the act of 1837; that it, and all previously coined silver dollars of the United States shall be a legal tender at their nominal value, for all debts and dues public and private except where otherwise expressly stipulated in the contract; that the secretary of the treasury is authorized and directed to purchase, from time to time, silver bullion, at the market price thereof, not less than $2,000,000 or more than $4,000,000 worth per month, and cause the same to be coined monthly, as fast as so purchased, into such dollars, "provided that the amount of money at any one time invested in such silver bullion, exclusive of such resulting coin, shall not exceed $5,000,000; and provided further, that nothing in the act shall be construed to authorize the payment in silver of certificates of deposit issued under the provisions of sec. 254, of the revised statutes." Sec. 2. provides that the president after the passage of the act shall invite the countries composing the Latin Union, so called, and other European governments to join the United States in a conference "to adopt a common ratio between gold and silver, for the purpose of establishing internationally the use of bimetallic money," to which conference he should appoint three commissioners. See Monetary Conferences, International. Sec. 3 provides that "any holder of the coin authorized by this act may deposit the same with the treasurer or any assistant treasurer of the United States, in sums not less than ten dollars, and receive therefor certificates of not less than ten dollars each, corresponding with the denominations of the U. S. notes. The coin deposited for, or representing, the certificates shall be retained in the treasury for the payment of the same on demand. Said certificates shall be receivable for customs, taxes, and all public dues, and, when so received, may be reissued."

The Allison act was a necessary concession to those who demanded the free coinage of silver, and for a time it seemed to satisfy them. Under its provisions there were coined over 378,000,000 silver dollars, of which about 57,000,000 went into circulation. For the remainder, silver certificates were issued in accordance with a provision of the law authorizing the holder of silver dollars to deposit them in the Treasury and receive certificates therefor. The silver agitation, however, continued, and in 1890, the house having refused to concur in a free coinage bill passed by the senate, congress adopted another compromise measure, known as the Sherman Act, which authorized "the Secretary of the Treasury to purchase, from time to time, silver bullion to the aggregate amount of 4,500,000 ounces, or so much thereof as may be offered in each month, at the market price thereof, not exceeding $1 for 371.25 grains of pure silver, and to issue in payment for such purchases of silver bullion Treasury notes in such form and of such denominations, not less than $1 nor more than $1,000, as he may prescribe, and a sum sufficient to carry into effect the provisions of this act is hereby appropriated out of any money in the Treasury not otherwise appropriated." These treasury notes are to be redeemed in coin on demand, but the act declares that it is "the established policy of the United States to maintain the two metals on a parity with each other upon the present legal ratio, or such ratio as may be provided by law," so while it is left to the discretion of the secretary to redeem them in either gold or silver, he has been actually obliged to redeem them in gold in order to keep the two metals at par. There was no further legis-

lation affecting the monetary standard till 1893, when people began to fear that the reserve of $100,000,000 in gold which was intended for the redemption of greenbacks, would be invaded on account of the heavy exportation of gold. This fear proved to be well grounded, for in the spring of that year the statement showed for the first time since 1878 a reserve of less than $100,000,000 in gold. Then came the news that the government of India had demonetized silver. It was now feared that the U. S. would be reduced to a silver basis. Under the pressure of public opinion an extra session of congress was called in August, 1893, and after some delay, a bill was passed repealing the silver purchase clause of the Sherman Act. This, however, neither averted the panic, nor checked the silver agitation, which finally forced the question on the attention of the entire country, and made the election of 1896 turn wholly on the coinage of silver at the ratio of 16 to 1. The election of McKinley on a gold platform did not at once suffice to restore the confidence which had been shaken by the long period of uncertainty in respect to the circulating medium.

The different kinds of legal tender money in circulation in the United States were, in 1897, (1) gold coin, legal tender without express limit; (2) silver dollars and treasury notes, legal tender except where otherwise expressly stipulated in the contract; (3) U. S. notes, i. e. greenbacks, legal tender except for interest on the public debt; (4) national bank notes, receivable for debts to any national bank and for all government dues except duties on imports, and for all government debts except interest on bonds; (5) subsidiary silver coins, i. e. smaller than one dollar, legal tender to the amount of ten dollars in one payment; (6) nickel and copper subsidiary coins, legal tender to the amount of twenty-five cents in one payment. Few countries can show such heterogeneous currency as this. The feeling that the system, or lack of system, in currency matters in the United States needed radical improvement has created a party of currency reform, whose attitude is based on the following considerations. So long as the government is in the banking business and is obliged to issue notes in order to meet the exigencies of the money demand, it is thought that there will always be a feeling of uncertainty in regard to the ability or willingness to effect prompt remittance. The party of reform holds that the issue of notes is properly a banking function. The bank has special facilities for knowing the needs of the community. Its notes are drawn out by depositors in the natural course of business. On the other hand the government has no means of adjusting the supply of money to the demand. Moreover, while the bank can be coerced into remittance, the force behind the government in respect to this matter is merely public opinion, which at different times takes a different view of the national honor. The national banks, owing to the too stringent rules governing their circulation, have not supplied a flexible currency, or one that increases with the increasing demands of trade. Only a small portion of the representative money of the United States consists of bank notes. The great bulk of it consists of silver certificates, silver dollars, treasury notes and greenbacks. The government is required to redeem the treasury notes and greenbacks in gold and maintains a gold reserve for this purpose. The advocates of currency reform point to the danger of a depletion of this reserve, as illustrated in the panic of 1893–4. They advocate as a remedy the granting of more liberal privileges to the national banks, and the retirement of the greenbacks by the government. This view has encountered opposition from several quarters and for various reasons. There is a conservative element which is steadfastly opposed to any further enlargement of the powers of the national banks. On the other hand there is a class favorable to the furtherance of the note-issuing policy of the government. Its adversaries range all the way from the advocates of an unrestricted issue of fiat money on the part of the government, to the conservatives who see a danger in the extension of the banking principles. In the summer of 1896 the money which the treasury of the United States was keeping in circulation and maintaining at a parity with gold consisted of $346,681,016 of greenbacks, $128,343,280 of treasury notes, 431,852,041 standard silver dollars, or silver certificates, and $75,667,706 in subsidiary silver coins. The total amount in circulation was $982,544,043. The national bank notes amounted to $226,030,042.

Persons desirous of studying money questions will find the most complete list of works to choose from in the appendix to vol. 5. of the executive documents of the 3d session of the 45th congress, being the report of the commission appointed to represent the United States in the monetary conference in Paris in 1878. The books and pamphlets are there arranged in chronological order down to the beginning of 1879. A large part of the most valuable literature on the subject is in the form of pamphlets. Among the most instructive of recent books the following is a selected list of those in the English language: *Money and Trade*, 1879, by Prof. Francis A. Walker of N. Y.; John Sherman's *Speeches and Reports on Financial Questions*, 1 vol., 1879; *Silver and Gold*, 1876, and *The Monetary Situation*, 1878, both by S. Dana Horton of Cincinnati; *Gold and Debt*, W. L. Fawcett, Chicago, 1877; *The Money Question*, by W. A. Berkey, Grand Rapids, Mich., 1876; Senate document, *Report of the Monetary joint committee of Congress in* 1877; *Report of the Paris Monetary Commission of* 1878, just mentioned. These government reports are compendiums of facts and opinions of great value. Sumner's *History of American Currency* is a racy sketch, but crude in its reflections. *Money and the Mechanism of Exchange*, by W. S. Jevons of London, is one of the high authorities on money in connection with banking. The most valuable old work on "Paper-money and Banking in the United States" is that of Wm. M. Gouge, Philadelphia, 1833. Kellogg's *New Monetary System*, 1837, is a remarkable elaboration of speculative philosophy concerning money. *The Ways and Means of Payment*, by Stephen Colwell, Philadelphia, 1859, is an analytic treatment of money and credit of high value. See also J. B. Clark, *The Philosophy of Wealth* (1887); A. Del Mar, *History of Monetary*

Systems (1895); C. F. Dunbar, *Laws of the United States Relating to Currency, Finance and Banking* (1891); G. J. Goschen, *The Theory of Foreign Exchanges* (1883); J. L. Laughlin, *History of Bimetallism in the United States* (1886); J. S. Nicholson, *Money and Monetary Problems* (3d ed. 1895); Horace White, *Money and Banking* (1896). Among periodicals containing valuable articles on monetary matters are the *Annals of the American Academy of Political and Social Science* (Phila.); *The Economic Journal* (London); *The Journal of Political Economy* (Chicago); *The Political Science Quarterly* (New York); the publications of the American Economic Association (Baltimore and New York) and the *Quarterly Journal of Economics*.

MONGE, GASPARD, Comte de Péluse, a French mathematician and physicist, was b. of humble parentage at Beaune, in the department of Côte d'Or, May 10, 1746. When only fifteen, he went to study natural philosophy at the oratorian college of Lyons, and afterwards obtained admission into the famous artillery school at Mézières, where he invented the method known as "descriptive geometry," which was at first received with incredulity, but afterwards with avidity, and, for a time, jealously kept secret by the military authorities. In 1772 Monge became tutor and professor at Mézières; in 1780 he was chosen a member of the French academy; and three years later was called to Paris as professor of hydrodynamics at the Louvre. As a lecturer, he was precise, clear, and brief; his style was a model of scientific rigor, if not of literary elegance. During the heat of the revolution, he became minister of marine, but after a few months resigned the office. He did not, however, retire into obscurity, but took charge of the great manufactories improvised for supplying the million of soldiers whom republican France had lanched against her enemies, with arms and gunpowder. At this critical period, he showed himself possessed of a genius equal to the occasion. He was everywhere, animating, ordering, counseling, and directing the patriotic artisans. Yet it is characteristic of the insane fanaticism that, for a time, got the upper hand in France, that Monge himself only escaped the guillotine on account of his services being absolutely indispensable. After he had founded the *école polytechnique*, he was sent by the directory to Italy, and intrusted with the transport of the artistic spoils of the republican armies. Here he formed a close friendship with Bonaparte, whom he followed to Egypt. He now undertook the management of the Egyptian institute. During the expedition to Syria, he performed the greatest services to the government established at Alexandria. On his return to France, he resumed his functions as professor in the ecole polytechnique, and, though his reverence for Napoleon continued unabated, he hotly opposed his aristocratic and dynastic views. The title of comte de Péluse (Pelusium) was conferred on him by Napoleon, in memory of the Egyptian expedition. He died July 28, 1818. Monge's principal works are: *Traité Elémentaire de Statique* (7th edit. Paris, 1834); *Leçons de Géométrie Descriptive* (6th edit. Paris, 1837); and *Application de l'Analyse à la Géométrie des Surfaces du* 1 *et du* 2 *Dégré* (4th edit. Paris, 1809). See Dupin's *Essai Historique sur les Services et les Travaux Scientifiques de Monge* (Paris, 1819).

MONGOLIA (see MONGOLS), "the country of the Mongols," comprises a vast extent of territory in the interior of Asia, and forms a part of the Chinese empire. It extends over an area of 1,300,000 sq. m., between lat. 37° and 53° n., and 88° and 126° e. long., and is bounded on the n. by Siberia, e. by Mantchooria, s. by China proper, and w. by e. Turkestan and Dzungari; pop. estimated at 2,000,000. It is more than 1700 m. in length; its width from n. to s. varying between 600 and 1000 miles. For the most part it is a high table-land, 3,000 ft. above the level of the sea, arid, without running water, and without important vegetation. The central portion is the great desert of Gobi, extending s.w. and n.e. from the boundary-line of the province of Kansu to the Dalai Nor, near the boundary of Dauria, having an average width of 200 miles. This is the worst part of the country, the surface being covered with sand and stones, and the vegetation scanty and occasional. Vast tracts are level; but, at great distances from each other, there are hills of moderate elevation. The entire region is destitute of trees, and the water, which is only found at some distance below the surface, is brackish. South-east of the Gobi extends a more elevated and uneven country, terminating in a mountain range of considerable height. This range, the Alashan or Ho-lang Shan, begins near the most southern point of Mongolia, near the banks of the river Hoang-ho, and extends northward along that river nearly 400 miles. Near 42° n. lat. it turns abruptly to the e., forming nearly a right angle, and continues in this direction about 600 m., being now under the name of Inshan. It finally proceeds in a n.e. direction from 42° to 55°. Its highest point has an elevation of more than 15,000 ft. above the sea. The country skirting this range is unfit for agriculture, and is only used as pasture-ground. South of the Inshan mountains there are fertile valleys and mountains partly wooded. To the e., and extending to the Yellow sea, is a narrow tract of fertile land. And southward, again, the country contains numerous meadows clothed with rich grass, where agriculture has been introduced by the Chinese, who send thither criminals who have been condemned to transportation. The most southern district is the haunt of wild animals, including tigers and leopards, and is the hunting-ground of the Chinese. It contains the palace of Ichol, which was described by sir George Staunton. The country which extends along the n.w. side of the desert of Gobi is little known, with the exception of the e. part, which is traversed by the caravan road from Kiachta in Siberia to Khalgan in China. Here the surface of the country is frequently broken by hills and isolated ridges; but the intervening level tracts contain rich pasture-ground. It is mostly well watered, but wood is scarce. Here originate the principal rivers of

Mongolia. This country is rich compared with the other parts of Mongolia. The western part of Mongolia is traversed by a mountain range, which, near its w. extremity, is connected with the Altai mountains not far from the e. bank of the Irtish. That portion of the country which lies s. of this range seems to partake largely of the nature of the Gobi, extending mostly in sterile plains. The Irtish is the largest river in this country, and runs about 160 m. before it falls into lake Zaizan. The climate of the whole of Mongolia is generally cold, though it is subject to sudden changes, and in summer is insupportably hot. The snow-fall, however, is very light. The wealth of the Mongols consists in their numerous herds of cattle (on the more hilly tracts), camels, horses, and sheep. Wild animals are numerous, including hares, antelopes, wild asses, foxes, deer, sables, squirrels, and marmots. Water-fowl are plentiful in the lakes which abound in the n.w. part. The wolves are numerous and savage, attacking even the shepherds in preference to the sheep: there are also the brown and black bear, the yak, and the ounce. The double-humped or Bactrian camel is domesticated for its milk. It is remarked that in the southern portion, where the Chinese practice agriculture, the temperature has risen with the progress of cultivation of the soil, and that grain is now grown there, and ripens readily, which could not formerly be cultivated on account of the cold. The Mongols are generally nomadic, and live in tents. They have sometimes been curiously confounded with the Tartars, and Mongolia is called Tartary on many old maps. No two nations could physically be more distinct, though both are addicted to the same nomadic mode of life. The Tartars belong to the Turki race, from whom the European Turks are descended.

MONGOLS, the name of a numerous and widely spread branch of the human family—the second in the classification of Blumenbach, and corresponding in almost every respect with the branch designated as Turanian by more recent ethnologists. See TURANIAN. Under the designation of Mongols are included not only the Mongols proper, but the Chinese and Indo-Chinese, Thibetans, Tartars of all kinds, Burmese, Siamese, Japanese, Esquimaux, Samoieds, Finns, Lapps, Turks, and even Magyars. Collectively, they are the great nomadic people of the earth, as distinguished from the Aryans, Semites, and Hamites; and are the same who, in remote antiquity, founded what is called the "Median empire" in lower Chaldea, an empire, according to Rawlinson, that flourished and fell between about 2458 and 2234 B.C.; that is, before Nineveh became known as a great city. Thus early did some of these nomadic tribes, forsaking their original pastoral habits, assume the character of a nation. Another great offshoot from this stock founded an empire in China, the earliest date of which it is impossible to trace, but which certainly had reached a state of high civilization at least 2000 years B.C. In early Greek history they figure as Scythians, and in late Roman, as Huns, carrying terror and desolation over the civilized world. In the middle ages they appear as Mongols, Tartars, and Turks. In the beginning of the 13th c., Genghis-Khan (q.v.), originally the chief of a small Mongol horde, conquered almost the whole of central and eastern Asia. His sons and grandsons were equally successful, and in 1240–41, the Mongol empire extended from the sea-board of China to the frontiers of Germany and Poland, including Russia and Hungaria, and the whole of Asia, with the exception of Asia Minor, Arabia, India, and the Indo-Chinese states, and northern Siberia. This vast empire soon broke up into a number of independent kingdoms, from one of which, Turkistan, arose another tide of Mongol invasion under the guidance of Timour or Tamerlane, who, in the latter part of the 14th c., reduced Turkistan, Persia, Hindustan, Asia Minor, and Georgia under his sway, and broke, for a time, the Turkish power. On the death of his son Shah Rokh, the Mongol empire was subdivided, and finally absorbed by the Persians and Usbeks, but an offshoot of Timour's family founded, in the 16th c., the great Mogul empire of Delhi. After the decline of Timour's empire the Turkish branch maintained the glory of the race, and spread terror to the very heart of western Europe. In the 9th c. the Magyars, a tribe of Ugrians, also of Mongol extraction, under their leader Arpad, established themselves in Hungary, where, in process of time, they became converted to Christianity, and founded a kingdom famous in European history. See TURKS and HUNGARY.

The physical characteristics of the Mongols in their primitive state are thus described by Dr. Latham in his *Descriptive Ethnology:* "The face of the Mongolian is broad and flat. This is because the cheek-bones stand out laterally, and the nasal bones are depressed. The cheek-bones stand out *laterally.* They are not merely projecting, for this they might be without giving much breadth to the face, inasmuch as they might stand forward. . . . . The distance between the eyes is great, the eyes themselves being oblique, and their carunculæ being concealed. The eyebrows form a low and imperfect arch, black and scanty. The iris is dark, the cornea yellow. The complexion is tawny, the stature low. The ears are large, standing out from the head; the lips thick and fleshy rather than thin, the teeth somewhat oblique in their insertion, the forehead low and flat, and the hair lank and thin." Of course, such a description as this cannot be understood as applying to the more civilized nations of Mongol origin, such as the Turks and Magyars, especially the latter, who in physical appearance differ but little, if at all, from other European nations. See works on the M. by Howorth and Gilmour.

In religion, the Mongols are, for the most part, Buddhists. There are among them, however, according to the different countries in which they reside, various other religions, as Confucianism, Taouism, fire-worship, paganism of different kinds, Mohammedanism, and Christianity. The Mongol languages, which are very numerous, are described

by Dr Latham as being "aptotic and agglutinate, rarely with true amalgamate inflection." In 1859, according to an estimate formed by prof. Dieterici, the Mongols of all kinds amounted in number to as many as 528,000,000, or about half of the human race.

MONGOUS. See ICHNEUMON.

MONHEGAN ISLAND, off the coast of Lincoln co., Maine. Pop. '90, 90. The first account of it is by Capt. John Smith. It has a stone light-house.

MONIMIA'CEÆ, a natural order of exogenous plants, consisting of trees and shrubs, with opposite leaves destitute of stipules; the bark and leaves having an aromatic fragrance. The flowers are unisexual. The perianth is somewhat globose, divided at the border sometimes into more rows than one. The stamens are numerous, and arise from and cover the whole interior of the tube of the perianth. There are several ovaries, each with one ovule. The fruit consists of several achænia, inclosed within the enlarged calyx. There are about 40 known species, natives chiefly of South America. A few are found in New Zealand and Australia. The fruit of the BOLDU (*boldoa fragrans*), a shrub or small tree, a native of Chili, is eaten. It is a little drupe, about the size of a currant, extremely fragrant when dried.

MONITA SECRETA SOCIETATIS JESU, secret instructions for the Jesuitic order, in a volume first published at Cracow, 1612, in Latin from the Spanish, by an unknown editor. It was then and afterwards regarded by scholars as the work of Claude Acquaviva, the general of the order, exercising over it complete control, and esteemed the ablest and most profound politician of his time. He did nothing to prove the book a forgery, and, so far as known, did not deny that he was the author. It continued unmolested until his death. In 1615 a commission was appointed to search out the author, but none was found. In the following year the book was placed in the Index. In 1633 Casper Schoppe, a German scholar, published an account of a book which had fallen into his hands, and which proved to be the same as the *Monita Privata,* but had been obtained from a source independent of the first. In the British Museum there is a volume printed at Venice in 1596, which contains on several manuscript leaves, in writing of an ancient date, the whole of the *Monita Secreta.* In 1658, during Cromwell's administration, an edition of the book was printed in England. On the continent a French version was printed in 1661, and a second edition of Schopp's book in 1668. In 1669 Henry Compton, canon of Christ Church, Oxford, published an edition found in MS. in a Jesuit's closet after his death, thus supplying an additional copy independent of all the others. In 1713 Henri de St. Ignace published the *Monita Secreta* in an appendix to his work on the necessity of reforming the order. This passed through four editions. In 1717 the book was published at Amsterdam, and in 1727 at Cologne. After the suppression of the order in 1773 several MSS. were found in their colleges and other resorts. In 1782 a MS. found in Rome was printed there, as was thought by the editor, for the first time. In 1831 an edition was published at Princeton, N. J., and in 1844 it was reprinted at New York. In the 17th c. Dr. Johann Gerhard referred to the book as undoubtedly genuine, and his opinion was indorsed by nearly all Protestant church historians. M. Gachard, a man of great learning and sagacity, whose critical investigations Prescott and Motley highly esteemed, says that at the suppression of the Jesuit order in the Netherlands there were discovered in one of their colleges some of their most important papers, among which were the *Monita Secreta;* that a translation of the book was made by order of government, and still exists in the archives of the kingdom. This, he testifies, differs in nothing that is material from that which has been made public. On the other hand, the eminent church historian Gieseler decided against the genuineness of the book; Isaac Taylor, in his article on the Jesuits, contained in the 8th edition of the *Encyclopædia Britannica,* says that the *Monita* is believed to be a spurious production; and Prof. Schem, in the *Biblical Cyclopædia* of McClintock and Strong, says that the book was not written by a Jesuit, but is a satire.

MONITEAU, a co. in central Missouri, bounded n.e. by the Missouri river; drained by Saline, Moniteau, and Moreau creeks; 420 sq.m.; pop. '90, 15,630, chiefly of American birth. It is intersected by the Missouri Pacific railroad, and by a branch of the Wabash railroad. The surface is rolling and broken; in great part covered with valuable forests. Indian corn, wheat, oats, and pork are the staples. Iron, lead, bituminous coal, and several varieties of limestone used as building material, are found. There are several flourishing towns. Co. seat, California.

MONITEUR, LE, a celebrated French journal, started by the publisher, Charles Joseph Panckoucke, May 5, 1789, under the title of the *Gazette Nationale, ou le Moniteur Universel.* After the crisis of Aug. 10, 1792, its importance as a daily register of the events which occurred during the dark days of the revolution, immensely increased. Whoever wishes to obtain a complete view of the phenomena of the reign of terror, should consult Thuan-Grandville's *Gazette Nationale, ou le Moniteur Universel, commencé le 5th Mai,* 1789, *précédé d'une Introduction historique contenant un Abrégé des anciens Etats généraux, des Assemblées des Notables, et des principaux Evênements qui ont amené la Révolution* (1796). In 1800, it altered its form so far as to divide itself into two halves, of which the first contained the *actes du gouvernement.* This change imparted to the journal something of an official character. After Jan. 1, 1811, it dropped the title of

Gazette Nationale, retaining only that of *Moniteur Universel*. After the restoration, it became the government organ, which it continued to be until 1869, when its official connection was discontinued.

MONITOR, a name given to many species of saurian reptiles, nearly allied to the true lizards, from which they differ in having no teeth on the palate. Among them are some of large size, the largest of existing saurians except those of the crocodile tribe. The tail of the greater number is laterally compressed, the better to adapt them to aquatic habits. They receive the name monitor from a notion that they give warning by a hissing sound of the approach of a crocodile or alligator. For the same reason, some of the American species receive the French name *sauvegarde*. Those of the old world form the family *monitoridæ*, and those of America the family *teïdæ* of some naturalists. There are several genera of both.—The MONITOR or VARAN OF THE NILE (*M. Niloticus*) is of a rather slender form, and has a long tail. It is olive gray, mottled with black. It attains a length of five or six feet. Crocodiles' eggs form part of its food. The TEGUEXIN (*teius Teguexin*) of Brazil and Guiana is of similar size. It preys on aquatic animals. Other large species are plentiful in almost all tropical countries. They are powerful animals, have strong teeth, and defend themselves vigorously if attacked. Some comparatively small species, feeding chiefly on insects, are found in dry situations. Some of the large South American species are used for food.

MONITOR. See TURRET-SHIP.

MONITO'RIAL SYSTEM, or MUTUAL INSTRUCTION. It first occurred to Dr. Bell (q.v.), when superintendent of the orphan hospital, Madras, in 1795, to make use of the more advanced boys in the school to instruct the younger pupils. These youthful teachers were called monitors. The method was eagerly adopted by Joseph Lancaster (q.v.) who, in the first years of this century, did so much for the extension of popular education; and from him and the originator, the system was called indifferently the Madras and the Lancastrian, as well as the monitorial or mutual system. The monitorial system is not, as is commonly supposed, a method of teaching; it is simply a method of organizing schools, and of providing the necessary teaching power. At a time when the whole question of primary education was in its infancy, the state refusing to promote it on the ground that it was dangerous to society, and the public little disposed to contribute towards its extension, it was of great importance that a system should be adopted which should recommend itself as at once effectual and economical. It was manifest that even with the most skillful arrangement of classes, a single teacher could not undertake the tuition of more than 80 or 90 pupils; while, by the judicious employment of the cleverer boys under the general direction of the master, the school might be made almost self-working, and 300 or 400 children taught where there was only one adult superintendent. The novelty and economy of this plan, and we may add also, its temporary success, gained for it a large and enthusiastic support both in Britain and in Germany. But the importance of the system as an educational agency was universally overrated, for although it is to be admitted that, under an able and enthusiastic master, boys may be inspired to teach well all technical and rote subjects (as, for example, in the Latin and Greek classes under Dr. Pillans of the Edinburgh high school), yet it is manifest that children so instructed are not in any sense of the word educated. Their monitor necessarily lacks the maturity of mind which is indispensable to the instructor, whose business it is to arouse in the child those mental operations which have taken place within himself, and so lead him to an intelligent and rational grasp of intellectual and moral and physical truths. No amount of private instruction from the master, no enthusiasm could ever enable a boy to do this, and consequently the system broke down, after having done its work by being the engine whereby a large interest was stirred up in the education of the masses, and whereby the requisites of a primary teacher were brought into view. The reaction against the system, however, was not so violent in Great Britain or in Holland or France, as in Germany. In England, the monitorial system was modified in such a way as to secure for the master the aid of the more clever boys in teaching rote subjects, in revising lessons, keeping registers, and supervising the work of those classes not directly under the master's tuition. In this way were afforded the means of training for the teaching profession boys who seemed fitted by natural endowment for the work. Hence the prevalent employment in Gt. Britain of paid monitors and pupil teachers (male and female), who are regularly apprenticed to school-managers and teachers, and go forward to be trained in the normal schools now so numerous. The system never obtained a foothold in the United States.

MONK. See MONACHISM; MONASTERY.

MONK, GEORGE, duke of Albemarle, was the son of sir Thomas Monk of Potheridge, in Devonshire, and was born at his father's residence, Dec. 6, 1608. He spent some of his earlier years in the service of Holland, returned to England when about the age of 30, and served in the king's army against the Scots in 1639, attaining the rank of lieut.-col. On the breaking out of the Irish rebellion, in 1642, he was appointed col. of lord Leicester's troops, sent to crush it. When the civil war began, these troops were recalled, and Monk was imprisoned on account of being supposed to favor the cause of the parliament, but was soon after released. In 1664 he was defeated and taken prisoner by Fairfax,

and imprisoned in the Tower, from which he was liberated, after two years, on his swearing the Covenant. Clarendon hints that he sold himself for money. He was now intrusted with the command in the n. of Ireland. Cromwell had a high opinion of his military talents, and made him his lieut.-gen. and commandant of artillery; and the service which he rendered at the battle of Dunbar was so great, that he was intrusted with the chief command in Scotland. In 1653, he was joined with admiral Blake in an expedition against the Dutch, and with his division of the fleet, consisting of 100 ships, defeated admiral Van Tromp off Nieuwpoort, and fought another battle with him off Katwijk, in which the victory was doubtful, but Van Tromp lost his life. In April 1654, Cromwell sent him to Scotland as governor, in which difficult office he conducted himself with vigor, moderation, and equity. Even the highlands, those immemorial "sanctuaries of plunder," as Guizot calls them, were reduced to order. His principal residence was Dalkeith, where he spent his leisure hours in gardening, of which he was very fond. When, after Cromwell's death, he saw everything in confusion, and felt his own position perilous, he crossed the English border, Jan. 1, 1660, with 6,000 men, united his troops with those which Fairfax had collected for Charles II., and entered London unopposed, although as yet he kept his views profoundly secret. His powers of dissimulation and reticence were immense. Everybody felt that the decision lay with "Old George," as his soldiers used to call him; every party courted him; he was even offered the protectorate; but while he offended nobody, he declined to connect himself with any of the sectaries, and waited patiently the course of events. His own wish (though it did not proceed from any very high-minded motive) was to bring back the Stuarts; and before long, he saw that the nation in general was thoroughly with him. On the 21st of Feb. he called together the remaining members of the parliament which had been violently driven out 12 years before, and Charles II. was presently recalled. Monk was now made duke of Albemarle, loaded with honors, and intrusted with the highest offices in the state. But he soon retired from political affairs. In 1665, when the plague ravaged London, and every one fled that could, "Old George," as governor of the city, bravely stuck to his post, and did what he could to allay the terror and confusion. Next year, he was employed as second in command of the fleet sent under the duke of York against the Dutch; and was defeated by Von Ruyter in a sea-fight off Dunkirk, but soon after gained a bloody victory over him off North Foreland. He died Jan. 3, 1670. Guizot describes him as a "man capable of great things, though he had no greatness of soul." See Guizot's *Monk, Chute de la Republique,* Skinner's *Life of Monk,* Hallam's *Constitutional History,* and Macaulay's *History of England.*

MONKEY, *Simia,* a Linnæan genus of *mammalia,* of the Linnæan order *primates,* and of Cuvier's order *quadrumana,* now constituting the family *simiadæ.* The word monkey was formerly of almost, if not altogether, the same signification with *ape;* but the name *ape* is now more generally applied to those *simiadæ* which have no tail and no cheek-pouches; the name monkey to those which have cheek-pouches and long tails, prehensile or not prehensile; whilst the name *baboon* (q.v.) is applied to creatures considerably different from both. The smaller tailless *simiadæ* are, however, still not infrequently spoken of as monkeys, and the term is also sometimes used to comprehend all the *simiadæ.*

Of all animals, the *simiadæ* exhibit the greatest resemblance to man, both in their general form and their anatomical structure. This is particularly the case with some of the larger apes. In none of them, however, is there a natural adaptation for the erect position so characteristic of man, which is assumed rarely, and in general only by captive individuals, as the result of training and constraint, all of the monkey tribe preferring to walk on four feet rather than on two, but all of them being adapted for living chiefly among the branches of trees, or—according to the habits of a comparatively small number of species—among bushy cliffs, where they make use of the four extremities for prehension, as hands. Most of them leap from branch to branch with wonderful agility, and some also swing themselves from a branch by their long prehensile tail, till they can seize hold of another branch. The thumb, in all the four extremities, is opposable to the fingers, which are long and flexible; but there are some monkeys which want the thumb of the fore-limbs, or have it merely rudimentary, whilst the hind-limbs are always furnished with perfect hands. In attempting to walk erect, an ape necessarily treads, not on the soles, but on the sides of its feet, which are turned inwards, and the muscles of the legs do not enable it to maintain an erect position long or easily. This difficulty is increased by the way in which the head is affixed to the vertebral column, the *occipital foramen* being further back than in man, so that the weight of the head is thrown forward. The face of a monkey exhibits a grotesque resemblance to that of man; but the lower forehead, the less perfect nose, and the more projecting jaws, give it a brutal character. The dentition of monkeys is so similar to that of man, that the dental formula for very many is the same, although many others have an additional molar on each side of each jaw; but in many, the great size of the canine teeth is a marked brutal characteristic. The digestive organs are generally very similar to those of man, but in some of the *simiadæ,* more exclusively confined to vegetable food, there is a remarkable difference in a peculiar and very complicated structure of the stomach. The food of monkeys consists chiefly of fruits, corn, and other vegetable substances; but most of them also catch and eat insects, and even birds, of the eggs of which they are also very fond.

UNIVERSITY OF ILLINOIS
URBANA

In captivity they learn to eat and drink almost everything that is used by man, and show a great fondness for sweet things, and for alcoholic liquors. The skin of monkeys is generally covered in all parts with hair, but some have the face partially naked, and many have naked callosities on the buttocks. Many have capacious cheek-pouches, in which they stow away food which they cannot consume with sufficient expedition. They are mostly gregarious, although to this there are some exceptions. Many of the species display strong attachment to their mates and to their offspring. One or two young are generally produced at a birth. They display a remarkable propensity and talent for imitation; and this, with their extreme agility, their curious prying disposition, and their love of trick or mischief, makes them very amusing, whether in a wild or a captive state. Many of the stories told of monkeys manifest also a high degree of intelligence, although it may be doubted if the intelligence of any of the species exceeds that of the dog or the elephant. Notwithstanding their resemblance to the human form, their imitative propensity, and their intelligence, none of the monkeys show the smallest capacity for imitating the human voice; and their "chattering" is very unlike articulate speech.

The species of this family are very numerous, but are all confined to the warm parts of the world; Australia, however, and the South Sea islands being destitute of them. They are divided into a number of genera, some of which belong exclusively to particular portions of the world. But in this respect, the most remarkable circumstance is the difference between those of the old world and those of America, the geographical distribution corresponding with the division of the family into two principal groups—the monkeys of the old world (*Catarrhini* of some naturalists), to which alone the name *simiadæ* is sometimes restricted, having the nostrils separated only by a narrow septum, and the tail wanting, short, or long, but never prehensile; the monkeys of the new world (*Platyrrhini*), the family *cebidæ* of some naturalists, having the nostrils widely separated, the tail always long, and often prehensile, most of them having also the four additional molar teeth already noticed, which none of the monkeys of the old world possess; but none of them having cheek-pouches, which many of the monkeys of the old world have. The most interesting genera and species of monkey are noticed in separate articles.

MONMOUTHSHIRE, a maritime co. in the w. of England, bounded on the s. by the estuary of the Severn, on the n.e. by Herefordshire, and on the e. by Gloucestershire. Area, 347,011 acres. Pop. '91, 203,347. The chief rivers are the Usk, the Wye on the eastern border, and the Rumney on the western border—all of which flow s. into the estuary of the Severn. The coast-line, 22 m. in length, is indented only at the mouth of the Usk (which is navigable for vessels of the largest size to Newport), and at the mouth of the Wye, which vessels ascend to Chepstow. The surface is elevated in the n. and n.w. (the Sugar-loaf is 1856 ft. high), but the coast districts, comprising the Wentloog and the Caldecot levels, are low and rich, and are protected from the wash of the sea by sea-walls and earthworks. In the fertile valleys of the Usk and Wye, wheat is the principal crop; but in the less favored localities, barley and oats chiefly are grown. Coal, limestone, and ironstone abound in the mineral district of Monmouth, in the n.w. of the country. This district, comprising 90,000 acres, abounds in collieries and ironworks, and is a perfect network of railways. Monmouth was a Welsh county until the reign of Henry VIII., but the ancient language is now heard only in a few western districts. The scenery of this county is unusually beautiful; and in no part of England are to be found so many remains of feudal castles as in the eastern districts of this county. The chief remains are Raglan, Caldecot, and Chepstow castles; and Llanthony and Tintern abbeys (q. v.). Roman antiquities are numerous. The county sends three members to parliament.

MONMOUTH, a co. in e. central New Jersey, bounded on the e. by the Atlantic, and n. by Sandy Hook and Raritan bays; drained by the Neversink, Shrewsbury, Shark, and Tom's rivers, and intersected by the Central New Jersey, the Pennsylvania, and Freehold and Jamesburg Agricultural railroads; area, 475 sq. m.; pop. '90, 69,128, chiefly of foreign birth. The surface is very level, sandy near the sea, but fertile in the interior; potatoes, wheat, oats, butter, and hay are the staples; of potatoes, the annual yield is over a million bushels. Long Branch (q. v.), a fashionable wateringplace, is situated on the coast of this county. Co. seat, Freehold.

MON'MOUTH, a parliamentary and municipal borough and market-town of England, capital of the county of the same name, stands, amid beautiful scenery, at the confluence of the Monnow and the Wye, 17 m. s. of Hereford. Its church, dating from the 14th c., is surmounted by a lofty spire. Of its castle, the favorite residence of John of Gaunt, and the birthplace of Henry V., the ruins only remain. A building, said to be the study of Geoffrey of Monmouth, is all that exists of the Benedictine monastery. Railways connect the town with Newport on the w. and Ross on the e. Ironworks

employing a number of workmen, are in operation. Pop. (1891), 5,500. Monmouth unites with Newport and Usk in sending a member to parliament.

MONMOUTH, city and co. seat of Warren co., Ill.; on the Iowa Central, the Burlington route, and the Chicago, Rock Island, and St. Louis railroads; 17 miles e. of the Mississippi river, 179 miles s.w. of Chicago. It is the seat of Monmouth college (Unit. Pres.), and has the Warren county library, high school, business college, several national banks, waterworks supplied from artesian wells, gas and electric light plants, street railroad, manufactories of agricultural implements, sewer pipe, soap, cigars, foundry and machine products, one of the largest crockery ware plants in the United States, about 15 churches, and daily and weekly newspapers. The city has large agricultural, coal-mining, and horse-breeding interests. Pop. '90, 5,936.

MONMOUTH, JAMES, Duke of, natural son of Charles II., was born at Rotterdam in 1649. His mother, Lucy Walters, according to Evelyn, a "browne, beautiful, bolde, but insipid creature," came to England with her son in 1656, during the commonwealth. She is said to have been treated as though she had been the king's wife, and was committed to the Tower; but was soon allowed to retire to France, where she died. Charles sought out the boy, and committed him to the care of Lord Crofts, who gave him his own name. On the restoration, Monmouth, then "Mr. James Crofts," came to England with the queen-dowager, and was handsomely lodged at Hampton Court and Whitehall. These honors were, in after years, referred to by his followers as justifying their belief that he was indeed the king's legitimate son. A wealthy heiress, Anne, daughter of the earl of Buccleuch, was selected for his wife; and before he had completed his 16th year, he was married to her, and was created duke of Monmouth. About the year 1670, Shaftesbury put Monmouth forward as the head of the popular party, and rival of the duke of York (afterward James II.). At the period of Titus Oates's plot (1678), rumors that the "Protestant Duke" was indeed the king's legitimate son spread far and wide. The duke of York was compelled to quit the kingdom; and parliament brought forward a bill for excluding him from the succession, when Charles suddenly dissolved it. A document was at the same time issued by the king, solemnly declaring that he had never been married to Lucy Walters. Monmouth was sent into Scotland, in 1679, to quell the rebellion. He defeated the Covenanters at Bothwell Bridge; but his humanity to the fleeing and wounded was so conspicuous, and his recommendations to pardon the prisoners was so urgent, as to bring upon him the violent censures of the king and Lauderdale. He thus became the idol of the English Nonconformists. The return of the duke of York, and the exile of Monmouth, soon followed. In Holland, he allied himself to the leaders of the Nonconformist party, exiled like himself; and when he was allowed to return to London, he was received with such demonstrations of joy, that Monmouth felt that he was the people's choice. In 1680, he made a semi-royal progress through the w. of England, with the design, probably, of courting the Nonconformists, who were more numerous there than in any other part of the country, except London and Essex. In 1682, he traversed some of the northern counties. The king and his brother were alarmed; and Monmouth was arrested at Stafford, and bound over to keep the peace. He meanly confessed his participation in the Rye-House plot, accusing himself and others of a design to seize the king's person, and subvert his government. The king pardoned him, on his solemn promise to be a loyal subject to the duke of York, in case the latter should survive the king. In 1684, Monmouth fled to Antwerp, and remained abroad until the death of the king, when he resolved to embark for England. He landed (June 11, 1685) at Lyme-Regis, and issued a manifesto declaring James to be a murderer and usurper, charging him with introducing popery and arbitrary power, and asserting his own legitimacy and right by blood to be king of England. He was received with great acclamations at Taunton, where he was proclaimed as James II. At Frome, he heard the news of the defeat of Argyle, who, at the head of the Scottish exiles, had attempted to raise an insurrection in Scotland. Money and men were now abundant; but arms were wanting, and thousands went home for want of them. On July 5, he was persuaded, with only 2,500 foot and 600 horse, to attack the king's forces, which, under the command of the earl of Faversham, were encamped at Sedgemoor, near Bridgewater. Monmouth's troops were unable to cross a running stream or wide ditch which protected the camp, and were mowed down by the king's artillery. Their ammunition soon failed; and Monmouth having set a cowardly example of flight, his troops were slaughtered like sheep. About 300 of Monmouth's followers fell in the battle; but 1000 were massacred in the pursuit. Monmouth was found concealed in a ditch, and was brought to London. He made the most humiliating submissions, and obtained a personal interview with James. "He clung," says Macaulay, "in agonies of supplications round the knees of the stern uncle he had wronged, and tasted a bitterness worse than that of death, the bitterness of knowing that he had humbled himself in vain." Even his prayer for "one day more," that he might "go out of the world as a Christian ought," was brutally refused. On July 15, he was brought to the scaffold, and beheaded on Tower Hill; the executioner performing

his office so unskillfully that five blows were struck before the head was severed. The "Bloody Assize" afterwards commenced under Judge Jeffreys, when Monmouth's adherents paid a fearful penalty for their participation in his rash and ill-advised rebellion.

MONMOUTH, Battle of, so-called, though the battle occurred at Freehold, N. J., which is in Monmouth co., and which point sir Henry Clinton had reached, after his evacuation of Philadelphia, when attacked by Gen. Washington's little army. The battle took place June 28, 1778, and was opened by Gen. Lee, who commanded the advance of the American force, numbering about 4,000 men. Lee's attack was met by more serious resistance than he had anticipated; or, probably, his raw and worn-out volunteers, who had hardly yet recovered from the terrible winter at Valley Forge, were in no condition to fight the British veterans. A rout of the Americans was the result, and they fell back on the main body, which was commanded by Washington in person. The latter was enraged at seeing the disorderly retreat, and upbraided Lee in the most violent and bitter manner. He then took command himself, rallied the fugitives, and a sharp engagement commenced. The American force was advantageously posted on a height, protected by marshy ground, and where they could use their artillery with good effect. Lee was permitted to resume command of his men, and succeeded in holding his position until ordered at last to retire, which he did in good order. The left of the American line was commanded by lord Stirling, and here some sharp fighting took place, the British making strenuous but inadequate efforts to turn it. Failing in this, they directed their attention to the American right, under Greene, with Wayne posted in good position in an orchard, where he succeeded in keeping up a galling fire upon the enemy, under cover of the trees. The latter made every effort to oust the Americans from this position; and here Col. Moncton fell at the head of his grenadiers while making an attack. It becoming evident to the British commander that the Americans were too strongly placed to be dislodged, he ordered his men to fall back. The battle ended with this movement, the Americans not being strong enough to follow up their slight advantage; and during the night the British made a hurried retreat, undiscovered. This was one of the occasions during his life when Gen. Washington completely lost his temper; and for the error or cowardice which occasioned this, Lee was court-martialed, and his command was taken from him for one year.

MONNIER, Henri Bonaventure, b. Paris, 1799–1877; educated in Paris, taking up the pencil and pen after essaying trade. In 1825 his pen-sketches had already attracted much attention, and he increased the reputation of his work by its circulation through the then new art of lithography. In 1826 he illustrated the poems of Béranger and the fables of La Fontaine, and increased his reputation for the creation of character types. After becoming famous for this work, he began to write laughable mimicries of humorous scenes in the lives of the people of the street, of which his works published in 1830, entitled *Scènes Populaires* and *Mémoires de Joseph Prudhomme,* are examples. In 1831 he became an actor at the *théâtre de Vaudeville,* where his original humor as an actor made him a great favorite, excelling particularly in the representation of scenes of his own creation, which were introduced in the first play in which he took part, entitled *Famille Improvisée.* His ambition was soon sated with success as an actor, and his pen resumed work on comedies that needed no stage to enhance their effect, and which have become classic among the French. Among them are: *Un Voyage en Hollande; Les Bourgeois de Paris; Roman chez la Portière; Le Bonheur de Vivre aux Champs; Peintres et Bourgeois;* and *Les Métamorphoses de Chamoiseau,* several of which are adapted to the stage.

MONNIER, Marc, b. in Italy, 1829; became a resident of Paris, where he was a student of history, literature, and manners; and published esteemed works both in prose and verse. In later years he was one of the editors of the *Journal des Débats.* Among his historical works are: *La Conquête de la Sicile par les Saracens,* 1847; *Protestantism en France,* 1854; *L'Italie, est elle la Terre des Morts?* 1859; *Garibaldi, Histoire de la Conquête des Deux Siciles,* 1861. Of works of another character are: *La Vielle Fille; La Tante Jeanne; Les Amours Permise.* Of comedies and *marionettes* are *Le Roi Babolein; Le Curé d' Yvetot; La Ligne Droite; Mouche du Coche;* and *Aïeux de Figaro.* A volume of his poems was published in Paris in 1871. He d. 1885.

MONO, a co. in e. California, between Nevada and the Sierra Nevada mountains; 3384 sq.m.; pop. '90, 2062, chiefly of American birth. The surface is irregular, intersected by numerous mountain offshoots and hills, between which are arable valleys. Some of the plain country is adapted to grazing. Much of the county is heavily wooded with spruce and pine. Owen's river flows through the s., and the branches of Walker's river through the north. Gold and silver are found in paying quantities in the n.w. part. Wheat is being cultivated with success, and there are saw and quartz mills. Co. seat, Bridgeport.

MONOCENTRIS JAPONICUS, a species of fish which is an inhabitant of the Chinese and Japanese seas, for which a family, *monocentridæ,* and a genus *monocentris,* have been created. It belongs to the order *teleostic,* sub-order *acanthopteri.* It has a compressed, somewhat oblong body, with large scales in the form of osseous plates; eyes large and lateral; teeth villiform, both on jaws and palate bones; branchiæ large; dorsal

fins two, first one very spiny, having but little connecting membrane; the second dorsal fin opposite the anal, and similar. The ventral fins each have a single strong spine and two or three short rays.

MO'NOCHORD, an apparatus constructed to exhibit the mathematical proportions of musical intervals. It consists of a flat board of 4 or 8 ft. long, better 16 ft. where space can be spared. The breadth of the board is according to the number of the strings, which are from 2 to 6. The board is covered with fine white paper. A straight line is drawn from end to end below each string, and each line is accurately divided into the different proportions into which the full length of the string, as a fundamental sound, harmonically divides itself. See HARMONICS. The string is fixed at one end, and rests on a bridge; while at the other end, where it also rests on a bridge, it is stretched by a tuning-peg, or by a weight. The sounds from the strings are produced by a violin-bow. The monochord is chiefly used in illustrating acoustical experiments in the proportion of intervals and temperament. See illus., SOUND, vol. XIII.

MONOCHROME is a painting done in the various shades of a single color.

MONOCOTYLED'ONOUS PLANTS, plants in which the embryo has one and only one cotyledon or seed-lobe. The cotyledon in these plants varies extremely in form, and is often comparatively of great size, but has always a slit, from which, as germination takes place, the gemmule sprouts. The gemmule in elongating assumes an acuminated shape. Monocotyledonous plants are all endogenous (q.v.); except the dictyogens (q.v.), in which the endogenous structure is not perfectly exhibited. They are also *endorhizal* (Gr. *endon*, within, *rhiza*, a root); that is, the radicle is covered with a cellular sheath, and gives rise to fibrils similar to itself in structure. The leaves are generally sheathing at the base, and there embrace the stem; they also generally have simple parallel nerves connected by cross veins, the leaves of dictyogens alone being reticulated. The number of the parts of the flower is generally 3, or a multiple of 3. The floral envelopes, often splendid, as in lilies, tulips, etc., are generally united as a perianth (q.v.), instead of forming a distinct calyx and corolla. The principal natural orders of monocotyledonous plants are grasses, *cyperaceæ*, palms, orchids, *scitamineæ*, *musaceæ*, *liliaceæ*, and *iridaceæ*. The general appearance of monocotyledonous plants distinguishes them almost as perfectly as any structural characters.

Of the fossil remains of the vegetable kingdom, the smallest portion consists of monocotyledonous plants.

MONOD, ADOLPHE FRÉDÉRIC THEODORE, 1802–56; b. Copenhagen. His father, Jean, residing in Paris as pastor of a French Protestant church, the son was educated at the Collège Bonaparte, Paris, and then studied theology at the university of Geneva, remaining till 1824. In 1825 he visited Italy, and preached to a small Protestant congregation at Naples until 1827. Returning, he was appointed pastor of Lyons, but, his evangelical and earnest preaching being disliked, he was removed. His congregation then met in a private room, and soon in a spacious chapel, and at the end of 30 years the evangelical church of Lyons had 4 pastors, many evangelists, and 8 chapels. He was appointed by the government professor of theology at Montauban, where he remained 11 years. While filling this office he traveled in southern France, preaching and instructing the people, who were attracted by the power of his discourses. Though holding the views of his brother in regard to the divinity of Christ, he remained in the national church, and in 1849 succeeded his brother as pastor at Paris, being appointed by the consistory of Paris, the government confirming the selection. The large oratoire was filled every Sunday, and the small room was used for Bible lessons, many preferring these to his greater sermons. In 1856 he was suddenly stricken down, and his disease pronounced incurable. He was a man of great spiritual power, a sympathizing heart, highly cultivated mind, and lofty imagination. He was an eloquent preacher. His literary works were chiefly sermons. In 1844 he published a volume of sermons. He is the author of *Lucile, ou la Lecture de la Bible; La Femme; Saint Paul.*

MONOD, FRÉDÉRIC JOËL JEAN GÉRARD, 1794–1863; b. Monnaz, canton de Vaud, Switzerland; educated at Geneva; entered the ministry in 1820, and succeeded his father as pastor of the national Protestant church of France in Paris. He established in 1824 the *Archives du Christianisme*, the chief organ of the evangelical French Protestants, and continued its editor until his death. After officiating 12 years as pastor of the oratoire, he united with De Gasparin and others in an attempt to restore a rule of faith in the reformed church which would exclude rationalists, by making an acknowledgment of the divinity of Christ essential to membership. Failing in this, they left the national Protestant church in 1849, and organized independent congregations which resulted in the formation of the Free evangelical church of France. Associated with Monod were count de Gasparin, E. de Presseusé, and pastor Fisch. The influence of the Free Church has been so great that the majority of the state church are now represented to be evangelical. In 1858 Monod visited the United States to interest the churches here in their new movement. He greatly admired American institutions, and referred to this country as evidence of the advantage of entire separation of church and state. During the war of the rebellion, he ardently espoused the side of the national government, and was one of the originators of the address which was signed by the majority of the Protestant

French ministers, declaring that "the triumph of the rebellion would throw back for a century the progress of Christian civilization and of humanity, raise the hopes of the favorers of slavery and the slave trade, and would give a sad blow to the work of evangelical missions." The address produced a marked change of opinion toward the United States not only in France, but also in England. He published a few pamphlets and several sermons, but most of his writings are in the *Archives du Christianisme.*

MO'NODON. See NARWHAL.

MONODY (Greek, *Monodia*, a solo) is a poem usually of a mournful character, in which the mourner is supposed to lament alone. Tennyson's *In Memoriam* is a fine example of a monody; another is Milton's *Lycidas.*

MONŒ'CIOUS (Gr. *monos*, one, and *oikion*, a habitation), the term used in botany to describe those plants which have the male and female parts of fructification (*stamens* and *pistils*) in different flowers, but upon the same plant. The flowers of such plants are also said to be *monœcious.* Monœcious plants form one of the classes of the Linnæan artificial system, but many occasional instances of monœcious species are to be found in genera belonging to other classes. Common examples of monœcious plants are the hop, box, birch, beech, alder, oak, and hazel.

MONOGRAM (Gr. *monos*, alone, and *gramma*, letter), a character composed of two or more letters of the alphabet, often interlaced with other lines, and used as a cipher or abbreviation of a name. A perfect monogram is one in which all the letters of the word are to be traced. The use of monograms began at a very early date. They are found on Greek coins, medals, and seals, and are particularly numerous on the coins of Macedonia and Sicily. Both on coins and in MSS. it was the practice to represent the names of states and cities by monograms, of which above 500 are known, but some have not been deciphered. Monograms occur on the family coins of Rome, but not on the coins of the earlier Roman emperors. Constantine placed on his coins one of the earliest of Christian monograms, which is to be traced in the recesses of the catacombs, composed of the first and second letters of ΧΡιστος (Christus), a monogram which also appeared on the Labarum (q.v.), and was continued on the coins of the succeeding emperors of the east down to Alexander Comnenus and Theodorus Lascaris. We often find it combined with the first and last letters of the Greek alphabet (Rev. i. 8). Another well-known monogram is that of the name of Jesus, IHS, from the first three letters of ΙΗΣοῦς.

Popes, emperors, and kings of France during the middle ages were in the practice of using a monogram instead of signing their names. Almost all the coins of the French kings of the Carlovingian race bear their respective monograms, as also do those of Alfred and some of the other Saxon kings of England.

Painters and engravers in Germany and Italy have used monograms to a large extent as a means of distinguishing their works. In these, the initial letters of their names were often interwoven with figures of a symbolical character, so as to form a rebus on the artist's name. The first typographers distinguished their publications by wood-cut vignettes, whose invention is ascribed to the elder Aldus; but besides these, each made use of a monogram or cipher, a series of which, well known to the bibliographer, fixes the identity of the ancient editions, German, Italian, and English, from the invention of printing down to the middle or end of the 16th century. For a detailed account of the monograms of early printers and others, see Brulliot, *Dictionnaire des Monogrammes* (Munich, 1832–34): Horne's *Introduction to Bibliography*, vol. ii.; and Herbert's and Ames's *Typographical Antiquities.*

MONOGRAPH, a work in which a particular subject in any science is treated by itself, and forms the whole subject of the work. Monographs are entirely of recent date, and have contributed much to the progress of science. In botany especially, monographs of orders and genera are very numerous; and some of them are among the most splendid and sumptuous of scientific works.

MONO LAKE, in Mono co., Cal., measures 13½ miles from e. to w. and 11 from n. to s. Its waters are intensely salt and alkaline, and no fish are found in them, although there are large quantities of brine shrimps and larvæ of insects. Among the various salts which the waters contain are sodium chloride, sodium carbonate, bicarbonate and sodium sulphate. The marks of the old shores of the lake show that at one time its area and depth were far greater than at present. It has no outlet. Altitude, 6,380 feet.

MONOLITH, a monument, column, obelisk, statue, or other structure formed of a single stone. In India there are examples of monolithic temples, the whole being cut out of the solid rock. At Baalbek, Syria, one stone has a length of 70 feet, a width of 21 feet, and a thickness of 14 feet. A shaft quarried at Vinal Haven, Me., is 115 feet long, 10 feet square at base, and weighs 150 tons. The monument erected to General John E. Wool, at Troy, N. Y., is a monolith 75 feet high.

MONOMA'NIA has loosely been made to represent every form of partial insanity; but has been more rigidly defined as that mental condition in which a single faculty, or class of faculties or associations, become diseased, the mind generally remaining healthy. Slight and solitary aberrations, such as where a savage antipathy to cats coexists with a love for human kind; where there appears to be an incontrollable tendency to steal, to squander, to drink, to destroy, are of common occurrence, and are supposed to be com-

patible with the exercise of intelligence, and with the discharge of many of the ordinary duties of life. By a more strict limitation, the term has been confined to such affections as involve the emotions and propensities alone. It is, however, held that, notwithstanding its apparent integrity, the whole mind is involved or influenced by the presence of such morbid conditions, at least while they are predominant. It is undoubtedly difficult to point out in what manner the belief, e.g., that a particular organ has been transmuted into glass, can interfere with or render the memory, or the power of instituting comparisons, defective and untrustworthy; yet it is legitimate to receive with caution *every* manifestation of powers so constituted that they fail to detect the incongruities and absurdities with which they are associated; or, having detected the real character of these errors, are unable or unwilling to cast them out, or to disregard them. There is much countenance given to this theory by facts which indicate that even trivial forms of mental obliquity are connected with an unsound organization; and that particularly and rarely recognized monomanias are invariably associated with the *same* structural alteration. The unhealthy elevation of the sentiment of cautiousness, for example, especially where it amounts to fear of death, panic, or panphobia, is a symptom of disease of the heart and large blood-vessels; while the monomania of ambition, or optimism, as it has been styled, is the concomitant of the general paralysis of the insane. It will be obvious, from the definitions previously introduced, that the species or varieties of monomania must correspond to the faculties or phases of the human mind, and to their combinations. Several great divisions, however, have been signalized, both on account of their frequency and of their influence upon the individual and upon society. 1. Monomania of suspicion, comprehending doubts in the fidelity and honesty of friends and those around, belief in plots and conspiracies, the dread of poison; and where, as is often the case, it is conjoined with cunning, the propensity to conceal, mystify, and deceive. This malady has frequently been observed in intimate connection with cancer and malignant growths. 2. Monomania of superstition and unseen agencies, where credulity, mingled with religious awe, peoples the external world with specters, omens, mysteries, magnetism; and the imagination with horrors or ecstatic reveries. Insensibility to pain, or indifference to external injuries, has been observed as a characteristic of individuals affected with this disease. 3. Monomania of vanity, or euphoria, where display and ostentation are indulged, without reference to the position and means of the patient. 4. Monomania of fear. 5. Monomania of pride and ambition. 6. Kleptomania (q.v.). 7. Dipsomania (q.v.). If it can be proved that such morbid tendencies, as have been here mentioned, and others still less prominent, are merely salient points of a great breadth and depth of mental disease, the plea of insanity may justifiably be employed.

MONONA, a co. in w. Iowa, on the Missouri; 684 sq.m.; pop. '90, 14,515, chiefly of American birth. The little Sioux river flows through it. It is chiefly fertile prairie. Indian corn, wheat, and oats are raised. Co. seat, Onawa.

MONONGAHELA, a river which rises in the Alleghany mountains of West Virginia in two branches, West Fork and Tygart's Valley river. Flowing northward and receiving the Cheat and the Youghiogheny, it unites with the Alleghany at Pittsburg to form the Ohio. Its total length is 300 miles, but for forty miles only, to Brownsville, is it navigable for steamboats. Keel-boats ascend 200 miles. Its most important tributary is the Youghiogheny. The Monongahela flows through a country abounding in bituminous coal.

MONONGALIA, a co. in n. W. Va., next to Pennsylvania; 325 sq.m.; pop. '90, 15,705, with colored. The surface is irregular, and Laurel hill, a w. offshoot of the Alleghanies, traverses the e. part. The soil is rich, and produces good crops of Indian corn, wheat, oats, and potatoes. The Monongahela and Cheat rivers flow through it. There are large forests, and deposits of bituminous coal. Co. seat, Morgantown.

MONOMETALLISM. See BIMETALLISM.

MONOPE'TRAL, a temple formed of an open circle of columns carrying a roof, and without a cell.

MONOPHYSITES, the name given to a widely ramified sect of Christians who hold that Christ has only *one* nature (Gr. *monos*, one; *physis*, nature), a human nature become divine. Monophysite views were first decidedly put forward in the controversy against Nestorius. Cyril having expressed the opinion that the flesh of the Logos was essential to his personality, the archimandrite Eutyches (q.v.) went on to assert a deification or apotheosis of the flesh of Christ, and obtained the consent of a synod at Ephesus, in 449, commonly called the "synod of robbers," to this doctrine; but he and his adherents (at first called after him EUTYCHIANS) were condemned as heretics by the council of Chalcedon in 451. It was after this council that the name *Monophysites* began to be used. The decision of the council, however—viz., that in Christ *two* natures, neither interfused, changed, nor divided, were united in *one* person, and constituted *one* hypostasis—was not calculated to allay, but rather to increase discord. Accordingly, the strife grew hotter. The Asiatic and Egyptian clergy, strongly opposed to Nestorianism, were generally inclined to Monophysite views, and received countenance from the emperor Basiliscus. After long, and often bloody contests between the supporters of the opposite opinions, the Monophysites, formerly separated from the orthodox church. This sepa-

ration took place in the first half of the 6th c., when the imperial protection hitherto bestowed upon them was lost by the alliance of the emperors Justin and Justinian with the Latin church. Besides, they had not maintained unity among themselves. As early as 482, when the emperor Zeno published his famous *Henoticon*, or formula of concord, it was accepted by several of the more moderate Monophysites. This roused the indignation of the extremer sectaries; they renounced fellowship with their laxer brethren, and formed a sect of their own. They were called *Akephaloi*, and formed the *ultras* among the Monophysites. Controversies arose also in 519 on the question, whether or not the body of Christ was corruptible. The Severians—adherents of Severus, a deposed bishop of Antioch—affirmed that it was; the Julianists, or Gajanites, followers of bishop Julianus or Gajanus, denied it. The former were consequently called (Gr.) *Phthartolatrists*, (Lat.) *Corrupticolæ* (worshipers of the corrupt); the latter, *Aphthartodocetæ* (believers or teachers of incorruption), and sometimes—as an incorruptible body could only be apparent, and not real—*Phantasiasts*. The *Aphthartodocetæ* split again on this other point—whether or not Christ's body was created; the *Aktistetoi* (Gr. *ktizo*, to create) asserting that it was not created, and the *Ktistolatrists*, that it *was*. The Severians, called also, after one of their bishops, *Theodosians*, finally got the upper hand, and excommunicated their opponents, including another sect, the *Agnoetoi*, who denied that Christ as a man was omniscient. About 560 the Monophysite Askusnages, and after him the Christian philosopher Philoponus, ventured to speak of the three persons in the Godhead as three gods. This, however, was reckoned heretical even by the Monophysites themselves, and was the occasion of a large recession to the bosom of the Catholic church. Monophysite communities continued strongest in Egypt, Syria, and Mesopotamia, where they maintained a regular ecclesiastical order under their own patriarchs of Alexandria and Antioch; and after the Syrian, Jakob Baradæus (Al-Baradai, died about 578), had drawn up for them an ecclesiastical constitution, they formed the independent churches of the *Jacobites* (q.v.) and *Armenians*. See ARMENIAN CHURCH. The Coptic and Abyssinian churches are also Monophysite in doctrine.

MONOP'OLI, a t. of southern Italy in the province of Apulia, situated on the Adriatic shore, in a pleasant and healthy plain, 25 m. e.s.e. of Bari. Pop. about 13,200. It is supposed to be of Grecian origin, the name in Greek signifying the *solitary city*. It is surrounded by walls, and has a fortress constructed in 1552 by Charles V. The neighboring territory yields an immense quantity of olive oil.

MONOPOLY, from the Greek, signifies sole selling or individual selling, and has always been used to express a limitation to one or more persons of the right or power to conduct business as a trader. It is generally used in a bad sense to express something injurious, but economic science has lately very much narrowed the field over which its injurious character is supposed to extend. In the first place, it must be created by force; if it come in the natural course of trade, it is generally beneficial. Thus, to a village where three or four traders have conducted a small lazy business, drawing large profits, there comes a capitalist, who sets up a large concern on the ready-money system, and, by selling good articles at a low rate, absorbs all the business. He is of course abused as a monopolist by the ineffective persons he has superseded; but his presence is a blessing to the community generally. If, however, he had gone to the village, not to compete with others, but with a royal patent in his pocket securing to him the exclusive trade of the village, as he could sell at his own price, and make a fortune without trouble, he would of course be, like the old royal monopolists, a calamity to the people.

A careful distinction must be preserved between monopoly and property—that is to say, an exclusive right to *trade* must be separated from an exclusive right to *possess*—for, while the law of property exists, possession will always be exclusive. If, then, a trade can only be conducted with large capital, it must fall to those who either singly, or by co-operation, can command that capital; and the answer to all complaints on the part of others is, that since capitalists can best serve the public, it is best for the public that capitalists should be allowed to do so. The old corn-laws and landed property conjoined to produce one of the best illustrations of the distinction. The power of producing grain within England, for example, has always been limited to those who have, either as owners or tenants, the command of the land. Forfeit all the land in that country to-morrow, and proclaim the production of grain to be free, the result would only be a change of ownership; for those who by their good-luck, or more probably by their power, got hold of rich old wheat-lands, would produce their grain much cheaper than those who got the poor lands, and, selling the produce at the same price, would pocket the difference, which would, in fact, just be rent gained by them as the new landlords. But when dealers offered the people grain from abroad, and the corn-laws rendered it impossible to sell that grain in that country, then there was a monopoly in favor of the home-producer, having the effect of artificially raising prices, and otherwise disturbing trade.

A deal of legislation was wasted by our ancestors in enactments to prohibit people from creating monopolies by that fair competition which is now considered the true healthy development of trade. Some account of them and of their repeal is given under ENGROSSING AND REGRATING. When British trade was increasing in the 16th c., it found some old powers alleged to be inherent in the royal prerogative of conferring exclusive

trading rights, which led to much oppression and loss. In Queen Elizabeth's parliament of 1597 a complaint was made that, for the benefit of favored courtiers, oppressive monopolies had been granted, not only for the sale of foreign luxuries, but for salt, leather, coal, and other articles of ordinary consumption. Queen Elizabeth said she "hoped her dutiful and loving subjects would not take away her prerogative, which is the choicest flower in her garden, and the principal and head pearl in her crown and diadem." Parliament returned to the charge, however, in 1601, when, on the reading over of the list of monopolies, a theatrical scene occurred by a member calling out: "Is not bread among the number?" and on this producing a sensation, continuing: "Nay, if no remedy is found, bread will be there before the next parliament." In 1621 parliament took proceedings against sir Giles Mompesson, charged with an oppressive use of his patent's monopoly. Four years afterwards, an act was passed limiting this power in the crown. It leaves only the right to grant a limited monopoly in the manufacture of his invention to any inventor, and this is the origin of the English patent law, and of the American patent law, which is based upon it. See PATENT, COPYRIGHT, TRUSTS.

MONOPTERUS JAVANENSIS, a peculiar species of eel found in the East Indian seas and along the coasts of China and Japan. It has a more elongated body than most eels; teeth small and embraced in a narrow band; branchial apertures meet in a medium slit beneath; no caudal or pectoral fins; dorsal and anal fins rather small.

MONOS'TOMA, a genus of trematoid worms, so called from having only a single sucker, which is situated anteriorly, and surrounds the mouth. It belongs to the *trematoda digenea* (of Van Beneden), all of which present the phenomena of alternation of generations, the earlier or larval forms occurring chiefly in molluscs, while the perfect worms are found, for the most part, in vertebrated animals. Among the species of this genus occur *M. flavum,* found in water-fowl (the larva being the *cercaria ephemera,* which is common in *planorbis,* etc.), *M. mutabile,* found in various birds, and *M. lentis.* The last-named species derives its specific name from its having been found by Van Nordmann in a lens extracted in a case of cataract. Cobbold and other distinguished helminthologists are inclined to believe that this is not an independent species, but that it is identical with the *distoma ophthalmiobium* of Diesing.

MONOTHEISM, the term usually employed to denote a belief in the numerical unity (*unus numero*) of the Godhead, or belief in and worship of one God. It is thus the opposite of *polytheism.* See GOD. The "doctrine of the Trinity" is thought by some to be incompatible with the monotheism taught by Jesus Christ, and is therefore rejected as no part of his teaching. See UNITARIANS. Mohammedans and Jews hold the doctrine of the "unity of God," even more rigorously in some respects than modern Christians: at least they reject with vehemence the least approach to a Trinitarian conception of the Deity. The majority of mankind are polytheists.

MONOTH'ELISM (Gr. *monos,* single, and *thelein,* to will), a modification of Eutychianism, which was introduced after the condemnation of that doctrine by the council of Chalcedon. It consisted in maintaining that, although Christ had two natures, yet these natures possessed or acted by but a single will, the human will being merged in the divine, or absorbed by it. The author, or at least the most active propagandist of this doctrine, was Sergius, patriarch of Constantinople, who obtained for it the support of the emperor Heraclius; and its progress was materially forwarded by the silence which, at the instance of Sergius, and under his representations, the pope, Honorius (q.v.), was induced to maintain regarding the question. The doctrine was formally condemned in the sixth general council held at Constantinople in the year 680, with which condemnation it is commonly said that the early controversies on the incarnation were ended. See EUTYCHES and MONOPHYSITES.

MONOTH'ELITES (see MONOTHELISM), persons in the early church who, in the effort to explain the mystery of Christ's person, said that he possessed only one will. Eutyches, about the middle of the 5th c., had taught that Christ had only one nature, his human nature having been *absorbed* by his divine. The impersonal human nature, he said, was assimilated and, in a manner, deified by the personal Logos, so that his body was not of the same substance as those of mankind generally, but was a divine body. All human attributes, also, in his opinion, were transferred to the one subject, so that it must be said, God was born, God suffered, was crucified, and died. The monophysites, in distinction from the Eutychians, held that the two natures were so *united* as to become only one nature. And these were followed by the monothelites, who maintained that Christ, though retaining two natures, had only one will, the human will being merged in the divine. That is, while speaking of two natures, they were in fact Eutychians so far as respected the faculty of the will. This theory was made prominent in the effort of the emperor Heraclius to compose the disputes in the church, and especially to bring back the Eutychians and monophysites, the latter of whom were very powerful. Their leader, Cyrus, patriarch of Alexandria, called a synod, 633 A.D., which approved the monothelite statement, and with good effects at least for a time. Many Eutychians in Armenia, Egypt, and other remote districts, were brought back to the church. The decision, however, was opposed by Sophronius, a monk of Palestine, who, on being made patriarch of Jerusalem, did not hesitate to resist both the open approval

of it by the patriarch of Constantinople and the tacit consent yielded to it by the pope of Rome. He soon summoned a council, which condemned the doctrine of the one will as being a part of the Eutychian heresy. This decision, in its turn, was condemned by the emperor Heraclius, who issued a decree forbidding all controversy on the subject; but his influence in upholding monothelism was soon arrested by his death; and, after much controversy and mutual condemnation, the first synod of the Lateran, 649, adopted the doctrine of the two wills and two energies. The final condemnation of monothelism was pronounced at the 6th general council, Constantinople, 680, where it was declared that there are in Christ two natural wills and two natural operations, without division, conversion, or change; with nothing like antagonism or like confusion; but at the same time that the human will could not come into collision with his divine will, but is in all things subject to it.

MONOTREM'ATA (Gr. *monos*, single, *trēma*, an opening), the lowest order of mammalia, in many of their characteristic points indicate an approximation to birds. The skull is smooth; the brain-case very small as compared to the face; the snout much prolonged, and the jaws unprovided with soft movable lips, and not furnished with teeth. (In the ornithorhynchus there are two horny plates in each half-jaw, which act as teeth, while in the echidna even these substitutes for teeth are wanting.) The cranial bones coalesce, as a bird's, at a very early period, and leave no signs of sutures. The external ear is altogether absent; while the eyes, though small, are perfectly developed.

The bones of the shoulder, forming the scapular arch, are unlike those of any other mammals, and in some respects resemble those of birds, and in other respects those of reptiles. At the top of the sternum is a T-shaped bone, formed by the union of the two clavicles, corresponding to the *furculum* in the bird's skeleton. The coracoid bones, which in other mammals are mere processes of the scapula, are here extremely large, and assist, as in birds, in strengthening the scapular arch; while the scapulæ themselves are produced beyond the socket of the humerus (the glenoid cavity), so as to articulate with the sternum.

The pelvis is provided with marsupial bones, although these animals do not possess a pouch.

The feet have five toes, armed with long nails; in addition to which, the hind-feet of the males are provided with a perforated spur-like weapon, which is connected with a gland. The Australian aborigines believe the wounds made by this spur to be poisonous; but there is no scientific evidence of the fact.

The ovaries are analogous to those of birds, the right ovary being comparatively undeveloped, while the left forms a racemiform mass. The orifices of the urinary canals, the intestinal canal, and the generative canal, open, as in birds, into a common cloaca, from which circumstance the order *Monotremata* derives its name. The mammary glands, of which there is only one on each side, are not provided with nipples, but open by simple slits on each side of the abdomen.

This order includes only two or three species, all natives of Australia or Van Diemen's Land, which, however, form two families—the *ornithorhynchidæ* (see DUCK-BILL), and the *echidnidæ* (see ECHIDNA).

No fossil remains of any animals of this order have as yet been discovered.

MONOTROPA'CEÆ, a small natural order of exogenous plants, allied to *ericeæ* and *pyrolaceæ;* but remarkably differing from both in their habits. They are herbaceous plants with scales instead of leaves, and grow parasitically on the roots of pines and other trees, in the northern parts of the world. A common American species is *monotropa hypopitys*, sometimes called *false beech-drops*. The whole plant has a pleasant smell.

MONREA'LE, a city of the island of Sicily, province of Palermo, and 5 m. s.w. of the city of that name, on the flank of a steep hill. Pop. 13,900. It has a cathedral, a palace, several conventual establishments, and possesses a healthy climate. Its chief source of wealth is its export trade in oil, corn, and fruit, almonds being one of its most important products.

MONRO, ALEXANDER, an eminent anatomist, and founder of the medical school of Edinburgh, styled *primus* to distinguish him from his son and successor, was b. at London, Sept. 8, 1697. His grandfather, sir Alexander Monro of Bearcrofts, a colonel in the army of Charles II. at the battle of Worcester in 1651, was afterward an advocate at the Scottish bar; and his father, John Monro, for some years a surgeon in the army of King William, in Flanders, on leaving it, entered into practice in Edinburgh. Alexander studied at London under Cheselden, at Paris under Bouquet, and at Leyden under Boerhaave, and in 1719 passed as a surgeon at Edinburgh. In Jan., 1720, he was elected by the town-council first professor of anatomy in the university. Of the establishment and building of the royal infirmary of Edinburgh, he was one of the two principal promoters, and after it was opened, he delivered clinical lectures there for the benefit of the students. In Jan., 1756, he received the degree of M.D., and in March following was elected a fellow of the Royal College of Physicians of Edinburgh. In 1759 he resigned the anatomical chair to his youngest son, the subject of the following notice, but continued his clinical lectures at the Infirmary. His principal works are—*Osteology, or Treatise on the Anatomy of the Bones* (Edin. 1726, 8vo); *Essay on Comparative Anatomy* (Lond. 1744, 8vo); *Observations, Anatomical and Physiological* (Edin. 1758, 8vo); and an

Account of the Success of Inoculation of Small-pox in Scotland (Edin. 1765, 8vo). He was secretary of a society at Edinburgh, which published six volumes of *Medical Essays and Observations*, many of them contributed by himself. Two more volumes of *Essays, Physical and Literary*, were subsequently issued by the same society, under the name of the Philosophical Society. Dr. Monro died July 10, 1767. He was a fellow of the Royal Society of London, and a member of the royal academy of surgery of Paris.

MONRO, ALEXANDER, *Secundus*, an eminent physician and medical professor, youngest son of the preceding, was b. at Edinburgh, Mar. 24, 1733. He studied at the university of that city; and in Oct., 1755, obtained the degree of M.D. In July following he was appointed joint professor of anatomy and surgery with his father in the university of Edinburgh. He attended for some time the anatomical lectures of Prof. Meckell at the university of Berlin. He also visited Leyden. Admitted a licentiate of the Edinburgh royal college of physicians, 1758, he was elected a fellow, 1759, and was afterwards president. On the resignation of his father in the latter year, he became full professor of anatomy, and also succeeded him as secretary of the Philosophical Society, which in 1783 was incorporated by royal charter, and took the name of the royal society of Edinburgh. In 1757 he published at Berlin a short treatise, *De Venis Lymphaticis Valvulosis*, in support of the theory, that the valvular lymphatics over the whole of the animal body are one general system of absorbents; which led to a controversy with Dr. William Hunter, of London. Among his other works are—*On the Structure and Functions of the Nervous System*, a large illustrated folio volume (Edin. 1783); *On the Structure and Physiology of Fishes*, also an illustrated folio volume (Edin. 1785); *Description of all the Bursæ Mucosæ of the Human Body* (Edin. 1788); and *Three Treatises on the Brain, the Eye, and the Ear*, illustrated by plates (Edin. 1797, 4to). He was a member of the royal academies of Paris, Madrid, Berlin, Moscow, and other learned institutions, and one of the first fellows of the royal society of Edinburgh, to whose *Transactions* he contributed various papers. In 1798 his son, Dr. Alexander Monro, *tertius*, was conjoined with him in the professorship; and in 1808 he finally retired from the anatomical chair, and from his extensive practice. He died Oct. 2, 1817, in his 87th year.

MONRO, ALEXANDER, *Tertius*, anatomical professor, son of Dr. Alexander Monro, *secundus*, born at Edinburgh, Nov. 5, 1773, was educated at the high school and university of that city, and studied medicine, anatomy, and surgery in London. In 1798 he became joint professor of anatomy with his father, and the following year he took his degree of M.D. In 1803 he instituted the class of practical anatomy in the university of Edinburgh, and in 1808 he succeeded his father in the anatomical chair. In 1828 he was president of the Royal College of Physicians of Edinburgh, and he contributed many valuable papers to its *Transactions*. He was also a fellow of the Royal Society of Edinburgh. He retired from his chair in 1847, with the title of emeritus professor of anatomy; and thus ended the connection between the college of Edinburgh and the family of Monro, which lasted for more than a century and a quarter. He died at his seat of Craiglockart, near Edinburgh, Mar. 10, 1859. He was the author of *Observations on Crural Hernia*, plates (Edin. 1803); *The Morbid Anatomy of the Gullet, Stomach, and Intestines*, plates (Edin. 1811); *Outlines of the Anatomy of the Human Body* (4 vols. 8vo, Edin. 1813); and other professional works.

MONROE, a co. in s.w Alabama, n.e. of the Alabama river; 990 sq.m.; pop. '90, 18,990, chiefly of American birth. The surface is diversified, and much of it covered with a growth of pine. The soil is fertile, and well adapted to the raising of Indian corn, which is the principal crop. Next in importance are sweet potatoes and cotton. Considerable quantities of molasses are manufactured from the cane. It is drained by the Alabama river and Limestone creek. Co. seat, Monroeville.

MONROE, a co. in e. Arkansas, n.e. of the White river, 696 sq.m.; pop. '90, 15,336, inclu. colored. The surface is even, and a large portion of it is cypress swamps. There are extensive forests of hickory, sassafras, and white oak. The soil is fertile, and produces good crops of Indian corn and cotton. Co. seat, Clarendon.

MONROE, the most southerly co. of Fla., included up to 1887 what is now Lee co. It is partly on the peninsula, touching Ponce de Leon bay on the west, and Florida bay on the south, and includes most of the "keys" and the Ten Thousand Islands. Area (land and water), 692 square miles; pop. '90, 18,786. The mainland is flat, and much of it is marshy. The north and west parts are available as cattle ranges. Co. seat, Key West.

MONROE, a co. in central Georgia, w. of the Ocmulgee, drained by Tobesofka, Towaliga, and Echeconnee creeks, on the Central railroad of Georgia; 490 sq.m.; pop. '90, 19,137, inclu. colored. The surface is uneven and hilly and the soil generally fertile. Granite, gold, and iron are found. The principal productions are cotton, Indian corn, wheat, oats, and sweet potatoes. Co. seat, Forsyth.

MONROE, a co. in s.w. Illinois, between the Mississippi and Kaskaskia rivers; 380 sq.m.; pop. '90, 12,948. The surface is somewhat uneven. The soil is fertile and produces large quantities of wheat, Indian corn, oats, and potatoes. There are a num-

ber of flour mills and harness manufactories. The Mobile and Ohio railroad passes through it. Co. seat, Waterloo.

MONROE, a co. in s.w. Indiana; area, 430 sq. m.; pop. '90, 17,673, chiefly of American birth, includ. colored. It is drained by the White river and its tributaries. The surface is uneven, soil fertile, and the principal crops grown are corn, wheat, oats, potatoes and tobacco. There are a number of saw and flour mills, woolen mills, currying shops and tanneries. It is on the line of the Louisville, New Albany and Chicago railroad. Co. seat, Bloomington.

MONROE, a co. in s. Iowa; 432 sq. m.; pop. '90, 13,660, chiefly of American birth. It is well watered by a number of small streams and creeks. It is largely prairie, with an undulating surface, uneven in some portions. The soil is fertile, and grows large crops of Indian corn. Next in amount are the productions of wheat, oats, butter, hay, and potatoes. There are some saw mills, flour mills, and a few smaller manufacturing establishments. It is intersected by the Burlington route and Iowa Central railroads. Co. seat, Albia.

MONROE, a co. in s. Kentucky, adjoining Tennessee; 272 sq. m.; pop. '90, 10,989, includ. colored. The surface is uneven. The soil is fertile, and grows, besides tobacco and corn, which are the chief productions, oats, potatoes, and sweet potatoes in considerable quantities. It is watered by the Cumberland river and the source of the Big Barren. Co. seat, Tompkinsville.

MONROE, a co. in s.e. Michigan, along the shores of lake Erie, adjoining Ohio; 530 sq. m.; pop. '90, 32,337. The Huron river flows along its n.e. side. It is watered by the Raisin river, which passes through a fertile valley, with fine scenery. The most important productions are Indian corn, wheat, oats, wool, potatoes, butter, and hay. There are a number of saw mills, carriage manufactories, and tanneries. There are also flour mills, brick-yards, and manufactories of agricultural tools. The Flint and Père Marquette, the Lake Shore and Michigan Southern, the Michigan Central and other railroads pass through it. Co. seat, Monroe.

MONROE, a co. in n.e. Mississippi, having the state line of Alabama for its e. boundary, and a branch of the Tombigbee river for its s.w., is drained by that river, intersecting it centrally, and traversed by the Mobile and Ohio, the Illinois Central and other railroads; 770 sq. m.; pop. '90, 30,730. Its surface is generally level, in some localities low and swampy, in others covered with dense forests of hard wood, interspersed with groves of magnolia, tulip tree, beech and elm. Its soil is a calcareous loam, very fertile, and adapted to the raising of live stock and the production of wheat, corn, sweet potatoes, cotton, and dairy products. Co. seat, Aberdeen.

MONROE, a co. in n. e. Missouri; 644 sq. m.; pop. '90, 20,790. It is well watered by the Salt river and its tributaries. It is principally a fertile, rolling prairie. Great crops of corn are grown, and wheat, oats, butter, hay, tobacco, and wool are raised in quantities. Rich veins of coal, limestone, and freestone are found. Agriculture is the principal business, and manufacturing has not been much developed. It is on the Missouri, Kansas and Texas railroad. Co. seat, Paris.

MONROE, a co. in w. New York, having lake Ontario for its n. boundary; 721 sq.m.; pop. '90, 189,586. It is drained by the Genesee river, the Irondequoit, the Honeoye, and other small streams. It is intersected centrally by the Erie canal, crossing the Genesee river, and by the New York Central and Hudson river, the Rome, Watertown and Ogdensburg, the Erie, the Lehigh Valley, the West Shore, the Rochester and Lake Ontario, and several other railroads. Its surface is generally level, sloping towards the water, and well wooded. Its orchard products are very considerable, and fruit and ornamental trees, apples, and wool are among its exports. Iron is mined; other mineral deposits are: Medina sandstone, Silurian limestone, gypsum, and water-lime. Its domestic trade is important, and its commercial facilities render its foreign commerce of great value. Its unlimited water power is utilized by factories, and among its vast industries are the manufacture of ready-made clothing, boots and shoes, cigars, hats and caps, steam-engines, bank locks, machinery, etc. At its county seat are the Leighton iron bridge works; and its flour mills grind millions of bushels of wheat annually. Co. seat, Rochester.

MONROE, a co. in s.e. Ohio, on the Ohio river; 468 sq. m.; pop. '90, 25,175, of American birth. The surface is uneven, heavily wooded, and contains deposits of coal. Iron is found in some parts. The soil is fertile, and the chief staples are tobacco and corn. The productions next in importance are oats, wheat, potatoes, hay, butter, and wool. Large quantities of cheese are manufactured. There are saw and planing mills, tanneries and currying shops, furniture factories and flour mills. Co. seat, Woodsfield.

MONROE, a co. in e. Pennsylvania, having the Delaware river for its s.e. boundary, separating it from New Jersey, a range of the Blue mountains for its s., and the Lehigh river for its n.w. boundary; about 625 sq. m.; pop. '90, 20,111. It is intersected by the Delaware, Lackawanna and Western, and the New York, Susquehanna, and Western railroads. Its fertile valleys are interspersed with elevations in some localities, and

diversified by forests of hickory, walnut, etc. It is drained by Brodhead's and Tobyhanna creeks; limestone and slate are quarried. It contains the charming summer resort of Delaware Water Gap, where the Delaware river breaks through the Blue Ridge through a gorge two or three miles long, whose sides rise 1400 feet above the level of the water. The surrounding country is noted for its picturesque scenery. Co. seat, Stroudsburg

MONROE, a co. in s.e. Tennessee, next to North Carolina; 580 sq.m.; pop. '90, 15,329, inclu. colored. The surface is uneven and hilly, and the soil generally fertile in the valleys. Portions are heavily wooded. Wheat, oats, pork, and Indian corn are the chief products. It is on one of the branches of the Southern railroad. Co. seat, Madisonville.

MONROE, a co. in s.e. West Virginia, having for its s. and s.e. boundary a ridge of the Alleghany mountains, the Kanawha river crossing its extreme n. section and a portion of its s.w.; 460 sq.m.; pop. '90, 12,429, chiefly of American birth, with colored. It is intersected by the Chesapeake and Ohio railroad. It is largely covered with forests of hardwood diversified by groves of sugar-maple. The soil is very fertile, and is highly esteemed for its good pasturage and facilities for stock raising. Both red and white sulphur springs are found in the south. Co. seat, Union.

MONROE, a co. in s.w. Wisconsin; 900 sq.m.; pop. '90, 23,211. The surface is rolling and irregular. The soil is fertile, producing, in large quantities, corn, wheat, oats, potatoes, and hay. Large amounts of wool and butter are made. Co. seat, Sparta.

MONROE, city and co. seat of Monroe co. Mich.; on the Raisin river, and the Ann Arbor, the Flint and Père Marquette, the Lake Shore and Michigan Southern, and the Michigan Central railroads; 40 miles s. w. of Detroit. It was settled under the name of Frenchtown by French from Detroit in 1784, and received American settlers about 1793. The battle of the river Raisin, between English and Indians and an American force in 1813, was followed by the massacre of several hundred American prisoners. The city has a fine harbor, public park, public library, St. Mary's academy (R. C.), high school, national and other banks, electric lights, and several weekly newspapers. Monroe is an important depot for grain shipment, and also exports glass-sand. The chief industries are woolen, lumber, paper, grist, and plaster mills, foundries and machine shops, tanneries, extensive nurseries, etc. Pop. '90, 5258.

MONROE, James, fifth president of the United States, was b. in Westmoreland co., Virginia, April 28, 1758. He was descended from a Captain Monroe of the army of Charles I., who emigrated to Virginia in 1652. He entered William and Mary College, but on the breaking out of the revolutionary war, left, at the age of eighteen, to join the army under Washington. Before long he was commissioned lieutenant, and during the battle of Trenton captured a British battery. He was promoted to a captaincy; then as aide-de-camp to Lord Stirling, a position which debarred him from entering the army as a commissioned officer. He took up the study of law under Thomas Jefferson, and when the British invaded the Carolinas, he was sent as military commissioner to the army in South Carolina. In 1782 he was elected from King George's county to the legislature of Virginia and appointed a member of its executive council. In 1783 he was chosen a delegate to Congress, and while a member of that body was prominent in the movement to give Congress power to regulate trade between the states, and was foremost in denouncing the claim of Spain to the right of navigation on the Mississippi. In 1785 he married a Miss Kortright, of New York, and settled in Fredericksburg, Va. He re-entered the state assembly in 1787, and in 1788 was a delegate to the convention to decide on the adoption of the federal constitution, opposing its ratification, because he feared the power and encroachment of the federal government. He was afterwards sent by Washington as minister to France, and was received with singular enthusiasm by the revolutionary government. He was, however, soon recalled, for having too decided French sympathies. In 1799 he was elected governor of Virginia; and in 1803 sent by Jefferson as minister to France, to purchase Louisiana, which vast territory he secured for 15,000,000 dollars. He was now employed for several years in diplomacy in England and Spain. On the election of Mr. Madison to the presidency, he was made secretary of state, and also performed the duties of secretary of war. In 1816 his eminent services were rewarded by his being elected president of the United States by the democratic-republican party, and he made himself very popular. The acquisition of Florida from Spain, and the settlement of the vexed question respecting the extension of slavery by the Missouri compromise, by which, after the reception of Missouri as a slave state, the institution was prohibited above the line of latitude 36° 30′, helped to secure his re-election in 1820. His most popular acts, perhaps, were the recognition of the independence of Mexico and the South American republics, and the promulgation of what has since been called the "Monroe doctrine," in which he declared the American policy of "neither entangling ourselves in the broils of Europe, nor suffering the powers of the old world to interfere with the affairs of the new," and that "any attempt to extend their system to any portion of this hemisphere would be dangerous to our peace and safety." In 1825 he retired to his seat at Oak Hill, Loudon co., Virginia; but he still

continued in the public service. After being twice president, he acted as justice of the peace, a visitor of the university of Virginia, and member of a state convention; but a profuse generosity and hospitality caused him to be overwhelmed with debt, and he found refuge with his relations in New York, where he died in 1831—like his predecessors, Adams and Jefferson, on July 4. He was an honorable and able statesman, though not a speaker or a man of brilliant talents.

MONROE DOCTRINE, a scheme of public policy, named after its author, James Monroe, fifth president of the United States of America, by whom it was enunciated in his message to congress, Dec. 2, 1823. Mr. Monroe set forth in his message that "as a principle, the American continents, by the free and independent position which they have assumed and maintained, are henceforth not to be considered as subjects for future colonization by any European power;" and that any attempt on the part of the European powers to "extend their system to any portion of this hemisphere" would be regarded by the United States as "dangerous to our peace and safety," and would be opposed accordingly.

MONS (Flem. *Berghen*), an important t. of Belgium (formerly fortified), capital of the province of Hainaut, on the Trouille, 38 m. s.s.w. of Brussels. Its fortifications were renewed and strengthened since 1818, but in 1866, in accordance with the new arrangement for the defense of the country, they were demolished. The immediate vicinity can be laid under water by altering the course of the Trouille. The *canal de Condé* connects the town with the Scheldt, and there is communication by railway with Brussels, Valenciennes, Charleroi, etc. Its principal architectural ornament is the cathedral of St. Waudru, dating from the 15th and 16th centuries—a masterpiece of Gothic. The chief manufactures are linen, lace, earthenware, tobacco, chocolate, oils, pins and porcelain. The vicinity forms an extensive coalfield, with about 400 pits. A large trade is carried on in coals, flax, hemp, horses and cattle. Pop. (comm.) '90, 25,800.

Mons, supposed to occupy the site of a Roman station, was made the capital of Hainault by Charlemagne in 804. During the 17th and 18th centuries, it was frequently the object of contest between France and Austria.

MONSEIGNEUR, a French title, compounded of the words *mon* and *seigneur*, meaning my lord, applicable to royal or imperial princes, cardinals, archbishops and bishops of France, and accorded in courtesy to the high officers of government, and persons generally of high rank. Its plural is *messeigneurs*. Abbreviations *mgr., mgrs.* The title was not applied to bishops until about the close of the 17th c., when they acquired it by concerted action in addressing each other in that way. Their title previously was simply *monsieur*. A law of the French convention in 1801 interdicted the use of the title to bishops and archbishops, and required them to confine their signature, titles, and their addresses to each other to the words *citoyen* or *monsieur*. In the language of French thieves *monseigneur* is applied to a tool used to break locks.

MONSERRAT. See MONTSERRAT.

MONSIEUR, plural *messieurs*, a French title formerly addressed to persons of medium rank, and corresponding to sir or my sir in English; now universally employed in French by all gentlemen in addressing each other. It is also used as a prefix to titles of rank, as *monsieur le prince, messieurs les députés, monsieur le préfet;* and as a form of respect in mentioning a third person without regard to rank, as *monsieur votre frère, monsieur votre voisin*, etc. In the middle ages the title was given to saints, as *monsieur saint Pierre, monsieur saint Jean*, etc., and also in the same manner applied as a prefix to the names of popes and of members of the royal family when alluded to in the third person. It was the special title of the oldest brother of the French king, the duke of Orleans, who was specifically indicated when one spoke simply of *monsieur*.

MONSIEUR DE PARIS. The euphemistic name popularly given in France to the public executioner. See JACK KETCH.

MONSON, a town in Hampden co., Mass.; on the Chicopee river and the Central Vermont railroad; 17 miles e. of Springfield. It was incorporated in 1760; contains the villages of Monson Central, North Monson, South Monson, and Quarry; and has the state hospital for epileptics, an academy of high repute, a public library, national and savings banks, granite quarries, a weekly newspaper, and manufactories of woolen goods, and straw hats and bonnets. Pop. '90, 3,650.

MONSON, SIR EDMUND JOHN, British diplomatist, was b. Oct. 6, 1834, was educated at Eton and Balliol college, Oxford. Has held diplomatic positions under the British government at Paris, Florence, Washington, Brussels, was consul-general to Hungary (1871), was made a C.B. in 1878, has been ambassador extraordinary and plenipotentiary to Austria 1893 and to France 1897.

MONSOON (Malayan, *musim*) is derived from the Arabic word *mausim*, a set time or season of the year, and is applied to those winds prevailing in the Indian ocean which blow from the s.w. from April to October, and from the opposite direction, or n.e., from October to April. The existence of these winds was made known to the Greeks during the Indian expeditions of Alexander, and by this knowledge, Hippalus was emboldened to sail across the open sea to Muzeris, the emporium of Malabar. The monsoons depend, in common with all winds, whether regular or irregular, on the inequality of heat at dif-

ferent places and the earth's rotation on its axis ; but more particularly they are occasioned by the same circumstances which produce the trade winds and the land and sea breezes, being, in fact, the combined effect of these two sets of causes.

If the equatorial regions of the earth were entirely covered with water, the trade-winds (q. v. under WIND) would blow constantly from the n.e. in the n., and from the s.e. in the s. of the torrid zone, with a belt of variable winds and calms interposed; the whole system, following the sun's course, moving northward from December to June, and southward from June to December. But, especially in the eastern hemisphere, large tracts of land stretch into the tropics, and give rise to the extensive atmospheric disturbances for which those parts of the earth are so remarkable. During the summer half of the year, the n. of Africa and the s. of Asia are heated to a higher degree than the Indian ocean, while Australia and South Africa are much colder. As the heated air of southern Asia expands and rises, and the colder air from the s. flows in to supply its place, a general movement of the atmosphere of the Indian ocean sets in towards the n., thus giving a *southerly* direction to the wind; but as the air comes from those parts of the globe which revolve quicker to those which revolve more slowly, an easterly direction will be communicated to the wind; and the combination of these two directions results in the s.w. monsoon, which prevails there in summer. Since, during winter, South Asia is colder than the Indian ocean, which, again, in its turn, is colder than South Africa, a general motion of the atmosphere sets in towards the s. and west. As this is in the same direction as the ordinary trade-wind, the effect in winter is not to change the direction, but only to increase the velocity of the trade-wind. Thus, while s. of the equator, owing to the absence of sufficiently large tracts of land, the s.e. trade-winds prevail throughout the year; on the n. of the equator we find the s.w. monsoon in summer, and the n.e. in winter; it being only in summer and n. of the equator that great changes are effected in the direction of the trade-wind.

Similar though less strongly-marked monsoons prevail off the coasts of Upper Guinea in Africa, and Mexico in America. The e. and w. direction of the shores of these countries, or the large heated surfaces to the n. of the seas which wash their coasts, produce, precisely as in the case of South Asia, a s.w. monsoon in summer. As might have been expected, the monsoon off the coast of Mozambique is easterly, and that off the coast of West Australia north-westerly. The trade-winds also suffer considerable change in their direction on the coasts of Brazil, Peru, Lower Guinea, etc. These, though sometimes considered monsoons, are not truly such, for they do not change their directions periodically, so as to be opposite to each other, like true monsoons, but only veer through a few points of the compass. For a fuller account of these partial deflections, see WIND.

In April, the n.e. monsoon changes into the s.w.; and in October, the s.w. into the n.e. These times depending on the course of the sun, and consequently varying with the latitude, are called the breaking up of the monsoons, and are generally accompanied by variable winds, by intervals of calm, and by furious tempests and hurricanes.

Monsoons, when compared with the trade-winds, will be found to play a most beneficial and important part in the economy of the globe. Their greater velocity, and the periodical changes which take place in their direction, secure increased facility of commercial intercourse between different countries. But the full benefits following in their train are not seen unless they be considered in their relation to the rain-fall of southern Asia. Indeed, the fertility of the greater part of this fine region is entirely due to the monsoons; for if the n.e. trade-wind had prevailed there throughout the year, central and western India, and many other places, would only have been scorched and barren saharas. The rain-fall of India depends entirely on the monsoons. The coast of Malabar has its rainy season during the s.w. monsoon, which brings thither the vapors of the ocean. On the Coromandel coast, on the other hand, it is the n.e. monsoon which brings the rain from the bay of Bengal. The two coasts of Hindustan have therefore their seasons reversed, the dry season of the one corresponding with the wet season of the other.

MONSTER. See MONSTROSITY, in anatomy.

MONSTRANCE (Lat. *monstrare*, to show), called also OSTENSORY, the sacred utensil employed in the Roman Catholic church for the purpose of presenting the consecrated host for the adoration of the people, as well while it is carried in procession, as when it is exposed upon the altar on occasions of special solemnity and prayer. The use of the monstrance probably dates from the establishment of the festival of Corpus Christi in the 13th century. It consists of two parts, the foot or stand upon which it rests, and the repository or case in which the host is exhibited. The latter contains a small semicircular holder called the *lunula*, or crescent, in which the host is fixed; and it appears anciently to have been of a cylindrical or tower-shaped form, in the central portion of which, consisting of a glass or crystal cylinder, the host was placed. At present it is more commonly in the form of a star or sun with rays, the central portion of which is of glass or crystal, and serves to permit the host to be seen. This portion, or at least the crescent, is of gold or of silver gilt; the rest is generally either of the precious metals, or at least gilt or silvered, although the lower portion is occasionally of bronze artistically wrought. In many cases it is of most costly materials and workmanship. The mon-

strance, like the other vessels used in the Eucharistic service, is consecrated by a bishop, or a priest deligated by a bishop. By a peculiar usage of the city of Lucerne, in Switzerland, the Eucharist is always carried in the monstrance, when being borne to the sick.

MONSTRELET, Enguerrand de, 1390–1453; a chronicler following immediately after Froissart, and with less charm of narration; the first clear, reasoning, and exact collector of the facts of the history of his time. In 1430 he had a civil and military function in Compeigne, and was afterwards present at the interview between Jean d'Arc and the duke of Burgogne. His chronicles of the 15th c. were republished in 7 vols., Paris, 1857.

MONSTROSITY, in anatomy. When an infant, or the young of any animal, comes into the world impressed with morbid changes, which occur only in fetal life, and of which it has never been observed that they have originated in the same way after birth, such an infant or young animal is said to be a monster or monstrosity. Monsters were formerly regarded as prodigies of nature; and in the dark ages their occurrence in the human species was usually ascribed to the intercourse of demons and witches. It is now perfectly understood that the formation of those apparently anomalous beings may be accounted for by the same laws as those which govern the formation of perfect individuals—the only difference being that these laws in the case of monstrosity are more or less arrested or otherwise perverted.

Amongst the principal causes of monstrosity may be mentioned: 1. Something deficient or abnormal in the generative matter of one or both parents, because, as has been shown in the article Hereditariness, malformations are frequently transmitted from parents to the children. Here the morbid change is impressed upon the fetus at the moment of impregnation. 2. Some morbid condition of the maternal organs or constitution may exercise a disturbing influence on development. 3. Diseases and abnormal states of the placenta, of the membranes of the ovum, and of the umbilical cord, may induce an arrest of development; for example, it may be easily understood how abnormal shortness of the cord may favor the origin of fissure of the abdomen; while a cord of disproportional length may coil round one of the extremities, and by constriction may dwarf it, or even amputate it. 4. Morbid influences acting directly on the fetus, as mechanical injuries and diseases affecting it, are the most frequent causes of malformations. From the experiments of several observers, it has been shown that by submitting hens' eggs to various mechanical influences during incubation, the development of the embryo may be interrupted, or modified in such a manner as to give rise to malformations; and many observations tend to prove that mechanical influences affecting the womb (kicks, blows, or falls) in the early months of pregnancy, produce certain malformations, by causing an arrest of development. Moreover, the fact that certain malformations usually occur only in twin or triplet pregnancies, favors the view that certain monstrosities are due to pressure and confined space.

Of the various classifications of monstrosities, the following is perhaps the best: 1. Malformations in which certain parts of the normal body are entirely absent, or are too small. 2. Malformations produced by fusion or coalescence of organs. 3. Malformations in which parts naturally united, as in the mesial line of the body, are separated, and clefts or fissures occur. 4. Malformations in which natural openings are closed. 5. Malformations of excess, or in which certain parts have attained a disproportional size. 6. Malformations in which one or more parts have an abnormal position. 7. Malformations of the generative organs.

The *first class* includes (1) completely shapeless malformations, in which the monster presents the appearance of a lump or mass, with no indication of definite organs; (2) malformations which consist of only a more or less rudimentary trunk, with no head or extremities; (3) trunkless monsters, in which the inferior parts of the body are wanting, and little more than a rudimentary head is present, which, instead of neck and trunk, is furnished with a pouch-like appendage, containing rudimentary viscera and pieces of bone; (4) malformations in which the head, and sometimes a part of the upper part of the body, are wanting, constituting acephalic monsters, which are by no means rare, the number of recorded cases in the human subject being over 100; (5) malformations in which the whole head is not absent, but some of its component parts are wanting—as, for example, the brain, some of the cranial bones, the nose, or the eyes; (6) cases in which the extremities are absent or imperfect to a greater or less degree—for example, they may be mere stumps, with the fingers and toes either absent or rudimentary, or the hands and feet may appear to exist independently of arms and legs, and to be inserted immediately into the trunk; (7) cases in which all the organs may be present, but some of them may be too small—thus, there may be general dwarfishness, or the head or limbs may be abnormally small. None of the monsters of this class, except those included in the last two groups, are viable.

In the *second class* are included such cases as (1) the various forms of *cyclopia*, or coalescence of the eyes; these malformations are not very rare in the human subject, and are of frequent occurrence in pigs and other animals; although usually born alive, these monsters are not viable; (2) coalescence of the lower extremities either into a common limb, which supports two feet, or into an undefined tail-like mass; (3) minor amal-

gamations, which do not affect vitality, as more or less perfect coalescence of the fingers and toes.

The *third class* embraces such cases as (1) fissures of the cranium, which are generally due to hydrocephalus in the fetus; (2) harelip and cleft palet; (3) fissures on the neck, whose origin is due to the respiratory clefts—which, during the formation of the embryo, appear in the cervical region, not uniting at an early stage, as in the normal condition, but remaining more or less open; (4) fissures of the vertebral arches of the spinal column, occasioning the affection known as *spina bifida;* (5) fissures of the thorax, in which case the lungs or heart are more or less exposed; (6) fissures of the abdomen.

The malformations of the *fourth class* include congenital closure of the anus, the mouth, the nostrils, etc.

The malformations of the *fifth class* may be arranged in two divisions, according as certain parts are too large, or there are supernumerary organs.

The *sixth class* is very extensive, and embraces many varieties. One or more parts may be disproportionately large—as, for example, the head in cases of congenital hydrocephalus; or there may be one or several supernumerary organs—a sub-class which presents a very great range, from the simplest cases, in which a single joint of a finger is supernumerary, to those of a highly complicated nature, when two or even three bodies are united by some one point. There may be a single head and trunk and supernumerary parts—as, for example, supernumerary teeth, vertebræ (giving rise to the formation of a tail in the human subject), ribs, mammæ, fingers, toes, etc.; or there may be malformations with more than one head and trunk—double, or even triplet monsters. This sub-class is divisible into two groups, according as the united individuals are equally developed, or as only one is developed; the second being more or less atrophied, and forming a parasitic appendage to the first. As examples of the first group, we mention (1) duplication of the head and upper part of the vertebral column; (2) duplication of the head, neck, and upper extremities, while the chest and abdomen are single, or fused into one another (in this group, we must place the twin-monster Rita Christina, who was born in Sardinia in Mar., 1829, and was brought alive to Paris, where she died in the November of that year); (3) almost complete duplication, with separation of the two bodies, except at a single spot, as in the case of the Siamese twins; (4) triplet monsters, such as the child with three heads born in 1832 in Catania (see Geoffroy St. Hilaire, *Histoire des Anomalies de l'Organisation,* vol. iii. p. 327). To the second group belong such cases as the following: (1) a perfect individual may bear on its head another head, with traces of the rest of the body; (2) on a well-developed body, a second, smaller and defective one, may be situated, which, after birth, does not increase in size; (3) in a more or less perfectly developed individual, there may be concealed, commonly in the abdomen, parts of a second individual—a condition which has received the name of *fœtus in fœtu,* and which is most probably caused by the inclusion of one germ by another.

To the *sixth class* belong (1) those cases in which there is a reversing of the position of the internal organs—when the heart and spleen lie upon the right, and the liver and cæcum on the left side; (2) anomalies in the course and distribution of individual vessels.

The malformations constituting the *seventh class* have been sufficiently noticed in the article Hermaphroditism.

The term *teratology* (from the Greek words *tĕras,* a prodigy, and *lŏgos,* a discourse) is now frequently applied to the history and science of monstrosities. For further information on this subject, the reader is referred to Geoffroy St. Hilaire, *Histoire des Anomalies de l'Organisation* (3 vols. 1832–36); Otto, *Monstrorum Sexcentorum Descriptio Anatomica* (1841); and to the article "Teratology," by Vrolik, in *The Cyclopædia of Anatomy and Physiology.*

MONSTROSITY, in botany, is a malformation or abnormal development of any part of a plant. It may take place, however, at any period of the growth of a plant, as to any new organ that is developed, and sometimes merely affects a particular organ or some portion of a plant, as a particular leaf, flower, petal, sepal, etc., or the leaves or flowers of a particular branch, while in other cases all the organs of the same kind exhibit the same abnormal character. As in animals, it is now well known that monstrosities in plants are the result of special conditions affecting the operation of ordinary natural laws; and the study of monstrosities is very important in relation to that of the nature, development, and metamorphosis of organs. In the article Metamorphosis of Organs, some of the most frequent monstrosities are alluded to. Monstrosities in plants are not always, as in animals, reckoned deformities. *Double flowers* afford a familiar example of an opposite kind; although with regard to the plant itself they have the effect of unfitting it for one of the functions of a perfect plant, reproduction by seed.

MONTAGNA'NA, a t. of northern Italy, in the province of Venetia, situated pleasantly on the banks of a canal, Il Fiumicello, 22 m. w.s.w. of Padua. It is still protected by walls and towers, and has a fine cathedral and palace. Pop. 3000. Its chief trade is in spun-silk, wool, hemp, and coarse cotton textures.

MONTAGNARDS, or simply Montagne, "the Mountain," the name given to the extreme democratic politicians in the first French revolution, because they seated themselves on the higher benches of the hall in which the *national convention* met. Their

principal members were Danton, Marat, Robespierre, St. Just, and Collot d'Herbois, the men who introduced the "reign of terror." The opposite party of the "plain" (*plaine*) were the Girondists (q.v.), who sat on the lowest benches on the floor of the house. After the overthrow of the Girondists, this part of the house was styled the "marsh or swamp" (*marais*), and included all the subservient members whose votes were under the control of "the Mountain." A few leading men gave all its strength and formidable character to the party of the Mountain. After 1848, the extreme party in the *national assembly*, composed of revolutionary democrats and communists, sometimes flattered itself with the designation of "the Mountain;" but events proved that it possessed nothing of the genius, though it showed all the malignity of its terrible predecessor.

MONTAGU, Family of. This noble family are said, by Burke, to derive their name, which in Latin was and is always written De Monte Acuto, from a place in Normandy; and the first of the Montagus who settled in England was a warrior who came over in the train of Robert earl of Moreton at the conquest. Five centuries later, we find his descendant, sir Edward Montagu, lord chief-justice, in succession, of the courts of king's bench and common pleas under Henry VIII., who also appointed him one of the executors of his will and guardians of his son Edward. His grandson, who was a distinguished orator, represented the city of London in Parliament; and having been lord chief-justice of the court of king's bench, and lord treasurer of the kingdom, was raised to the peerage as earl of Manchester. The second earl gained distinction as a general in the parliamentary army, and more particularly by his victory over Prince Rupert at Marston Moor; but he scrupled to take part in the condemnation and execution of Charles, and was one of the first members of the house of peers who gave in his adhesion to Charles II. on his restoration. This nobleman's grandson enthusiastically espoused the cause of William III., under whom he fought at the battle of the Boyne, and took part in the siege of Limerick. He was subsequently sent as ambassador to Venice and to the courts of France and Vienna, and eventually was raised to the dukedom of Manchester by George I. The title is still enjoyed by his descendant, the 7th duke. Other branches of the Montagu family were ennobled in the persons of the earl of Sandwich, the earl of Halifax, and the duke of Montagu, but the last two titles both became extinct before the close of the 18th century.

MONTAGU, Basil, 1770–1851; b. London. He was the son of John Montagu, fourth earl of Sandwich, and of Miss Ray, who was shot in 1779 in the piazza of Covent garden by the Rev. James Hackman in a fit of jealous frenzy. He received his early education at the Charter House school in London, and took the degree of M.A. at Cambridge in 1790, distinguishing himself by his love of literature; entered Gray's Inn, and was admitted to the bar in 1798. While in London he became intimate with Coleridge, and adopting the opinions of Godwin, determined to abandon the law, but was dissuaded by sir James Mackintosh. He was a copious and able writer. The most important of his works is a *Digest of the Bankrupt Laws*, in 4 vols., for which he obtained in 1806 the office of commissioner of bankruptcy. This became a standard work and passed through many editions. Hs was distinguished for his efforts to mitigate the severity of the penal code. He wrote several pamphlets on capital punishment, and with Wilberforce, Romilly, and others succeeded in obtaining the abolition of hanging for forgery. He edited Bacon's works in 16 vols. He published 40 vols., and left 100 more in manuscript.

MONTAGU, Edward Wortley, 1713–76; b. Wharncliffe, Yorkshire, Eng., only son of Edward Wortley and Lady Mary. When very young he ran away from Westminster School repeatedly, gave himself up to the lowest vices, and hired himself out as a cabin boy in a ship sailing for Spain, where he was discovered by the British consul at Cadiz, and restored to his family. He was then committed to the charge of a private tutor who obtained for him an appointment to a public office. He was then sent to travel on the continent under the care of the tutor, and while abroad he published his first work, *Reflections on the Rise and Fall of Ancient Republics.* While at Paris he became involved in an altercation with a Jew which led to a criminal prosecution. On his return to England he married, while still under age, a woman much older than himself, and in a few weeks deserted her. Notwithstanding his profligacy he obtained a seat in parliament in 1747, and was re-elected, until being involved in debt by his extravagance he was forced to resign. He again went abroad, never returning to England. He proceeded first to Italy, became a Roman Catholic, and then went to Egypt, where he turned Mohammedan. He spent the remainder of his life in the Levant, having been in the mean time disinherited by his parents, but was on his way back to England when he died at Padua. Besides the tract before mentioned he wrote another, entitled *An Examination into the Cause of Earthquakes*, and contributed some papers to the *Philosophical Transactions.* His tract on *Ancient Republics* was claimed as the production of Mr. Foster, his tutor.

MONTAGU, Elizabeth Robinson, 1720–1800; b. York, Eng.; was married in 1742 to Edward Montagu, grandson of the first earl of Sandwich, who on his death left her a large fortune. With abundance of wealth, and possessing literary talent, she became a leader in London society, and her residence was the favorite resort of literary persons. For several years she gave annual dinners on May-day to the chimney-sweeps

of London. She wrote three *Dialogues of the Dead*, published in Lord Lyttleton's work by that name, and an *Essay on the Writings and Genius of Shakespeare, compared with the Greek and French Dramatic Poets*. She is well known by her correspondence in 4 vols. See Doran's "*A Lady of the Last Century*" (1872).

MONTAGU, Lady Mary Wortley, was eldest daughter of Evelyn, earl, and afterwards (1715) duke of Kingston. She was born about 1690, and is said to have received a classical education. When only eight years of age she was introduced by her father to the famous *Kit-Cat club*, and formally admitted a member. Her fond pleasure-loving father allowed her to educate herself. She is even said to have taught herself Latin. She became attached to Mr. E. Wortley Montagu, a member of the house of commons, whose cousin, Charles Montagu, was created earl of Halifax, and appointed first lord of the treasury, by George I. As the match was disapproved of by the families, she was obliged to elope before she could marry him. On the accession of George I. she came to London with her husband, who was a whig. Lady Mary's beauty and wit attracted universal admiration at court. She was in habits of familiar acquaintance with Addison and Pope, the latter becoming her enthusiastic admirer, and writing "flames and raptures" for her, until his passion "came to a climax in an impertinence, and was extinguished by a box on the ear, or some such rebuff." In 1716 Mr. Wortley Montagu was appointed ambassador to Constantinople. He was accompanied by lady Mary, who, on her journey, and during her residence in the Levant, wrote the well-known *Letters*, which form one of the most delightful books in our language. The weaknesses of a somewhat vain and capricious temper fade into forgetfulness, when we remember the strong sense, enlightened courage, and generous perseverance which introduced into Europe the practice of inoculation, which she witnessed in Turkey. She had so much faith in its safety, that she tried it first on her own son. See Inoculation. After her return to England she fixed her residence at Twickenham, and renewed her intimacy with Pope. But political soon led to personal differences, and these resulted in one of the most famous literary feuds of the 18th century. The immediate occasion of it was the publication by Lady Mary of her *Town Eclogues*. She was fiercely assailed by both Swift and Pope, and was not slow to retaliate. In 1739 she left her country and her husband (for reasons that are not known), and lived for many years in Italy, chiefly at Lovero, in the province of Venice. Her husband died in 1761. At the request of her daughter, afterwards wife of the earl of Bute, she returned to England, where she died 21 Aug., 1762. An edition of her works, with life, was published by her great-grandson, the late Lord Wharncliffe, in 1836; third edition, 1887.

MONTAGUE, a co. in n. Texas, bounded on the n. by the Red River, which separates it from the Indian territory, and drained by the Denton fork of the Trinity River. 890 sq.m.; pop. '90, 18,863, of American birth. Co. seat, Montague.

MONTAGUE, a town in Franklin co., Mass.; on the Fitchburg and the Central Vermont railroads; 8 miles s.e. of Greenfield. It was incorporated in 1754; contains the villages of Montague Centre, Turners Falls, Lake Pleasant, Montague City, and Millers Falls; and has the Montague and Turners Falls public libraries, a high school, electric light and street railroad plants, and manufactories of cotton goods, paper, wood pulp, cutlery, bricks, and fishing rods. Pop. '90, 6296.

MONTAJONE, a t. in n. Italy, near the sea, about 25 m. s.w. of Florence, having mineral springs celebrated for their medicinal properties; pop., 10,556.

MONTAIGNE, Michel Eyquem de, a distinguished French moral philosopher, was b. in 1533, at his paternal home of Montaigne, in Perigord. In accordance with his father's eccentric ideas on education, he was taught, and suffered only to speak Latin from his earliest infancy, in consequence of which he acquired such a perfect mastery over the language, that when, in his tenth year, he entered the college of Bordeaux, his masters, Grouchi, Buchanan, and Muret, were almost afraid to address him. On the expiration of his course of studies, which were directed to law, he received, in 1554, the appointment of councilor in the parliament of Bordeaux; but being possessed of ample means, and having no inclination for a public life, he devoted himself to the study of the various schools of Greek and Roman philosophy; and on the death of his father, in compliance with whose wish he had made a translation of the natural theology of Raymundus Sebondus (Paris, 1569), he retired to his ancestral estate, where he lived in retirement during the terrible season of religious oppression which desolated France for so many years. During this period, 1580, he composed the first two books of his celebrated *Essais*, the third portion of which appeared in 1588, after his return from an extensive course of travels, which he had undertaken partly to escape from the plague, and partly for the improvement of his own health, and during which he visited Rome, and was received with signal favor by the pope. Montaigne's *Essais*, although not conceived in the spirit of a believing Christian, or marked by the reticence and delicacy of expression which modern refinement demands, are very extraordinary productions, not only for the learning and sound reasoning which they manifest, but also for the frank and liberal tone in which social questions are discussed, notwithstanding that the author wrote at a period when religious differences and party feelings blinded the judgments of men. Montaigne's ethics were those of Seneca and the other philosophers of ancient times, whose works he had so thoroughly mastered; and, judged from our point of view, his morality is that of a virtuous pagan merely; but when we bear in mind the turmoil of civil war, and the

consequent disorganization of society, together with the low ebb of literature in France at that period, we must do justice to the great merit of the writer, and the influences for good which his writings exerted. Montaigne was a constant, and occasionally a successful mediator between the party of Henry of Navarre and that of the Guises, and stood in relations of friendship with men of all creeds. He died in 1592 as an avowed member of the Church of Rome, in whose doctrines he professed implicit faith, notwithstanding the sceptical bias which he had through life been at no pains to conceal. Numerous editions have appeared of his *Essais*, among which we may instance those of De Coste (5 vols. Hag. 1727), and Victor Leclerc (Paris, 1826). Nearly 200 years after his death, the discovery was made at Montaigne of the MS. of his travels, which was was published at Paris in 1774 under the title of *Journal de Voyage de M. de M. en Italie par la Suisse et l'Allemagne.* Translations of the *Essais* exist in almost all the European languages; the best English translation is that by Cotton. The best biographies of Montaigne are by Grün (Paris, 1855); Payen (Paris, 1856); and Bayle St. John (Lond. 1857).

MONTALCI'NO, a t. in the province of Siena, Central Italy, 20 m. s.s.e. of the town of Siena, stands on a hill in the midst of valleys, and enjoys a fine equable climate. Pop. 3000. The wine of Montalcino is in high repute throughout Tuscany.

MONTALEMBERT, Charles Forbes de Tryon, Comte de, was b. in May, 1810, of an ancient family of Poitou. His father was created a peer of France, and for a considerable time was minister of the French court in Sweden. His mother was of the Scottish family of Forbes, to which circumstance may be ascribed Montalembert's remarkable familiarity with the English language, and his intimate knowledge and strong admiration of the social and political institutions of England. Although his more advanced studies were carried on in the university of Paris, a considerable part of his youth was spent in Sweden; and the first work by which he was brought into notice, was a pamphlet on Sweden, which he published in his nineteenth year. On the death of his father, Montalembert succeeded to his honors, and to his seat in the Chamber of Peers. But his earliest public appearance was in what may be truly considered as the great labor of his life, a joint effort in which he associated himself with the Abbé Lacordaire (q.v.) and other friends, for the purpose of taking advantage of the recent charter, by establishing a free school for Catholic education, independent, as well of the university, as of all other state influence. An attempt on the part of the police to interfere arbitrarily with this project, became the subject of a trial before the Chamber of Peers, which Montalembert rendered memorable by his first speech, one of the most brilliant upon record, and a clear foreshadowing, not alone of the eloquence, but of the bold and uncompromising earnestness in the cause of his church and of the common interests of religious liberty, which have constantly characterized his later career. Of the struggle of the Catholic party in France against what they regarded as the arbitrary monopoly of education which was claimed for the university, Montalembert was for many years the leader and champion; and in the various works in the preparation of which he employed all his leisure from public duties, his *Life of St. Elizabeth of Hungary*, his *Life and Times of St. Anselm*, and, above all, in an appeal *On the Duty of Catholics on the Question of Freedom of Education*, which he wrote during a visit to the island of Madeira for the recovery of his health in 1843, he never ceased to advocate the same principles. After the revolution of 1848, Montalembert, true to his former professions, was one of the first of his party to accept of the new state of things, and to use the actual means at his disposal for the furtherance of the views which he had consistently advocated. He was elected member of the national, and afterwards of the legislative assembly; and for a time contrived, while he continued the same line of policy as regards church interests, to give a general support to the government of Louis Napoleon as president of the republic. His first break with that government was on the question of the proposed confiscation of the Orleans property; and after the *coup d' état* of December, the breach became irreconcilable. From that time, Montalembert continued to be the implacable assailant of the arbitrary repression of public opinion which characterized some measures of Napoleon III.; and the brilliant and enthusiastically admiring pictures, which in his *Political Future of England*, he has drawn of its social and political institutions, derive much of their vigor from the covert but palpable contrast with the condition of France which points them all. Besides numerous articles contributed by him to the *Revue des Deux Mondes*, the *Encyclopédie Catholique*, and the *Correspondent*, he also wrote: *L'Avenir politique de l'Angleterre* (1855); *Les Moines d'Occident depuis St. Benoît jusqu' à St. Bernard* (1860—67); English translation, 5 vols. 1861—67); *Une Nation in deuil, la Pologne en* 1861; *L'Eglise libre dans l'Etat libre* (1863); *Le Pape et la Pologne* (1864), etc. He died Mar. 13, 1870. See Memoir by Mrs. Oliphant, 2 vols. (1872).

MONTALEMBERT, Marc René, Marquis de, 1714–1800; b. and educated in Angoulême; entered the army at the age of 18, and while engaged in military service made a specialty of scientific study, and in 1747 became a member of the Academy of Sciences of Paris. In 1751 he constructed foundries at Rouelle for cannon of larger caliber than previously used, which were employed in the seven years' war (1756–63), in which he was general in the service of Sweden and Russia. He aided Todleben in the capture of Berlin in 1760, and the following year had finished a great work on fortifications, which he was about to publish, when the French minister, Choiseul.

interdicted the publication in order to have it for the sole benefit of France. He became the chief military engineer of France, and his systems proved superior to all others. In 1779 he constructed a fort of wood on the *Isle d'Aix*, which was found to have wonderful resistance in proportion to its cost. At the beginning of the French revolution Mirabeau undertook to make him inspector-general of the fortifications of France, but his rank was a bar-sinister. In 1792 the French war office, under Carnot, purchased his collection of models, and he became the trusted adviser of that minister. He lived to see his inventions and theories, following in general the system of Vauban, adopted in France and throughout Europe, after many years of almost contemptuous opposition. His main work is *Fortification perpendiculaire*, 11 quarto vols., 1776–78; re-edited and published in 1793 under the title of *L'Art défensif superior a l'art à l'offensif*. He was author also of many memoirs on various subjects, of poems, and of comedies.

MONTALVAN, Juan Perez de, 1602–38, b. Madrid. He received instruction and assistance from the famous dramatic writer Lope de Vega, to whom he became greatly attached, and whom he adopted as his model in almost everything. Like his master, he entered the priesthood, and accepted an office in the inquisition. At the age of 30 he had written 36 dramas, and in 1636 the number had increased to 60. The construction was flimsy and the execution careless. One of his last works was an extravagant panegyric, in 1636, on his friend and instructor. His intense and incessant study had now begun to affect his brain, and he soon fell into a state of imbecility, which continued till his death. His collected dramatic works appeared in 1638–39, and were reprinted in 1652.

MONTANA, a. n. western state, between lat. 44° 6′ and 49° n.; long. 104° and 116° w.; bounded on the n. by Canada (Alberta and Assiniboia); on the e. by North and South Dakota; on the s. by Wyoming and Idaho, and on the w. by Idaho; av. length from e. to w., 470 m.; av. breadth, 275 m.; land area, 145,310 sq.m.; gross area, 146,080 sq.m., or 93,491,200 acres. Only two states in the union, Texas and California, exceed in size. See map.

History.—Part of the region now comprising M. was included in the "Louisiana purchase," and part in the "Oregon country" acquired by the treaty with Great Britain in 1846. The aborigines who lived in or roamed over this vast tract were the Blackfeet, who were sun-worshippers, in the n.; the Assiniboines, in the n.e.; the Crows and northern Cheyennes, s. of the Yellowstone, and other tribes of lesser note. It is thought that the brothers La Vérendrye, explorers from Canada, who journeyed in that direction in 1743, may have visited the Big Horn range. Traders belonging to the Hudson Bay, Northwest, and St. Louis fur companies early entered the valleys, and the Lewis and Clark expedition passed through the country. Fort Benton, at the head of navigation on the Missouri, was long an important trading post, but M. had few white inhabitants besides trappers, hunters, and missionaries, until the discovery of gold in 1862. Then, as in California, at a corresponding period, a mixed and largely mercenary class of immigrants came in, and the lawlessness and immorality that prevailed in certain localities compelled the organization of vigilance committees. In 1864, May 26, the territory of M. was formed from parts of Idaho and M., and in 1875 Helena was made the capital. In 1873, Aug. 4 and 11, fierce battles occurred on the Yellowstone between U. S. troops under Gen. Custer, and in May, 1876, in an attack on the confederated Sioux tribes, under Sitting Bull, in Rosebud River valley, Gen. Custer and his entire command were massacred. This was followed by the removal of the Sioux living e. of the Missouri and the throwing open of the country n. of the Yellowstone to settlers. In 1889, Feb. 22, congress passed an "omnibus bill," providing for the admission of Montana, Washington, and the Dakotas. A constitutional convention met in July; in Oct. the constitution was adopted and U. S. senators and a congressional representative were chosen, and on Nov. 8 the state was admitted to the union.

Topography.—M., deriving its name from the rough and mountainous character of its surface, but sometimes popularly called "the Land of the Silver Bow," contains the main range of the Rocky Mts., which enter the w. portion from the n. and extend 200 m. s.e. in that section, then change their direction and trend towards the w. boundary, where they join the Bitter Root Mts. South of the great falls of the Missouri, and separating the sources of that river from those of the Yellowstone, lies the Belt range, uniting with the Bitter Root Mts. in the n.w. corner of Wyoming. Besides these prominent ranges there are many spurs, detached elevations, and smooth sloping buttes. This mountainous region constitutes about two-fifths of the surface, extending the entire length of the territory from n. to. s., and for 175 m. e. of the w. boundary, the general elevation being much less in the n. than in the s. portion. Between these ranges are deep divides; around the spurs wind beautiful rivers; and picturesque cañons separate the buttes. In the southern portion, near the Yellowstone River, the mountains rise more than 10,000 ft. above the level of the sea, wearing a crown of perpetual snow, and in the n., beyond the Missouri River, the tops of the mountains in autumn are streaked with snow and are visible for many miles across the level, treeless plains. Away from the strictly mountainous portion there are solitary peaks of basalt, tuff, and other volcanic rock, of material such that though presenting a rocky appearance, or one of great solidity, much of it can easily be cut with a

knife. In the crevasses of the mountains, however, may be found green places bearing pine, cedar, and fir trees, and susceptible of cultivation, while the light-brown grass of the plain below, brown by contrast with the vivid green of the moister soil, furnishes nutritious food for cattle. The valley lying n. and s. of Fort Owen is 3284 ft. above the level of the sea, and is eighty miles long, varying from five to ten miles in width. The soil is a rich dark loam. The Missoula valley is 15 m. wide for 30 m., is well wooded, and has a moderate climate. Prickly Pear valley, from five to fifteen miles wide and twenty miles long, with beautiful smooth meadows, is in the vicinity of Helena. The valley of the Teton is from two to six miles wide, with bordering table-lands 75 ft. above the valley level, and is within easy distance of Fort Benton. Deer Lodge valley is 5000 ft. above the level of the sea, and is 40 miles long and about 12 m. wide, with a central stream flowing through it, fed by rivulets running down from the mts. on either side. Sun River valley is from one to three miles wide. The stream is rather swift, and from the "crossing" on the road from Fort Benton to Helena, the valley is about 5 m. wide for 25 m. North of the Yellowstone, and between it and the Missouri, are prominent ranges known as the Belt, Judith, and Highwood Mts.; beyond the Missouri lie the Bear Paw and Little Rocky Mts. The highest eminence in the state, Emigrant Peak, in the s. w., is 10,969 ft.; Mt. Powell is 10,500 ft. high. The Judith basin is 50 m. wide and 80 m. long, and is traversed by the Judith River and three tributaries, West Fork, South Fork, and Big Spring creek. In the area between these valleys are extensive cattle ranges. Eastern Montana is made up of bottom lands, extensive benches or terraces, buttes and rounded eminences, and long spurs or divides which ascend into mts. The plains, which at the Yellowstone are 2010 ft. above the sea, rise gradually to 4090 ft. at the base of the mountains, and the elevation of the valleys varies from 3000 to 5000 feet.

M. is abundantly watered. The Missouri, rising near Gallatin, in the s.w., is formed originally of the Jefferson, Madison, and Gallatin rivers, termed "the three forks," and flows n.e. to Helena, following thence an e. course to Fort Benton and the Dakota line. This river is navigable by steamboats from Apr. to Sept. as far as Fort Benton, 303 m. from the eastern boundary line of M. Its chief tributary, the Yellowstone, rising in Yellowstone Park in n.w. Wyoming, is also navigable in the early season for 300 m., and is fed by the Big Horn, Powder, Rosebud, Tongue, and other streams. Of the many lesser affluents of the Missouri, the Marias, Milk, Muscleshell, Big Muddy, Judith, Poplar, and Little Missouri may be mentioned. Clarke's Fork of the Columbia river rises in the western part of the state, is formed by the junction of the Flathead and Missoula rivers, drains 40,000 sq.m. of country, and flows n.w. into Idaho. In the n.w. corner is Flathead Lake, 30 m. long and 14 m. wide. The scenery, which is grand and impressive in character, includes some remarkable cañons and waterfalls, the castellated bluffs along the upper Missouri, and the palisades of the Yellowstone. A portion of Yellowstone Park lies in M. At the great falls of the Missouri, the river descends 357 ft. in a course of 16½ m. The highest fall is 87 ft. Eighteen miles north of Helena, the Missouri enters a gorge, 12 m. long, named by Lewis and Clarke the Gates of the Rocky Mts. Here cliffs from 500–1500 ft. high rise from the water, and the distance across is contracted to 450 ft. M. contains many hot, cold, and medicinal springs. The hot springs near Helena are widely known, and Hunter's springs, a popular resort 18 m. e. of Livingston, were famed among the Indian tribes of the northwest for their healing virtues.

Geology and Mineralogy.—In its geological construction the eozoic and Silurian formations prevail in the w., and eastward first the Jurassic appears, next the cretaceous, and near the Dakota line the tertiary. Along the base of the mountains are beds of Jurassic and carboniferous rocks. In all sections the strata are much broken, and present formations of almost every geologic age. The Rocky Mt. range and the great basins of the n.w. and s.w. are chiefly of igneous origin, and are made up of granite, basalt, and metamorphic rocks. Petrified sea-serpents, snails, snakes, wood, etc., abound near the Missouri, and in the Bad Lands of the s.e many remarkable fossils are obtained. The mineral resources are vast and are only partially developed. In the production of lead and copper M. leads the states, and in the production of silver and gold stood 3d in 1886. Gold was first discovered in 1852 near the present site of Deer Lodge. The first mine was opened in 1861 and the first quartz-mill was built in 1863. Helena, Butte, and Virginia City are important gold-mining centers. Bituminous and lignite coals underlie nearly every co., and the deposits in the valleys of the Yellowstone, Missouri, and other rivers are of great extent and value. Iron ores of high grade, marble, slate, limestone, granite, sandstone, fire, and brickmaking clays are widely distributed, and tin and petroleum have been discovered. Output of the precious metals, 1895, about $50,000,000.

Zoology.—The mountains and plains abound with large game: the mountain sheep, Rocky Mountain goat, moose, elk, mountain lion, black and white-tailed deer, and antelope. In the woods and along streams are found grizzly bears, black bears, badgers, martens, beavers, otters, etc. Gray wolves and jack rabbits are common on the prairies. A few carefully preserved buffaloes are all that are left of the great herds that formerly roamed the plains. Among wild-fowl are the grouse, prairie chicken, partridge, pheasant, quail, goose, and duck. The rivers and lakes supply whitefish, salmon, trout, and graylings.

Botany.—M. is well wooded, except on the eastern plains, which are almost destitute of anything but grass and shrubs. In parts, as in the n.w., it is densely timbered, but largely with deciduous trees. In the valleys, cottonwoods of great size abound, together with the ash, poplar, hickory, and willow, one species of which, the "diamond willow," is much sought for by tourists. Pines 150 ft. high, tamaracks, firs, spruces, balsams, and cedars grow on the mountains and uplands. Cacti and sage-brush are seen in sterile districts. Bulberries, which resemble red currants, grow along the rivers, and wild strawberries on the prairies. Bunch, buffalo, and gama grass cover the prairies and hillsides, furnishing most nutritious forage for cattle.

Climate.—The climate is mild but bracing. The summers are dry and warm, but the nights are always cool. In the Yellowstone valley, except during May and June, the grass and herbage are parched and brown, giving the landscape a somber aspect. The most delightful season is autumn. The winters are usually short and are tempered by the "Chinook" wind. Severe cold is not experienced until Christmas. The mean annual temperature is about 46°. The annual rainfall is light, and in some years so little snow falls that the minor streams dry up.

Soil and Agriculture.—The alluvial soil of the valleys, although not always deep, is very rich; the bench lands are not much inferior, and the once-despised desert lands are now made by irrigation to yield grain instead of sage-brush. The capital invested in irrigation is very large. The most valuable crops, in their order, are hay: over $3,250,000; oats, about $1,000,000; wheat, about $800,000; potatoes, nearly $300,000; barley, about $100,000; and corn, about $25,000—all having an annual value of about $5,500,000. The farm and ranch animals average nearly 5,000,000 head (cattle, over 1,100,000; sheep, over 3,100,000), of a total value of more than $31,500,000. The annual wool clip is about 7,000,000 lbs. Potatoes and pumpkins of large size are raised, with fine apples, plums, and other fruits. The fattening of beef from Texas is an important business. In sheltered valleys cattle and horses roam the plains all winter, and the percentage of loss, except in unusual seasons, is small. The tendency of the snow to drift leaves large areas of grass exposed, enabling the stock to feed without assistance. Sheep often require hay and some protection from storms. The number of extensive cattle ranges is smaller than formerly.

Manufactures, etc.—In the larger towns the manufacturing productions are rapidly increasing. The cost of transporting machinery, making the price of manufactured articles higher than that of the same articles imported from the states, has retarded the growth of industries, but flour, meal, lumber, jewelry, tinware, and brick are largely manufactured, and malt liquors are made. The steam quartz-mills, used principally for gold, and steam saw mills, are a good investment. Freight transportation, trade with the Indians, and that which comes over the Canadian line, are the channels of commercial prosperity. The mineral products of Montana are very valuable. In 1895 the state ranked first in production of copper, second in silver, third in gold, and fourth in lead, the official report from the U. S. assay office at Helena showing: Copper, 201,093,992 lbs., value, $21,114,869; silver, 17,701,658 fine oz., coining value, $22,886,992; gold, 209,320 fine oz., value $4,327,040; and lead, 24,139,504 lbs., value, $754,350. A large amount of foreign capital is invested in the mines of this state.

Railroads.—The principal railroads are the Northern Pacific and the Great Northern, with their branches; total length, 1896, about 2900 miles; cost of local roads and equipments, $34,938,811; capital stock, $13,976,100; funded debt, $19,943,000; net earnings, $608,814. In many sections stages are the only means of conveyance, and in mountain regions saddle-horses and pack mules are largely used. At places on the Yellowstone, flat-bottomed ferry-boats are used, attached by ropes and pulleys to elevated cables stretched across the river.

Banks.—In 1896 there were 25 national banks in operation, with combined capital $4,155,000, and deposits $11,289,721; 7 state banks, capital $425,000, deposits $884,534; 2 stock savings banks, capital $200,000, deposits $816,077; and 6 private banks, capital $171,060, deposits $197,586.

Religious Denominations, Education, etc.—The leading denominations are the Methodist Episcopal, Methodist Episcopal South, Christian (Disciples of Christ), Roman Catholic, Presbyterian, Protestant Episcopal. The public schools are supported by direct co. and district taxes and penal fines for violation of laws. In 1894–5 there were 35,220 children of school-age, of whom 26,840 were enrolled in public schools and about 1,000 in private schools; public school-houses, 572; value public school property, $1,741,596; expenditure of year, $655,579. Under the act of admission into the union the legislature in 1893 passed acts establishing a state university at Missoula (opened 1895), a state agricultural college at Bozeman, a state school of mines at Butte (corner-stone laid 1896), a state normal school at Dillon (completed 1896), a state deaf and dumb and blind institution at Boulder (completed 1897), a state reform school at Miles City, and a state orphans' home at Twin Bridges. The support of future public schools is liberally provided for by the action of the general government heretofore, in setting apart one-eighteenth of the public lands for the benefit of schools, and in pursuance of that law the 16th and 36th sections have been so set apart and designated; the area exceeding that of the state of Massachusetts.

AREA AND POPULATION OF IDAHO, MONTANA, AND WYOMING BY COUNTIES.

INTERNATIONAL CYCLOPÆDIA.

COPYRIGHT, 1891, BY DODD, MEAD & COMPANY.

LIBRARY
UNIVERSITY OF ILLINOIS
URBANA

GOVERNMENT, ETC.—The capital is Helena. The executive department consists of a gov., lieut.-gov., sec. of state, treasurer, supt. of public instruction, a railroad commission, a state board of education, and a commissioner of public and school lands. The gov. has the power to veto certain items of appropriation bills without necessarily rejecting the whole bill. The senate may confirm or reject nominations made by the gov. The legislature, which meets biennially, consists of a senate, of one member from each co., and a house of representatives; number of senators (1897), 23; representatives, 68. The session is limited to 60 days. The legislature is forbidden to pass special legislation laws, but may pass general laws for taxation of any property. Churches, public property, and libraries are exempt from taxation. Mines are taxed according to value paid the U. S. for the same. Their machinery is subject to a special taxation as private property, and cannot be sold for taxes. The limit of taxation is three mills; if assessed on property over $100,000,000, 2½; if over $300,000,000, 1½ mills on the dollar. Misappropriation of public funds by officers disqualifies the offender for 10 years from holding office. The power of the state is limited in incurring indebtedness, as are the powers of counties, towns, and cities. The courts comprise a supreme court, district court, courts of justices of the peace, and co. courts for trial of minor issues. Judges are elected by popular vote. Women are allowed to vote at school elections, and at other elections where as taxpayers they are interested in the question at issue. A local option liquor law was passed in 1887. The legal rate of interest is 10 per cent.; any rate is allowed by contract, and there is no penalty for usury. The militia comprises 526 officers and men; unorganized but available for military duty, 25,000. Besides the institutions already mentioned, there are Fort Harrison, at Helena, a United States military post, state prison at Deer Lodge; insane asylum at Warm Springs; soldiers' home at Columbia Falls; an Indian school at fort Shaw; and the college of Montana (Pres.) at Deer Lodge. The state cast 3 electoral votes in 1892 for Harrison and Reid; 1896, Bryan and Sewall, 3.

FINANCES.—In 1895 the legislature authorized the issue of bonds for $150,000 for educational purposes, and these bonds constituted (1897) the only bonded indebtedness. The assessed valuations, as equalized 1896, aggregated $124,076,585, of which over $10,500,000 was against railroad property.

POPULATION.—In 1870, 20,595; 1880, 39,159—3774 col'd, including 1765 Chinese and 1663 civilized or taxed Indians; foreign born, 11,521; male, 28,177; female, 10,982; dwellings, 9205; families, 9931; persons to sq. m. 0.3; engaged in agriculture, 4513; in manufacturing, mining, etc., 8022; pop., by census of 1890, 132,159. There are 23 cos.; for pop. 1890, see census tables, vol. XV. The principal cities and towns, 1890, were Helena, 13,834; Butte, 10,723; Great Falls, 3,979; Anaconda, 3,975; Missoula, 3,426; Livingston, 2,850; Bozeman, 2,143; Walkerville, 1,743; Marysville, 1,489; and Deer Lodge, 1,463.

The tribal Indians, chiefly Crows, Blackfeet, Yankton Sioux, Assinaboines, Gros Ventres, and Pend d'Oreilles, are located on 5 reservations, embracing an area of 45,000 sq.m. of fine agricultural and grazing land, of which only a small portion is cultivated.

MONTANARI, GEMINIANO, 1632–87; b. Italy; astronomer and author of a number of scientific treatises. The method of determining the height of mountains by means of the barometer is said to have been a discovery of his. He was prof. of mathematics at Bologna, and in 1674 was called to the univ. of Padua to become lecturer on astronomy.

MONTANELLI, GIUSEPPE, 1813–62; b. in Tuscany, and studied law in the University of Pisa, where he aftewards became professor of jurisprudence and commercial law. In the Italian revolution of 1848 he participated, and was for some time an Austrian prisoner. From that time until Tuscany became a part of Italy (1860) Montanelli took a very active share in the tumultuous political movements of the province, though for the greater part of the time compelled to remain outside its boundaries. He organized secret societies, wrote pamphlets and articles for the press, and in every way urged on the cause of Italian unity. He published his memoirs in 1853, wrote a number of lyric poems, and was the author of *Camma* and adapter of an Italian version of Médée, both tragedies being performed with Mme. Ristori in the title roles.

MON'TANISTS. See MONTANUS.

MONTA'NUS, a celebated heresiarch of the early Christian church, was a Phrygian by birth, and made his first public appearance about 160 A.D., in the village of Ardabar, on the confines of Phrygia and Mysia. He was brought up in heathenism, but embraced Christianity with all the fanatical enthusiasm for which his countrymen were noted.

Montanus's standpoint was, *in theory,* the exact opposite of that occupied by the Gnostic sects; yet, *in practice,* it led to a similar exclusiveness and sectarianism. He believed in the constancy of supernatural phenomena *within* the church. The miraculous element, particularly the prophetic ecstasy, was not removed; on the contrary, the necessity for it was greater than ever. He considered those only to be true or perfect Christians who possessed the inward prophetic illumnination of the Holy Spirit—they were the true church; and the more highly gifted were to be looked upon as the genuine successors of the apostles, in preference to the mere outwardly consecrated bishops. Thus, they form a religious aristocracy, as arrogant as the Gnostics: the difference between the two simply being that the Montanists prided themselves on a kind of inflamed inspiration, and the Gnostics on a calm and serene illumination of the reason. Neither party wished to recede from the Catholic church, but rather to exist as an esoteric body within its pale. It was persecution, caused, no doubt, by their own insolent

obstinacy, that forced them into a sectarian course. Montanus did not meddle directly with the creed of the church; in fact, he was not a thinker, nor a man of almost any importance intellectually. His efforts were confined to stirring up the Christians generally to fresh religious life—to a belief in a fresh outpouring of the Holy Ghost. At first, Montanus contented himself with predicting fresh persecutions, exhorting men to greater strictness and holiness of life, and announcing judgments to come upon the persecutors; but his idea of his own mission afterwards became more exalted, and he claimed to be in a very special sense a prophet of God—the organ chosen by the Holy Ghost to purify, enlighten, and advance the church. Among the things on which the Montanists laid stress was an ascetic mode of life, scorn of persecution, and love of martyrdom; connected with these, and, indeed, flowing from them, was an aversion to second marriages, and to the restoration of the LAPSED (q.v.). Like other enthusiasts, they also were firm believers in the near approach of the millennium (q.v.) and in the personal advent of Christ. Two "prophetesses," Priscilla and Maximilla, were associated with Montanus in his work. A decree for the expulsion of Montanus and his followers from the communion of the Catholic church was issued by Eleutherus, bishop of Rome. The Montanists at once proceeded to organize themselves as a distinct sect. They found a singularly able apologist in Tertullian (who became a Montanist about 200 A.D.), and continued to exist till the 6th century.

MONTA'NUS, ARIAS. See ARIAS MONTANUS.

MONTARGIS, a t. of France, department of Loiret, is situated at the junction of the canal of Briare with that of Loing, 29 m. s. of Fontainebleau. Montargis has a church, theater, library, and college; and manufactures paper and india-rubber goods. Pop. '91, 11,600. In its vicinity is an extensive forest of the same name.

MONTAUBAN (Lat. *Mons Albanus*), a t. of France, capital of the department of Tarn-et-Garonne, is situated in a rich and beautiful country on the river Tarn, 29 m. n. by w. of Toulouse. It is the seat of a bishop, has a fine cathedral in the Italian style, finished in 1739, built on the site of a still older monastery, the *Mons Aureolus* (Golden Hill), and is a well-built, handsome town. The houses are mostly of brick. Besides having large manufactures of woolens and beet-root sugar, large dye works and distilleries, it carries on a great trade in wine and grain. Montauban was founded in 1144, by count Alphonse of Toulouse, became the seat of a bishop in 1317, embraced the reformation in 1572, and suffered severely in the civil wars that ensued. It has acquired historical celebrity as the great stronghold of the Huguenots. Protestantism still exists here, and maintains both an academy and a theological college. Pop. '91, 30,400.

MONTAUK POINT, a promontory at the e. extremity of Long Island, in the state of New York. It is in the township of East Hampton, about 7 m. from Sag Harbor, in Suffolk county. It is a light-house station, with a fixed light, varied by a white flash every two minutes, 168½ ft. above the level of the sea, and a Daboll trumpet, and the point also has a U. S. life-saving station. It was named after the Montauk tribe of Indians.

MONTBELIARD (Ger. *Mömpelgard*), a t. of France, in the department of Doubs, 9 m. s.s.w. of Belfort. It lies in a valley between the Vosges and Jura mountains, is surmounted by an old château, now used as a prison, and carries on manufactures of cotton goods, hosiery, and silks. Clocks, watches, files, and agricultural implements are also made. Pop. '91, 9168.

MONT BLANC, the highest mountain in Europe, and, according to the latest measurements, 15,781 ft. above the level of the Mediterranean sea, is one of the Graian Alps, and is situated in the department of Haute-Savoie, France, close to the Italian frontier, and 37 m. s. of the e. end of the lake of Geneva. The vales of Chamouni and Mountjoie lie on the w., and those of Ferret and Allée Blanche on the e. side of it. The waters which spring from its western slopes are drained off to the Arve, and thence to the Rhone, while those which rise on the e. side are feeders of the Dora Baltea, a tributary of the Po. It has 3 snow-clad peaks, and 36 glaciers, of which 16 lie on the n., and 20 on the s. side. The highest summit is a narrow ridge 50 yards by 16, called *La Bosse du Dromedaire*, covered with firm snow, and very steep towards the north. In 1760 Saussure offered a prize for the discovery of a practicable route to the summit of Mont Blanc, which was gained, in June 1786, by Jacques Balmat, a guide. Saussure himself ascended the mountain the following year; and the same feat has since been performed by many, especially since Albert Smith published the well-known pictorial and dramatic description of his ascent in 1851. In Sept. 1893, an observatory was erected near the summit, at an altitude of 14,350 ft.

MONTBRISON, a t. of France, in the department of Loire, 20 m. n.w. by w. of St. Étienne, on the Vizezy, a feeder of the Loire, stands at the base of a lofty and precipitous rock. In the vicinity are mineral springs. Pop. '91, 6882.

MONTCALM, a co. in s. central Michigan; 720 sq. m.; pop. '90, 32,637, chiefly of American birth. The surface is undulating, and covered with a heavy growth of timber. The pine and the sugar-maple abound. The soil is rich, and produces good crops of Indian corn, wheat, oats, potatoes, and grass. Other staples are wool, butter, and maple sugar. The manufacture of lumber is extensively carried on, and there are many saw-mills. Other manufacturing industries are boots and shoes, flour, sashes and blinds,

and carriages. It is drained by the affluents of the Chippewa, Grand, and Muskegon rivers. Co. seat, Stanton.

MONTCALM, a co. in s.w. Quebec, Canada, n. of the St. Lawrence river, watered by the North, Du Lièvre, Rouge, Lac Ouareau, and Gatineau rivers ; 4027 sq.m.; pop., 12,131. Co. seat, Ste. Julienne.

MONTCALM DE CANDIAC. See CANDIAC.

MONTCALM DE SAINT-RÉVAN, LOUIS JOSEPH, Marquis de, b. near Nismes, 1712 ; entered the army at the age of 14, at 18 was a capt. ; served in Italy and Germany for many years, and was wounded at the battle of Piacenza in 1746. He became a field officer in 1756, and was sent to Canada in May of that year to make head against the English. He captured Fort Ontario at Oswego in August of the same year. The next season he forced the capitulation of Fort William Henry at the head of Lake George, with an English garrison of 2500 men, capturing 42 guns and a large amount of stores. In 1758 he defended Fort (Carillon) Ticonderoga with 3600 Canadians, against Gen. Abercrombie at the head of 15,000 English, which resulted in a bloody repulse of the latter after an attack of determined vigor. Lack of troops, ammunition, and provisions, and the large re-enforcements of the English, obliged Montcalm to retire all his forces the following year to the defense of Quebec, menaced by a powerful army under Gen. Wolfe. The struggle for that stronghold began July 31, 1759, by an attack which was repelled. The siege was then continued for six weeks without any success on the part of the English, when Wolfe conceived a new plan of operations, and succeeded in secretly scaling the cliffs above Quebec with his entire army, and on Sept. 13 appeared on the heights of Abraham in the rear of Quebec. Montcalm promptly prepared for battle in the open field, and at 10 o'clock led the attack in person. His troops, however, were not veterans and the English were. The English assumed the offensive. Wolfe fell dead in the moment of victory, and Montcalm was borne from the field mortally wounded. When told he must die he said : "It is well ; I shall not live to see the surrender of Quebec." The city was not surrendered till several days after his death. In 1827 Governor Dalhousie, of Canada, caused a monument to be erected in Quebec to the joint honor of the two brave generals who fell on the field where France lost and England won the Canadas.

MONT CENIS. See CENIS.

MONT CENIS TUNNEL. See TUNNEL.

MONTCLAIR, a town in Essex co., N. J.; on the Delaware, Lackawanna, and Western and the New York and Greenwood Lake railroads; 5 miles n. by w. of Newark, the county seat, 14 miles w.n.w. of New York. It was incorporated as a town in 1895; is on one of the ranges of the Orange mountains; and is locally divided into Montclair, Upper Montclair, and Montclair Heights. It is a residential town, peopled chiefly by the families of New York business men, and has a hospital, public library, military academy, high school, state and savings banks, water supply from the Pequannock watershed, about a dozen churches, and weekly newspapers. The heights command a fine view of New York and its harbor. Pop. '90, 8,656.

MONT DE PIÉTÉ, called in Italy MONTE DI PIETÁ, a charitable institution, the object of which is to lend money to the very poor at a moderate rate of interest. It had its origin at the close of the mediæval period, when all such transactions were in the hands of usurers, to whom the necessities of the poor were but an inducement to the most oppressive extortion. This institution originated with Francisco di Viterbo, a Minorite friar, in the year 1491, in Padua. He preached publicly against usurers, particularly the Jews, who had the most of that business in Europe ; and though opposed even by some of the church orders, notably the Franciscans, he succeeded in inducing the pope to issue a bull in his favor, when opposition died out. The monk's plan was that the rich should combine to assist the poor by lending them money without interest on pledges or pawns. The idea became popular, and the institution spread to Assisi, Mantua, Parma, Naples, and Rome; and soon these establishments gained a foothold in Germany, France, and Russia. They were known under different names: "Lombard house," "mons pietatis," "mont de piété," "banco di rovere," etc. In Rome, Gregory XIII. established a bank of deposit specially for widows and orphans, whose deposits were guaranteed by a lien on the goods of the bank. Sextus V. added to this permission to deposit goods and articles of any value and of every description. Soon this bank reached a height of wealth and power unexampled in the history of such institutions, and was frequently enabled to loan immense sums to states and sovereigns. In Turin the Jews held the money power, and 30 per cent was a common rate of interest among them. In 1519 a mont de piété was established there and the system of extortionate interest was broken up as a result. But this institution was unable to sustain itself, from the fact of charging no interest, and would have failed but that the *compagnie de St. Paul* came to its rescue with the suggestion of a charge of 2 per cent, on which basis it continued business with success. This establishment continued in existence until near the close of the 18th c., when it succumbed to the political convulsions of the period: it was, however, revived in 1822. The mont of Milan was formed by the union of 36 private establishments, and became one of the largest in Italy. It is now nearly 500 years old. In 1833 the capital of this establishment was 671,000 Austrian livres. Among the earliest monts in Italy was one at Cremona for lending corn at interest; it was called the *mons*

frumenti pietatis. The custom of charging interest, which has obtained among Monts de Piété ever since, was licensed in 1515, when the Lateran council in Rome decided that these banks could lawfully charge a sufficient percentage for the use of their money to cover their expenses. At Rome the charge was about 6½ per cent per annum, but this charge has been greatly increased in most of the Italian cities. When Napoleon entered Italy in 1796 he robbed the Mont de Piété of many valuable treasures. The establishment of Monts de Piété in France began in the latter part of the 17th c., the first one being at Marseilles in 1695. One appeared in Paris in 1726 in the reign of Louis XIII., but soon failed. In 1769 Turgot tried to re-establish it, but without success; and it was not until the period of Necker's financial administration that it became firmly fixed as a permanent institution. Five years after the establishment of this mont, there were more than 40,000 watches in its vaults. Next to the Paris mont, those of Lyons and Marseilles are rated most important. A Mont de Piété was established in Copenhagen, Denmark, in 1688, and flourished in private hands until 1753, when it was purchased by the naval hospital for 6,000 rix bank dollars: about $3,000. The rate of interest throughout Scandinavia has been from 9 to 12 per cent. The first Monte Pio in Spain was opened at Madrid in 1703, and in 1773 an attempt was made to place it in the hands of the government, but without success. The capital of the monts of Valencia, Malaga, and Galicia was at first derived from vacant benefices, termed *espolios y vacantes.* The two Russian monts were established in 1772—"to put an end to the devouring cupidity of the usurers, by offering prompt assistance to those who are so unfortunate as to be suddenly thrown into need." The income over expenses derived from these monts has been devoted to the support of the foundling hospitals, always an object of fostering care on the part of the Russian government. The rate of interest was originally 6 per cent, was afterwards doubled, and finally again reduced, this time to the legal rate. It has always been a Russian custom to deposit plate and other valuables with the mont for safe-keeping; and in 1813, when Napoleon marched on Moscow, the amount loaned by the establishment in that city was more than five times the average sum. In 1817 the St. Petersburg mont lost by a defalcation more than $1,000,000. The Mont de Piété has never been successfully established in Great Britain; one was opened in the city of Limerick, Ireland, in 1837, and was useful in ameliorating the condition of the poor while it lasted; but it did not become permanent, and the private pawnbroker has always occupied the field in the British Islands. There is no record of any institution of the character of the mont de piété having been established in the United States. The distinction between this institution and the ordinary pawnbroker's shop should always be sharply drawn; the one is a beneficent institution, designed to accommodate the poor in the first instance, and, after payment of expenses, to devote any surplus to the sustenance of some charity or public work; the other is simply a business enterprise, conducted for private profit. See PAWNBROKING.

MONTEBELLO CASTEGGIO, a village of northern Italy, in the province of Pavia, 12 m. s.s.w. of Pavia. It stands in a plain on the banks of the torrent Schizzola. Here the Austrians were defeated by a French army under Gen. Lannes, after a desperate conflict, June 9, 1800. The title of duke of Montebello was conferred on the victorious French general five years later. In May, 1859, the Austrians were again defeated here by the united armies of the French and Piedmontese. See CASTEGGIO.

MONTE CARLO is a famous pleasure resort, particularly noted for its gambling saloon, and situated in the little principality of Monaco in north-western Italy. Monaco is the smallest independent country in the world, having an area of only about eight square miles, and lying on a barren rocky ridge between the sea and lofty, almost inaccessible rocks. The soil is too barren for grain-fields, or even to afford pasturage for flocks, though there are a few fine fruit gardens. So, for centuries, the Monagasques, as the inhabitants are called, subsisted by marauding expeditions both by sea and land; or, in times of peace, by commerce with Genoa, Marseilles, and Nice. But, in the present century the people have turned their attention entirely to making their city one of the most attractive resorts in Europe. In 1860, M. Blanc, proprietor of the gambling *salons* of Homburg and Baden, went to Monaco, and offered to the prince an immense sum of money for the privilege of establishing a similar institution within his territory. The prince readily perceived that this would render his capital as attractive as any resort in Europe, and accepted a large sum of money, which was paid at once, conditions having been mutually agreed upon. Papers were signed and work was begun immediately on the barren hill of Monte Carlo, a mile from the town. In a comparatively short space of time, immense marble buildings rose from the midst of such wondrous beauty as to be almost called a modern rival of the gardens of ancient Babylon. The garden itself is planted upon terraces cut from the solid rock, and contains specimens of rare and curious plants from every quarter of the globe. The Casino contains two *salons de jeu,* a reading room, a concert hall, and three reception or ball rooms. It is built of white marble, and its external appearance is of the Italian style, while internally, the rich coloring and elaborate gilding are so skillfully blended as to please the eye, without dazzling or offending. The Hotel de P. is to the left of the Casino, and is said to contain the finest dining-room in Europe. The Grand Café stands at the right of the Casino, and is also a beautiful building. Near this is a famous jeweler's store, where jewelry of all sorts is frequently left on a loan by paying reasonable interest. Between and around

these buildings are gardens beautiful with shrubbery, statues, and vases, while in the centre, a graceful fountain sends forth a lofty jet of water that falls back in a brazen basin of elegant design. In the summer, the Casino orchestra is usually stationed on the great terrace. It gives two concerts daily, and the square is crowded with listeners—not only the *habitués* of the place, but also those who come from neighboring cities for the sole purpose of hearing the music. The population in 1890 was 3794.

MONTÉ-CASI'NO. See CASINO, MONTE.

MONTECATINI, a village of Tuscany, situated on a spur of the Apennines, 25 m. w.n.w. of Florence, derives its name from the bowl-shaped hill on which it stands. It is of very ancient origin, and was formerly called *Castello*. In the close vicinity of the town are the famous mineral springs of the same name, in high repute for their curative properties, especially in diseases of the liver and digestion. Excellent accommodation can be had by visitors both in private establishments and those under government direction.

MONTECATINI DI VAL DI NIEVOLE, a t. in Italy in the province of Lucca; pop., commune, 6964. Its mineral springs are much frequented by invalids, and have a high reputation throughout Europe.

MONTECHI'ARO, a market t. of northern Italy, in the province of Brescia, situated on a height on the left bank of the Chiese, in the center of an amphitheater of hills. Pop. 6,933. The chief manufacture is silk. In 1796 the Austrians were defeated here by a French army.

MONTE CRISTO, a small island, belonging to Italy, 26 m. s. of Elba. It consists of a mountain of granite 2110 ft. above the level of the sea, and in 1874 was made a penal colony. Little of its land is arable. It is inaccessible except by one narrow landing-place. Monte Cristo has given name to Dumas' well known novel.

MONTECUCULI, RAIMONDO, Count, b. near Modena, 1608, and entered the Austrian artillery as a volunteer under his uncle, Ernesto, count Montecuculi, in 1627. During the Thirty Years' war he found many opportunities of distinguishing himself, received rapid promotion, and was employed in various services, military and diplomatic. In 1657 he was sent to support the king of Poland, John Casimir, against the Swedes and Rákóczy, which he did with great effect, compelling Rákóczy to make peace with Poland, and to break his alliance with the Swedes. In the following year he was made a field-marshal, and was sent to aid the Danes against the Swedes, in which also he was eminently successful. In 1660 he commanded the army sent to oppose the Turks, who had broken into Transylvania, and skillfully kept them in check till the arrival of the French, with whose assistance he won the great battle of St. Gotthard, on the banks of the Raab, Aug. 1, 1664—the first decided triumph of European tactics and discipline over the mere numbers and daring of the Ottoman hosts. When the war broke out between France and Holland, in which the emperor took part with Holland, Montecuculi received the command of the imperial army in 1672. He took Bonn, and notwithstanding the endeavors of Turenne to prevent it, effected a junction with the prince of Orange. In 1675 he was opposed to Turenne on the Rhine, and they spent four months in maneuvers in which neither could gain any advantage. After this campaign, Montecuculi spent the remainder of his days at the imperial court and in the society of learned men. He was himself a man of learning and various accomplishments, and has left works on the art of war, on the Turkish war, and on the war of 1664, and also sonnets. The emperor Leopold made him a prince of the empire, and the king of Naples bestowed on him the duchy of Melfi. He lost his life by the fall of a beam as he was entering Linz with the imperial court, Oct. 16. 1681. His writings were published in the original Italian by Ugo Foscolo (2 vols. Milan, 1807); and by J. Grassi (2 vols. Turin, 1821). A semi-autobiographic memoir was translated into Latin, and published at Vienna, under the title of *Commentarii Bellici*, in 1718.

MONTEFIORE, Sir MOSES HAYIM, b. London, 1784; from a wealthy Jewish family of bankers; married, in 1810, a connection of the Rothschilds. In 1829 he visited Palestine, became interested in the Jews in that country, and thereafter devoted himself greatly to their benefit. He also assisted the Jews in Poland; and throughout his life he was earnest in the conduct of plans for the amelioration of the condition of his race. In 1846 he succeeded in influencing the czar Nicholas in their behalf; and in 1863 obtained a firman from the emperor of Morocco which afforded protection to the Jews in his dominions. He endowed a Jewish college at Ramsgate, England, in 1867, in memory of his wife, who had died five years before. He d. greatly esteemed, 1885.

MONTE'GO BAY, a small but flourishing seaport on the n. coast of the island of Jamaica, in Cornwall co., 18 m. w. of Falmouth. It has a harbor protected by a breakwater, is defended by a battery, and carries on a general trade of some importance. Many vessels visit the port annually. Population variously stated at from 4,000 to 5,000.

MONTE'GUT, JEAN BAPTISTE JOSEPH ÉMILE, b. at Limoges, 1825, and educated there. He was a student of law when his first step into the literary world was made by an article contributed to the *Revue des Deux Mondes* on the philosophy of Ralph Waldo Emerson. He soon afterwards became one of the editors of the review; his contributions ranging through light literature, foreign *critiques*, and politics, until 1848, when social and political subjects

dominated, and were treated with little breadth of view. He soon resumed the study of English and American literature, and afterwards devoted his pen to contemporaneous French writings. From 1862 to 1870 he was associate editor of the *Journal de Paris*, and thereafter again editor of the *Révue des Deux Mondes*. His style is described as clear, trenchant, and of narrow view. He has translated into French Emerson's philosophical essays, with an introduction; Macaulay's history of England, and Shakespeare's works with commentaries and notes; and is author of a considerable number of original works.

MONTEM CUSTOM was a triennial procession of the Eton boys, on Whit-Tuesday, to a certain mound (*ad Montem*) known as the Salt hill, near the Bath road, and which was doubtless so called because certain of the boys levied tribute (for *salt* as the phrase went) from every person present, and even from any chance passer. These juvenile tax-gatherers were attired in fancy dresses of silk. The king and queen, besides many members of the nobility, frequently honored the procession with their presence; and on such occasions, as much as £1000 has been collected, which was given to the senior scholar to support him at Cambridge. The origin of the custom is unknown. It was discontinued in 1847.

MONTENEGRO (an Italian translation of the native name *Czernagora*, "Black Mountain"): a small but independent and recently extended principality situated between Bosnia and Albania. Till 1878 it was separated from the Adriatic by a narrow strip of foreign territory; but the Berlin conference assigned to it the port and district of Antivari, while closing it against the war ships of all nations. Towards the end of 1880, the port and district of Dulcigno (q. v.), previously Albanian, became Montenegrin. The latter place Turkey agreed to cede instead of an inland district indicated by the Berlin conference, but the persistent delay of the Porte to transfer Dulcigno, led to strong pressure and a naval demonstration by the Western Powers. The area is about 3,630 sq. miles; the population, according to official returns in 1879, was 220,000, but has since decreased on account of the emigration, and an estimate in 1896 placed it at 200,000. The capital is Cettigne or Cettinje, with a population of 1200. The chief towns are Podgoritza, with 6,000; Dulcigno, with 5,000; and Niksik, with 3,000.

The country, traversed by the Dinaric Alps is very mountainous, the highest points being Dormitor in the north (7,800 feet), and Kom in the east (7,500). In the e. and s. the hills are partly clad with forests. But the higher ridges and plateaus are bare of vegetation; and, being generally covered with loose masses of rock, give to M. an aspect of peculiar sterility and desolation. Yet the valleys are highly fertile; those of the Moratscha and Zeta, with the lowland on the lake of Scutari (into which the chief streams of M. debouch), form the granary of the land. The climate of the hill country, which is M. proper, is ungenial; that of the great valley and its connected region is delightful. It has only a small strip of coast, some 28 miles, and possesses no sea fisheries, but in the mountain streams of the interior trout abound. Agriculture is carried on wherever practicable, but the methods are of a very primitive kind. In general the land is the property of those who till it, but in some districts there are small peasant-holdings, while in others the métayer system occurs. The chief crops are oats, maize, tobacco, barley, and buckwheat. In some districts the vine is cultivated with success and around the cities of Antivari and Dulcigno olives are produced.

The Montenegrins or Zrnagorzes are Slavs of the Servian stock, and constitute almost the whole population of the country, the exception being some Albanians and others in the new territory. The constitution of the country is usually called a limited monarchy: probably it would be safer to speak of an absolute monarchy in which the council of state and the national assembly have considerable influence on the decisions of the prince. From 1516 to 1851 the head of the government was the Vladika or prince bishop, who, besides his proper office as ecclesiastical superior, exercised at the same time those of chief ruler, lawgiver, judge, and military leader. In 1851 the two offices were disjoined, and the Vladika was restricted to his ecclesiastical office, while the cares of government were left to the Gospodar (hospodar) or prince. Since 1879 the state council has consisted of 8 members, one-half of whom are appointed by the prince and the other half are elected by the male inhabitants who are able to bear arms. In 1879 the country was divided into 80 districts and 8 military commands. Besides these there exist the time-honored patriarchal institutions. The country is divided into about 40 tribes or clans, each of which is governed by elected "elders" and captains or chiefs who, under the title of *knjez*, are magistrates in time of peace and military commanders in time of war. All these various local dignitaries come together to form the *Skupschtina*, or National Assembly. The language of the Montenegrins is a very pure dialect of the Servo-Illyrian Slavonic. With the exception of some 8,500 Mohammedans and 3,400 Roman Catholics, the people belong to the Orthodox Greek church, which, though formally independent of the prince, is in reality controlled by him. He appoints the bishops of the two dioceses of Cettinje and Ostrog. The communes support the rural clergy. The debt in 1896 amounted to about 1,000,000 florins, and was owed to the Länder bank of Austria. A tariff of about 6% *ad valorem* is levied on imported merchandise. The importation of salt from Sicily, and of petroleum from Russia, are government monopolies. There is no standing army, but as all the inhabitants are trained as soldiers, they form a permanent militia and are easily transformed into an army numbering (in 1896) about 35,870 infantry, and 856 artillery. As soldiers they are hardy and courageous. There is no navy, and the protection of the Montenegrin coast has been intrusted by international agreement to Austria. There is little trade in Montenegro, yet hides, wool, smoked sardines, smoked mutton, goats, cattle, sheep, cheese,

skins, furs, honey, bees' wax, olive-oil, wine, and tobacco are exported in considerable quantities. There are no railways, but in various parts of the country good carriage roads are to be found. Travel between Cattaro and Cettinje, and from Cettinje to Podgoritza and Niksik is made by means of diligences. The only roads throughout the greater part of the country, however, are mere bridle-paths. M. is a member of the postal union and in 1896 had about 280 miles of telegraph wire. It has no currency of its own, employing Austrian currency chiefly.

History.—Montenegro belonged in the middle ages to the great Servian kingdom, but after the dismemberment of the latter, and its conquest by the Turks at the battle of Kossovo (1389), the Mentenegrins, under their prince, who was of the royal blood of Servia, maintained their independence, though compelled to relinquish the level tracts about Scutari, with their chief fortress of Zabliak, and confine themselves to the mountains (1485). In 1516 their last secular prince resigned his office, and transferred the government to the vladika. The Porte continued to assert its claim to Mentenegro, and included it in the pashalic of Scutari; but the country was not conquered till 1714, and on the withdrawal of the Turks soon afterwards, it resumed its independence. In 1710 they had sought and obtained the protection of Russia, the czar agreeing to grant an annual subsidy on condition of their harassing the Turks by inroads, and this compact has, down to the present time, been faithfully observed by both parties. Another part of the agreement was that the archbishop or vladika was to be consecrated by the czar. In 1796 the prince-bishop, Pietro I., defeated the pasha of Scutari, who had invaded Montenegro, with the loss of 30,000 men: and for the next quarter-century we hear no more of Turkish invasions. The Montenegrins rendered important aid to Russia in 1805 against the French in Dalmatia, and took a prominent part in the attack on Ragusa, the capture of Curzola, and other achievements. Pietro II., who ruled from 1830 to 1851, made great efforts to civilize his people, and improve their condition. He established the senate, introduced schools, and endeavored, though unsuccessfully, to put an end to internal feuds, and predatory expeditions into the neighboring provinces. Some Turkish districts having joined Montenegro, the Turks attacked the latter in 1832, but were repulsed. A dispute with Austria regarding the boundary resulted in a war, which was terminated by treaty in 1840. In 1851 the last prince-bishop died, and his successor, Danilo I., separated the religious from the secular supremacy, retaining the latter under the title of gospodar. This step caused the czar Nicholas to withdraw his subsidy (which was renewed, and the arrears paid, by the czar Alexander II.), and the imposition of taxes thus rendered necessary caused great confusion. This was taken advantage of by the Turks, who, under Omar Pasha, invaded the country; but the intervention of the great powers compelled a treaty, Feb. 15, 1853. Danilo went in vain to the Paris conference in 1857, seeking the recognition of Montenegro as independent. In 1860 the Montenegrins excited an insurrection against the Turkish rule in the Herzegovina, which was soon suppressed, and in return they were so hard pressed by the Turks that they were glad to agree to a treaty (1862), by which the sovereignty of the Sublime Porte over Montenegro was recognized. Fresh complications caused Montenegro to declare war against Turkey in Jan., 1875, but a compromise was effected. Montenegro, however, supported the insurrection against Turkey that broke out in the Herzegovina a little later, and in July, 1876, was again at war. The Montenegrins co-operated with the Russians against their hereditary enemy during the war of 1877–78; and the Berlin conference (1878) recognized the independence of Montenegro, and agreed to an important extension of Montenegrin territory. In 1890, Prince Nicholas celebrated the thirtieth anniversary of his accession to the throne. A very close personal and political friendship exists between the reigning house of Montenegro and the imperial house of Russia. On October 24, 1896, Helena, the third daughter of the reigning prince, married Victor Emanuel, prince of Naples.

MONTENOTTE', a small village of northern Italy, 26 miles w. of Genoa, where the Austrians were defeated by the French on April 12, 1796.

MONTEPIN, Xavier Aymon de; French novelist and dramatist; was born March 18, 1824, at Apremont. He first became conspicuous in 1848, as an anti-revolutionary writer, and has since devoted himself to literature. His works of fiction are somewhat sensational, and his plays are melodramatic rather than purely dramatic. Among his best known novels are *Les Chevaliers du Lausquenet* (1847); *Confessions d'un Bohème* (1849); *Les Viveurs de Paris* (1852–6); *Les Marionettes du Diable* (1860); *Les Tragédies de Paris* (1874); *Les Drames de Mariage* (1878); *Le Médecin des Folles* (1879). His more important plays are *Pauline* (1850); *La Sirène de Paris* (1860), and *Le Médecin des Pauvres* (1865).

MONTEREAU, a t. of France, in the department of Seine-et-Marne, at the confluence of the Seine and Yonne, 12 m. e. by s. of Fontainebleau. The manufactures are porcelain, brown pottery, agricultural and other machinery. Here, in 1419, Jean-sans-Peur, duke of Burgundy, was assassinated, at the instigation and in the presence of the dauphin, afterwards Charles VII.; and in the immediate vicinity Napoleon, Feb. 18, 1814, gained his last victory over the allies. Pop. '91, 7479.

MONTEREY, a co. in w. California, between the coast range of mountains on the e. and the Pacific ocean on the w., drained by the Salinas, Carmel, and Benito rivers, and crossed by the Southern Pacific railroad; 3452 sq. m. in 1890; population, 18,637, chiefly of American birth. The surface is intersected by several mountain ranges, and divided into the three great valleys of the Carmel, Benito, and Salinas. San Benito county was set off from the e. part of this county in 1870. Co. seat, Salinas.

MONTEREY', a city in Monterey co., Cal.; on Monterey bay, opening into the Pacific ocean, and on the Southern Pacific railroad; 125 miles s. by e. of San Francisco. It was the scene of the raising of the U. S. flag when the government took possession of the Mexican province of California, and was the first capital of the new state. The city contains the old Spanish mission church and the old custom-house, and has electric lights, street railroads, waterworks supplied from mountain streams, several churches, a bank, and weekly newspapers. Pop. '90, 1662.

MONTEREY', the most thriving city of northern Mexico, capital of the state of Nuevo Leon, on the San Juan, a tributary of the Rio Grande, 240 m. n.e. by n. of Zacatecas. It is well paved and clean, stands on a broad plain, 1626 ft. above sea-level, and is surrounded by beautiful gardens and orchards. Pop. in 1895, 56,855. From its situation its facilities for commerce are great, and it is the entrepôt for the transport of American goods from the Rio Grande to the inland states of Durango and Zacatecas. In the war between the United States and Mexico, Monterey capitulated, Sept. 24, 1846, after a siege of four days, to the American forces under Gen. Taylor.

MONTEREY, Battle of, occurred in the beginning of the war between the United States and Mexico, and is so named from the Mexican city before which it took place. General Zachary Taylor, who had occupied Matamoras on May 18, 1846, and had there been re-enforced, marched southward along the main highway into the interior, and sat down before Monterey, the key of the northern provinces of Mexico, on Sept. 9, with about 6500 men. The city was strongly fortified, and garrisoned by about 10,000 Mexicans under the command of Gen. Ampudia. The bishop's palace, standing on an eminence w. of the town, had also been fortified, and the position was esteemed difficult of capture, if not impregnable, to so small a force as was comprised in Gen. Taylor's army. The attack was opened on the part of the Americans on Sept. 21, and on the following morning a sharp assault was made on the bishop's palace by General Worth's command. That position being taken, after a stout resistance, the city was forced, and a fierce running fight ensued, the Mexicans resisting stubbornly, as the Americans drove them from square to square, to the centre of the city. The battle lasted two days, but on the 24th, Gen. Ampudia surrendered the city and garrison. This being the first success of the American arms, and being achieved under peculiar disadvantages of relative position and number of men, greatly encouraged the United States soldiers, and stimulated them to renewed daring, while it was viewed by the American people as auspicious of a successful conclusion to the war.

MONTE RO'SA, the *Mons Sylvius* of the ancients, is the highest mountain in Europe after Mont Blanc. It is situated in the angle where the w. end of the Pennine meets the Lepontic Alps, and separates the canton of Valais from Italy. The northern portion of the mountain is highest, and forms nine peaks, the highest of which is forked and precipitous, and attains an altitude of 15,215 feet above sea level. Many attempts were made to ascend this peak, but none were successful till 1855. The mountain appears to consist of mica-slate, in some places alternating with gneiss. It is rich in metallic ores, and several mines of gold, copper, and iron are worked. The highest mine is between 10,000 and 11,000 feet above sea-level, and in the region of perpetual snow. Rye ripens up to an elevation of 6,000 feet; and the vine is found as far up as 3,200 feet; but there is a difference of nearly 1000 feet in the altitude of the corresponding vegetation on the n. and s. sides.

MON'TE SAN GIOVAN'NI CAMPA'NA, a t. in Italy, in the province of Rome, 30 m. n. of Gaeta; pop. 5700. It occupies a commanding situation on a hill, and contains many well preserved mediæval edifices. It was once a fief belonging to the house of Aquinas, and the prison of St. Thomas is still pointed out to visitors.

MONTÉ SAN GIULIANO, a t. of the island of Sicily, province of Trapani, situated on a high mountain 4 m. e.n.e. of the town of Trapani. On the mountain (anciently *Eryx*) are the remains of a once famous temple of Venus. Pop. 4000; commune, 22,300.

MONTÉ SANT' ANGELO, a town of southern Italy, in the province of Apulia, 27 m. n.e. of Foggia. It stands on one of the Gargano group of hills, at a height of 2,765 ft., and has numerous fine churches. It is famed for its exquisite honey, gathered from the odoriferous alpine plants of the mountain. Pop. 15,100.

MONTESI'NOS, Fernando, about 1593–1655; b. Spain; went to Peru while a youth, and eventually became a member of the supreme administrative council at Lima. While employed in this capacity he studied the history and archæology of the country, and wrote *Memories Antiquas Historiales del Peru*, which was translated into French in 1849 by Ternaux-Compans. Prescott, the historian, speaks of him as a writer "who shared largely in the credulity and love of the marvelous which belong to an earlier and less enlightened age."

MONTESPAN, Françoise Athénaïs de Rochechouart de Mortimast, Marquise de, 1641–1707; second daughter of the first duke of Rochechouart. She received a good education at a convent, and appeared in society first under the name of Mlle. de Tonnay-Charente, the name of the château where she was born. Beautiful, witty, and fascinating in conversation, she was soon chosen one of the ladies in waiting of the court of Versailles,

where she became a companion of Mlle. de Vallière, who occupied the same position, and was mistress before her of Louis XIV. She married the Marquis de Montespan in 1663, by whom she had a son. It was the queen who was first so fascinated by the charm of her manner that she called the Marquise to be her companion. In 1668, when her age was 27, the monarch openly recognized both her and Mlle. de Vallière as mistresses, and his queen seemed not the less fond of them. Montespan, who was by far the most powerful and ambitious of the two, maintained for ten years a strange control in state affairs, and retained the joint affections of king and queen; often appearing on state occasions in the carriage with the latter. She was admitted by all to be the most beautiful lady of the court. An abundance of fair blonde hair, expressive blue eyes, dark eyebrows, a complexion of exquisite delicacy, a form full and graceful, and "an air that lighted the spot where she appeared," was the inventory of her personal attractions. Her humors as she acquired power became violent and changeable, and her influence declined. During the ninth year of her *liaison*, Mme. de Maintenon, who was in the service of Montespan as governess of her son, and whose more gentle temper pleased the king, began to supplant her, so that in 1679 the king no longer was under her influence. She retained her place at court till 1691. In 1700 she met the king for the last time at court, and soon afterward followed the fashion of the time and became a religious devotee; but not until she had written a tender letter to her husband, begging him to allow her to return to him, and had been refused. By the king she had two sons, the duc de Maine and the compte de Vexin; three daughters, who lived to marry men of title; and two that died infants.

MONTESQUIEU, Charles de Secondat, Baron de la Brède et de, one of the most celebrated authors and political philosophers of France, b. Jan. 18, 1689, at his father's château of Brède near Bordeaux, and descended from one of the most distinguished families of Guienne. In his youth he was a hard student of jurisprudence, literature, and philosophy. His love of the classical authors was so great that at the age of twenty he composed a work intended to show that they did not deserve eternal damnation for being pagans. In 1714 he was appointed a councilor of the parliament of Bordeaux, and two years after, president of the parliament. His first (published) work was his famous *Lettres Persanes* (Par. 1721), in which, in the character of a Persian, he ridicules, with exquisite humor, and clear, sharp criticism, the religious, political, social, and literary life of his countrymen. Although he did not spare the academy in these *Lettres*, he was admitted a member of it in 1728, and would have been admitted sooner if Cardinal Fleury had not objected on the ground of his jests against religion. In 1726 Montesquieu resigned his office in the parliament of Bordeaux, and spent some years in foreign countries. In England he spent two years, during which he was much in the company of Lord Chesterfield, and was treated with the greatest respect by the most distinguished personages. After his return to Brède, he published his *Considérations sur les Causes de la Grandeur et de la Décadence des Romains* (Par. 1734), a masterly review of Roman history, expressed in a sententious, oracular, and vigorous style. It was followed, after a long interval, by his *Dialogues de Sylla et de Lysimaque* (Par. 1748), published under an assumed name, in which the motives and feelings of a despot are skillfully analyzed. In the same year appeared his great work, on which he had been engaged for twenty years, the *Esprit des Lois* (2 vols., Geneva, 1748), in which it was attempted to exhibit the relation between the laws of different countries and their local and social circumstances. It was immensely popular. No fewer than twenty-two editions were published in eighteen months, and it was translated into various European languages. The *Esprit des Lois* is a wonderfully good book, considering the age in which it appeared. Without adopting Voltaire's hyper-eulogistic criticism, that "when the human race had lost their charters, Montesquieu rediscovered and restored them," it may be said that it was the first work in which the questions of civil liberty were ever treated in an enlightened and systematic manner, and to Montesquieu, more than to any other man, is it owing that the science of politics has become a favorite subject of study with the educated public. Montesquieu died at Paris, Feb. 10, 1755. The collective editions of his works are numerous, amongst which may be mentioned the complete and careful ones by Auger (8 vols., Par. 1819), by Destutt de Tracy and Villemain (8 vols., Par. 1827), by Lefebvre (2 vols., Par. 1839), and by Hachette (2 vols., 1865).

MONTEVID'EO, capital, chief city and port of the republic of Uruguay, in South America, is situated on the n. shore of the estuary of the Rio de la Plata (which is here 60 m. wide), and 120 m. e. by s. from Buenos Ayres. It stands on a small peninsula, and is surrounded by a wall and fortifications. The houses are mostly of one story, with flat roofs. The only public buildings worthy of notice are the cathedral and the town-hall. The climate is healthy; but as there are no rivers near the town, water was scarce until a pumping-main brought it from the Santa Lucia, 36 m. distant. The bay or harbor, which is about 3½ m. long by 2 broad, presents excellent facilities for building wharfs, docks, etc., is sheltered from all but the s.w. gales, and averages 16 or 17 ft. in depth. The trade of Montevideo is extensive; the exports consisting of wool, hides, hair, tallow, salt and dried beef, bones, etc.; and the imports of cotton and woolen fabrics, machinery, also flour, wine, spirits, and other provisions. The chief trade is with Great Britain. Montevideo has steam communication with the United States, Rio Janeiro, England and Genoa, and beside these, carries on a considerable trade with France, Brazil,

and the Argentine Republic. The population in 1862 (inclusive of the small suburbs of Cordon and Aguada) was 45,765; and in 1892, 238,080. See URUGUAY.

MONTEZ, LOLA. See LOLA MONTEZ.

MONTEZUMA, a co. in S.W. Col., touching Utah; formed from part of La Plata; about 2640 sq.m.; pop. '90, 1529. It is drained by the east fork of Dolores river and branches of the San Juan, and in the e. and s. contains lofty mountains. Co. seat, Cortez.

MONTEZUMA, the name of two of the emperors of Mexico.—Montezuma I., the most able of the Mexican emperors, ascended the throne about 1437, and soon after commenced a war with the neighboring monarch of Chalco, which resulted in the annexation of that kingdom to Mexico. Tlatelolco, Cuihixcas, and Tzompahuacan were next annexed. Some reverses which his arms now suffered led to a confederacy of the Tlascalans and two other powerful tribes against him; but in the war which followed Montezuma's arms were again signally triumphant, and the territories of the conquered tribes increased the domain of the now all-powerful Montezuma. After several other successful wars, he died in 1471.—Montezuma II., the last of the Mexican emperors, before its subjugation by the Spaniards, succeeded to the throne in 1502. He had distinguished himself as a warrior during the reign of his predecessor, and after his accession, carried the terror of his arms to the frontiers of Nicaragua and Honduras. He was at the same time a member of the priestly order, and did not demit his functions on his accession. He devoted his chief attention to the improvement of the laws, and of the internal administration, and displayed his taste for pomp and luxury by the magnificence of his household arrangements, and a profuse embellishment of his capital. This necessitated heavy taxation, which, combined with the strictness of his administration, led to continual revolts among his subjects, especially those who had lately come under his sway. When Cortes landed in Mexico with his small army in 1519, Montezuma, blinded by an old prophecy, and by the strange appearance of the invaders, acknowledged them as beings of a superior order, and as his masters (see CORTES). The inhabitants of Mexico having risen against Cortes, the latter caused Montezuma, who was then his prisoner, to appear in order to pacify them; but being wounded accidentally by a stone flung from amongst the crowd of his own subjects, he so keenly felt the indignities which he had suffered, that he repeatedly tore the dressing from his wound, and soon after died, June 30, 1520. Some of his children adopted the Christian religion, and his eldest son received from Charles V. the title of count of Montezuma. One of his descendants was viceroy of Mexico from 1697 to 1701. His last descendant, Don Marsilio de Teruel, count of Montezuma, was banished from Spain by Ferdinand VII., and afterwards from Mexico on account of his liberal opinions, and died at New Orleans in 1836.

MONTFAUCON, BERNARD DE, 1655–1741; b. Languedoc, of noble family. Educated for a military life, but ill-suited to it, he joined the Benedictine order in 1676, studied till 1687, and was then called to Paris, where his profound knowledge of Hebrew and Chaldaic brought him an appointment to study the libraries of France and Italy in the interest of church history. His numerous works are mostly in Latin.

MONTFERRAT, formerly an independent duchy of Italy, between Piedmont, Milan, and Genoa, now a part of the Italian province of Turin. It consisted of two separate portions, Casale and Acqui, lying between the maritime Alps and the Po, and having an area of over 1300 sq. miles. The capital was Casale. Montferrat, after the downfall of the Frankish empire, was ruled by its own margraves till the beginning of the 14th century. This illustrious house for a long time disputed the sovereignty of Piedmont with the house of Savoy, and sent to the crusades more heroes than any other sovereign house in Europe. Members of the family ruled simultaneously in Montferrat, Thessaly, and Jerusalem. On the death of the marquis John I., in 1305, his sister, Iolande or Irene, who was empress of Constantinople, succeeded to Montferrat; and her second son became the founder of the family of Montferrat-Palæologus, which became extinct in 1533, and Montferrat passed to the Gonzagas of Mantua. In 1631 the dukes of Savoy obtained possession of a portion of Montferrat, and in 1703, with the consent of the German emperor, the remaining portion passed under their sway, and was incorporated with their own dominions.

MONTFORT, the name of a noble French house, descended, according to the most probable opinion, from Baldwin, count of Flanders, and Judith, daughter of Charles the Bald. AMAURI 2d, seigneur de Montfort (a little town between Paris and Chartres) is the first of the family mentioned in history. He lived in the first half of the 11th century. His son, SIMON 1st, had for his third wife Agnes, daughter of Richard comte de Evreux. He left four sons, of whom only AMAURI 4th had issue. The grandson of this Amauri, SIMON 3d, surnamed the *Bald*, comte de Montfort and Evreux, married Amicie, daughter of Robert de Beaumont, earl of Leicester. His second son was the famous SIMON 4th, comte de Montfort, and earl of Leicester, subsequently comte de Toulouse. This nobleman, so conspicuous in the terrible crusade against the Albigenses (q.v.), was born about the year 1150. In 1198 he went to Palestine at the head of a troop of French knights, but failed in doing anything against the Saracens, and was obliged to return. In 1202 he joined the 4th crusade, which, however, had no religious design

at all (see CRUSADES), in consequence of which Montfort abandoned it. In 1209 he took part in the war of extermination against the Albigenses. He signalized himself by his relentless ferocity, and his brilliant successes, but was killed by a stone at the siege of Toulouse, June 25, 1218.

MONTFORT, SIMON DE, Earl of Leicester, the fourth son of the preceding, was b. in France about 1206. The title of earl of Leicester came to him by his grandmother, Amicie de Beaumont, sister and heiress of Robert earl of Leicester, but he did not directly or immediately inherit it; for, during the reign of king John, it was borne by Ranulf, earl of Chester. Some time after the death of Ranulf, Montfort came to England, and offered his services to Henry III. Already he enjoyed a great reputation as a warrior, and Henry was so highly pleased with the young French noble that he conferred on him the title of earl of Leicester. Little did Henry think that the stranger was to prove against himself a great founder and champion of English constitutional liberty. He married Elinor, sister to king Henry III., and the youthful widow of that earl of Pembroke to whom, more than to any other, the people of England owe magna charta. After this marriage—which was viewed with disfavor by the king—de Montfort became a steadfast advocate of the English charter, and of the liberties of the people. After visiting the east, he was sent by the king to undertake the command of Gascony. In 1257 the king's debts were so great and the rapacity of his foreign relations so unbearable, that the people were in a state of insurrection. The barons assembled, and, under the direction of De Montfort, held the celebrated parliament at Oxford. They passed statutes to enforce the provisions of magna charta. The king swore to observe them, but sent forthwith to the pope praying to be absolved from his oath. The bull of absolution arrived. Henry set his barons at defiance, shut himself up in the Tower, and appealed to Louis of France. England was now in arms. The whole middle class looked up to De Montfort as their champion and leader, and the war began with the battle of Northampton. The wars of the barons, under De Montfort, have been superficially viewed but as the strife of turbulent nobles, who, in the absence of foreign warfare, employed themselves in getting up a contest at home. Later researches, however, have shown that but for the struggles of De Montfort and the barons, the concessions at Runnymede would have been a mere worthless parchment. At Lewes the royal forces were signally discomfited and the king taken captive. A French chronicler, who praises De Montfort as "noble, chivalrous, and the ablest man of the age," expressly adds that he was "backed by the general favor of the people," who at this time were so "unspeakably trampled under foot and deprived of all their liberties." The conditions exacted from the king were, that he should observe magna charta and the charter of the Forests; be moderate in his expenses and grants, until his old debts were paid off, and he was enabled to live on his own property, without oppression of merchants or the poor; and that Englishmen only should be chosen counselors. No new pretensions were introduced, even at this moment of triumph, and the constitutional maxim of respecting the person of the king was carefully upheld. The queen (Elinor of Provence), who was in France, now occupied herself in collecting a large army. To deliberate upon the measures to be adopted at this great crisis, writs were issued to the sheriffs, in 1265, by De Montfort, directing them to return two knights for each county, and two citizens or burgesses for every city and borough; and from this time may be clearly dated the recognition of the commons as an estate of the realm in parliament. Guardians had been appointed by the barons to watch over the execution of Magna Charta, but fifty years of encroachment on the part of the crown convinced De Montfort that a stronger and more enduring security would be to commit the care of constitutional freedom thenceforth to the people themselves, whose interests the barons thus identified with their own. Mr. Blaauw, who, in his *Barons' War*, presents De Montfort almost for the first time in his true character, adds that "it should be an honest pride to us in after-times that English liberty thus owes its birth to the noblest parentage, confidence in the people." A second war broke out, and this time the popular cause was weakened by defection and treachery. Prince Edward (afterwards Edward I.) encountered the barons at Evesham, with a greatly superior army. When defeat was inevitable, the great leader refused to flee. He "fought stoutly like a giant for the liberties of England," but fell (Aug. 4, 1265) overwhelmed by numbers. The death of De Montfort filled the whole land with mourning. Like Cromwell, whose career in many respects resembles his own, he was denied a grave by the royalists, his head being sent to Wigmore castle, and his mutilated limbs to different towns; but the people bewailed their dead champion, and the clergy pointed to his glorified spirit in heaven. The influence of De Montfort was felt after his death. No baron was executed for bearing arms against his sovereign, and although the Oxford statutes were formally rescinded, their spirit remained. See *Life*, by M. Creighton (1876); and *Simon de Montfort*, by Pauli, translated by Una M. Goodwin (1876).

MONTGOLFIER, JACQUES ÉTIENNE and JOSEPH MICHEL, two brothers, distinguished as the inventors of the first kind of balloons (q. v). They were the sons of a celebrated paper-manufacturer at Annonay, in the department of Ardèche, and early engaged themselves in the same branch of industry. Étienne (b. 1745), after a few successful experiments with the balloon, repaired to Paris; but, though his discovery created a great sensation, and was followed out in practice by many eminent men, he obtained little

pecuniary aid in carrying on his experiments, and at length retired to his native town, where he resumed the manufacture of paper, and died at Servières, in 1799. — His elder brother, Joseph (b. 1740), the sharer of his labors and his glory, was a man of much genius and little education; but the two brothers were fitted to supplement each other's deficiencies, and together they made many discoveries, and were both received as members of the French academy. Joseph invented the hydraulic screw, the calorimeter, etc., and in the latter part of his life filled a post in the department of arts and manufactures. He died at Paris in 1810.

MONTGOMERY, a co. in s.e. Alabama, intersected by the Tallapoosa river, bounded n.w. by the Coosa and Alabama, and drained by many creeks; the Georgia and Alabama, the Alabama Midland, and other railroads pass through it; 772 sq. m.; pop. '90, 56,172, includ. colored. The surface is rolling or even, and very fertile; Indian corn, cotton, and sweet potatoes are the staples; of cotton the annual product is over 25,000 bales, and it is the largest cotton-producing county in the state. Co. seat, Montgomery.

MONTGOMERY, a co. in w. central Arkansas, drained by Ouachita river, Caddo creek, and their many branches; 834 sq. m.; pop. '90, 7923, includ. colored. The surface is rugged and mountainous; the main ridge is called Crystal mountains, and there are found quantities of rock crystals. The soil is not very fertile; tobacco, wheat, Indian corn, and cotton are the staples. The forests are very extensive; lead and limestone are found in considerable amounts. Co. seat, Mount Ida.

MONTGOMERY, a co. in s.e. central Georgia, intersected by the Oconee river, and bounded n.e., s. and s.w. by the Pendleton, Altamaha, and Ocmulgee rivers; 763 sq. m.; pop. '90, 9248, includ. colored. The surface is level and mostly covered with forests; soil light and sandy; chief products: cotton, wool, sweet potatoes, oats, and Indian corn. Co. seat, Mount Vernon.

MONTGOMERY, a co. in s.w. central Illinois, drained by Shoal creek and its branches; intersected by the Cleveland, Cincinnati, Chicago, and St. Louis railroad; about 702 sq. m.; pop. '90, 30,003, chiefly of American birth. The surface is partly woodland, abounding in oak, hickory, etc., and partly prairie; the soil is very fertile, and all the cereals are raised in large quantities; bituminous coal is found. Co. seat, Hillsboro.

MONTGOMERY, a co. in w. central Indiana; drained by Sugar creek, a branch of Wabash river, and two or three other creeks; intersected by several railroads having their terminus at Crawfordsville, among which are the Louisville, New Albany and Chicago, and the Cleveland, Cincinnati, Chicago, and St. Louis; about 504 sq. m.; pop. '90, 28,025, chiefly of American birth. The surface is level or moderately hilly, and is fairly fertile; the staples are wheat, oats, Indian corn, hay and pork. There is much woodland, the sugar maple abounding. Co. seat, Crawfordsville.

MONTGOMERY, a co. in s.w. Iowa, drained by the sources of the Nodaway and Nishnabatona rivers; intersected by the Kansas City, St. Joseph, and Council Bluffs, and the Burlington route railroads; 432 sq. m.; pop. '90, 15,848, chiefly of American birth. Surface rolling and fertile; staples: wheat, Indian corn, hay, and pork. Co. seat, Red Oak.

MONTGOMERY, a co. in s.e. Kansas, drained by the Elk, Fall, and Verdigris rivers; intersected by the Atchison, Topeka, and Santa Fé railroad; 648 sq. m.; pop. '90, 23,104, chiefly of American birth, the number having more than doubled since the census of '70. The surface is mostly prairie, but there is some woodland; wheat, oats, and hay are staples; cattle breeding is extensively carried on. Co. seat, Independence.

MONTGOMERY, a co. in n.e. central Kentucky, drained by branches of Licking river, and intersected by the Chesapeake and Ohio railroad; 200 sq. m.; pop. '90, 12,367, includ. colored. The surface is broken and hilly, and the soil fairly fertile; wheat, oats, potatoes, hay, butter and pork are the chief products. Co. seat, Mount Sterling.

MONTGOMERY, a co. in w. Maryland, having the state line of Virginia for its s.w. and s. boundary, the District of Columbia for its s., the Potomac river on the s. and w. and the Patuxent river on the n.e.; 508 sq.m.; pop. '90, 27,185, chiefly of American birth. 9151 colored. It is drained by Seneca and Rock creeks. It is intersected by the metropolitan branch of the Baltimore and Ohio railroad, and the Chesapeake and Ohio canal is on the s.w. border, following the course of the Potomac. Its surface is hilly; it has forests of pine and hardwood timber, and quarries of stone used for building purposes; other mineral products are gneiss and serpentine. Its soil is fertile along the river banks, producing wheat, rye, corn, oats, potatoes, and dairy products. Live stock is raised to some extent. Co. seat, Rockville.

MONTGOMERY, a co. in. n. central Mississippi, drained by the Big Black river, and intersected by the Illinois Central and the Southern railroads; about 395 sq. m.; pop. '90, 14,459, includ. colored. The county was set off from Choctaw and Carroll counties in 1872. The surface is level, and there are large forests, mostly of oak, cypress, and magnolia trees. Cotton is raised in large quantities. Co. seat, Winona.

MONTGOMERY, a co. in e. central Missouri, drained by the Cuivre and Lautre rivers, branches of the Missouri, which bounds it on the s.; intersected by a branch of the Wabash railroad; about 546 sq. m.; pop. '90, 16,850, chiefly of American birth. The surface is very hilly and for the most part covered by extensive forests. Wheat, corn, oats, and tobacco are raised; limestone, iron, and bituminous coal are found. Co. seat, Danville.

MONTGOMERY, a co. in the eastern part of central New York, on the Erie Canal and the New York Central and Hudson River railroad; about 396 sq. m.; pop. '90, 45,699. Most of its land is fertile, producing wheat, Indian corn, and oats. The chief industries are the manufacture of agricultural implements. Co. seat, Fonda.

MONTGOMERY, a co. in s. central North Carolina, drained by the branches of the Yadkin river, which forms its w. boundary, and intersected by the Uharee river and Simmon's Fork; 596 sq. m.; pop. '90, 11,239, chiefly of American birth. The surface is hilly and mostly covered with pine forests. The bottom land about the creeks is fertile and produces Indian corn, wheat, oats, and grass. Gold is found, but not in large quantities. Co. seat, Troy.

MONTGOMERY, a co. in s.w. Ohio, drained by the Miami river, several of its branches, and Mad river; it is traversed by many lines of railroad, terminating at Dayton, of which the most important are the Cincinnati, Hamilton, and Dayton, the Cleveland, Cincinnati, Chicago, and St. Louis, the Dayton and Union, and the Erie; 480 sq. m.; pop. '90, 100,852, chiefly of American birth. The surface is mostly hilly, but not rugged, and is covered in part by forests of hard wood; the soil is extremely fertile, producing wheat, Indian corn, oats, hay, and tobacco; of the last, the annual yield is from three and a half to four million pounds. Limestone of several kinds is found, and the Niagara, or bluish variety, is extensively used for building in Cincinnati and elsewhere. The Miami canal extends from Dayton to Cincinnati, and furnishes abundant water power. The principal manufacturing interests are at the county seat, Dayton.

MONTGOMERY, a co. in s.e. Penn., on the Philadelphia and Reading and other railroads, and the Schuylkill river; 480 sq. m.; pop. '90, 123,290. Its principal products are wheat, rye, and Indian corn; its industries, the manufacture of agricultural implements, carriages, and woolen goods. Co. seat, Norristown.

MONTGOMERY, a co. in n. central Tennessee, adjoining Kentucky; drained by the Red river and the Cumberland, the latter a navigable stream; intersected by the Louisville and Great Southern railroad; about 540 sq. m.; pop. '90, 29,697, includ. colored. Co. seat, Clarksville.

MONTGOMERY, a co. in s.e. Texas, drained by the San Jacinto river, and intersected by the International and Great Northern and several other railroads; 1100 sq. m.; pop. '90, 11,765, includ. colored. The surface is rolling and generally fertile, though there are some sandy plains; corn, sweet potatoes, and cotton are the chief products. Cattle-raising is carried on extensively. Co. seat, Conroe.

MONTGOMERY, a co. in s.w. Virginia, drained by the Staunton and New or Kanawha rivers, the last being its w. boundary, and intersected by the Norfolk and Western railroad; 422 sq. m.; pop. '90, 17,742, includ. colored. The surface is mountainous, the co. being close to the Blue Ridge; there are extensive forests; and in the valleys, wheat, Indian corn, oats, and pork are the staples. Limestone is found. The climate is very healthful and invigorating. Co. seat, Christiansburg.

MONTGOMERY, city, capital of Alabama, and co. seat of Montgomery county; on the Alabama river and the Central of Georgia, the Georgia and Alabama, the Louisville and Nashville, the Plant system, and the Western of Alabama railroads; 95 miles s.e. of Birmingham. It is at the head of navigation on the river, and has steamboat communication with Mobile at all seasons. The city was laid out in 1817, and named after Gen. Montgomery, who fell at Quebec; was incorporated in 1837, and succeeded Tuscaloosa as the capital in 1847. In 1861–62 it was the seat of the confederate government, but was evacuated by the confederates in 1865, and occupied by federal troops. The city contains many spacious old-fashioned residences and large gardens. Its principal buildings are the state capitol, erected in 1851, banks, churches, large cotton storage warehouses, public schools, an orphanage, a home for widows, U. S. government building, city hall, Masonic temple, and city infirmary. There are artesian wells, gas and electric light plants, electric street railways, suburban parks—Riverside and Highland Hill—a narrow-gauge road to the timber district, brick-yards, factories for the manufacture of carriages, wagons, ice, candy, fertilizers, cigars, soap, paper-boxes, vinegar, crackers, cotton factories, oil mills, machine shops, and marble works. Deposits of coal and iron in the vicinity; immense quantities of cotton are exported annually, as well as coal, iron, and timber. There are a public high school for girls, a state normal school for colored pupils, state and supreme court and state board of health libraries, and several daily and weekly periodicals. Pop. '90, 21,883.

MONTGOMERY, Alexander, a Scottish poet who flourished in the reign of James VI. and died in 1610; author of the allegory *The Cherry and the Slae*.

MONTGOMERY, Gabriel, Comte de, a French knight of Scottish extraction, and an officer in the Scottish life-guard of the king of France, was born about 1530. At a tournament given, June 30, 1559, by Henry II. in honor of his daughter's marriage with Philip of Spain, the king insisted upon young Montgomery entering the lists with him. Montgomery reluctantly complied, and the shaft of his broken lance entering the king's visor at the eye, Henry II. was borne insensible from the ground, and so continued for eleven days, when he died. Montgomery, although blameless, left France, and soon after embraced Protestantism in England. On the commencement of the religious wars in 1562, he returned to his native country to support the Protestant cause, and defended Rouen with great bravery. In the third religious war, he was one of the leaders of the Protestants, and gained many advantages over the royalists in Languedoc and Béarn. During the massacre of St. Bartholomew he happened to be at Paris, and owed his escape to the swiftness of his horse, and fled to England. In April, 1573, he appeared off Rochelle with a small fleet, but failed in accomplishing anything, and was obliged to retire. Next year, at the head of a band of Huguenots, he landed in Normandy, and commenced war there; but being compelled at last to surrender the castle of Domfront, he was carried to Paris; and although the gen. to whom he surrendered had assured him of his life, he was beheaded, after long imprisonment, June 26, 1574. Brantome describes him as naturally the most nonchalant and pleasure-loving of men, but that, when once he had mounted his saddle, there was not a more daring or vigilant warrior in all Christendom.

MONTGOMERY, George Washington, born Valencia, Spain, in 1804; died in 1841. He was the son of an American merchant of Alicante, and for many years was United States consul at Porto Rico, Tampico, and other places. He published in Spanish and English a novel, *Bernardo del Carpio*; translated some of Irving's works into Spanish, and wrote *A Narrative of Travels in Central America* (1839).

MONTGOMERY, James, a minor British poet, the son of a Moravian preacher, was born at Irvine, Ayrshire, Nov. 4, 1771, and at the age of seven was sent to the Moravian settlement at Fulneck, near Leeds, in order to complete his education for the Moravian pastorate. At Fulneck the course of study seems to have been too severe in its character for the young poet; the imaginative side of his mind was allowed no recognition and it was only by stealth that he read Cowper's poems and *Robinson Crusoe*. Much of his leisure time at school was employed in the composition of verses and of music, in which he took much delight. In 1789 he ran away, and after four years of various employment, became engaged as clerk to Mr. Gales, editor of *The Sheffield Register*, for which he soon began to write political articles. In 1794 he commenced a newspaper of his own, *The Sheffield Iris*, which he continued to edit till 1825, when he retired. During the period of his editorship Montgomery was twice subjected to fine and imprisonment by government. In 1795 he was fined £20, and sentenced to three months' imprisonment, for printing off some copies of a miserable ballad in which government suspected that sedition lurked, and in 1796 he was fined £30, and imprisoned for six months, for giving an account of a Sheffield riot. He received a government pension of £150 in 1835, and he died at his own house in Sheffield, April 30, 1854. His principal works are: *The Wanderer of Switzerland* (1806); *The West Indies* (1809); *The World before the Flood* (1812); and *The Pelican Island, and other Poems* (1827). A collected edition of his minor poems appeared in 1851; and in 1853 his *Original Hymns for Public, Private, and Social Devotion* closed the series of his publications.

His poems are melodious, full of picturesque description, and the gentlest human feeling. The personages introduced in his poems are, however, only shadows, or touched with the faintest color of character. But he claims a well-defined position among the favorite poets of his country by several of his hymns and minor poems, and by his exquisite verses on Home, which commence the third part of *The West Indies*.

MONTGOMERY, John Berrien, 1794–1873; b. N. J.; entered the navy in 1812, and was a midshipman on the *Niagara* in the battle of lake Erie, Sept. 10, 1813. For his gallantry on this occasion congress gave him a sword and a vote of thanks. He was attached to the squadron commanded by Decatur in the war with Algiers, commanded the *Portsmouth* during the Mexican war, in which he seized lower California and blockaded Mazatlan, and was made a capt. in 1853. He commanded the Pacific squadron in 1860, was commodore in 1862, and rear-admiral in 1866. He was last stationed at Sackett's Harbor, N. Y. He was retired in 1869.

MONTGOMERY, Richard, 1736–75, b. in Ireland, son of Thomas Montgomery, member of parliament for Lifford: educated at Trinity college, Dublin. In 1754 he obtained a commission in the army, came to America with his regiment three years afterwards, and displayed personal courage and military sagacity at the siege of Louisburg and in other actions. In 1760 Gen. Wolfe appointed him adjutant of his own regiment. He took part in the expedition against Havana and Martinique, and shortly after returned to England (1763); resided there for nine years, sold his commission, and again came to America. He settled and married in New York, was a delegate from his county, Dutchess, to the provincial convention of 1775, and soon afterward was commissioned by congress as one of the brig.gens. to command the colonial forces. An invasion of Canada was determined upon and in the same year (1775) Montgomery was made second in command of one of the two divisions sent out under Arnold and Schuyler. The latter was attacked by illness and obliged to return to Albany, leaving Montgomery at the

head of the division. He at once pressed forward and though embarrassed by lack of munitions and food, and by the disaffection of some of his command, had before the end of November captured successively Chambly, St. Johns, and Montreal; thus gaining the mastery over the greater part of the province. In the next month a junction was effected with Arnold before Quebec. The assault of the town was at once resolved upon and on Dec. 31, shortly after midnight, attempted, a snow-fall aiding the concealment of the troops' movements. One division was to direct its attack against the fortifications at the lower end of the town, while the other under Montgomery's command was to scale the cape Diamond bastion. The surprise was complete, the British artillerists retreating after one discharge. Unhappily Montgomery, who was pressing forward at the head of his troops, was instantly killed by this single fire, two of his aids falling with him. The undisciplined colonial troops were overwhelmed at the loss of their leader, and a precipitate retreat ensued. There is little doubt that Quebec would have fallen had it not been for the death of the gallant commander. His conduct and character were eulogized in parliament by Burke, Chatham, and even the bitter tory lord North; congress recognized his services by resolutions of respect and veneration; and by its order a monument was erected in his honor in front of St. Paul's church, New York city, where in 1818 his remains were interred with impressive ceremonies. The "Death of Montgomery" is one of Trumbull's masterpieces.

MONTGOMERY, Robert, a preacher and verse-maker, who has gained notoriety, if not fame, was born at Bath in 1807. He graduated B.A. at Oxford in 1833, M.A. in 1838, and was ordained in 1835. In 1836 he became minister of Percy Street Episcopal chapel, London; he afterward removed to Glasgow, where he preached for four years, but returned to London, and resumed office at Percy street chapel in 1843. He died Dec. 3, 1855. Montgomery's works comprise a large number of volumes in prose and verse, on themes more or less sacred. He is best known by his poems. *The Omnipresence of the Deity* (1828) has passed through 26 editions. But his celebrity may be said to have died with him, and his works have already become part of the lumber of libraries. This result has been brought about to some extent by the judgment which Macaulay passed upon *The Omnipresence* and other works by this author.

MONTGOMERY, Sir Robert, LL.D., b. Ireland, 1809; educated at Foyle college, Londonderry, and in 1828 appointed to the service of the East India company. In 1853 he was appointed judicial commissioner, superintendent of prisons, and director-general of police for the province of the Punjaub. For his services in the Indian mutiny, and in quelling the disturbances in the Oude, of which he had been made chief commissioner in 1858, he was thanked by parliament, and knighted. From 1859 to 1865 he was lieut.gov. of the Punjaub. In 1868 he was made a member of the council for India. He d. 1887.

MONTGOMERY, William Reading, 1801–71; b. N. J.; graduated at West Point in 1825, and was appointed to the infantry. He served on the western and Canadian border, and through the Florida and Mexican wars. He was brevetted major for gallantry at Palo Alto and Resaca de la Palma. At Molino del Rey he led his regiment after the death of its senior officers, and was dangerously wounded. After further service in Texas and the west he resigned from the army in 1855. On the outbreak of the civil war he raised a regiment of volunteers from his native state. For his gallantry at Bull Run he was made a brigadier-general. He was military governor at various times of Alexandria, Annapolis, and Philadelphia; but resigned his commission, from ill-health, in 1864.

MONTGOMERYSHIRE, an inland co. of n. Wales, between Shropshire on the e., and the Welsh cos., Merioneth and Cardigan, on the w. Area, 510,111 statute acres, including district of boroughs; pop. '91, 58,003. The surface is almost wholly mountainous, a large portion consisting of bleak elevated moorlands; but toward the English border there are several warm, fertile, and well-wooded valleys. The Severn, the Vyrnwy, and the Dovey are the principal rivers. The county belongs almost entirely to the basin of the Severn. The mineral wealth of Montgomeryshire is not great, but copper, lead, and zinc are procured, and millstones, slates, and limestone are quarried. On the uplands the soil is poor, and suited principally for mountain pasture; but in the valleys grain and flax are raised. Cattle and sheep, and the pure breed of Welsh ponies called "merlins," are reared. The Welsh-flannel manufacture is extensively carried on in the county. The capital is Montgomery; pop. '91, about 1500, from which the county received its name, and which was so called from Roger de Montgomery, earl of Arundel and Shrewsbury, who in 1093 recaptured the town and castle, which had been wrested during the previous year by the Welsh from the founder, Baldwin, lieut. of the Marches to William the Conqueror and William Rufus. The county sends one member to the house of commons. The county business is carried on at Welshpool and Newtown alternately. There is an excellent trade in cattle and horses. Offa's dike traverses the s.e. corner.

MONTH, originally the period of the moon's revolution round the earth. If this is reckoned from the position of the moon among the stars to her return to the same position, the period is called a *sidereal* month, and consists of 27 days, 7 hours, 43 minutes, 11½ seconds; but if from new moon to new moon, it is longer, being 29 days, 12 hours, 44 minutes, 3 seconds; this is called a *synodic* month (see Moon). The latter period forms

one of the three natural measures of the lapse of time, and, notwithstanding that its efficiency depends on the state of the atmosphere, it ranks next to the day in importance. There are several other periods used by astronomers to which this name is applied, as the *tropical* or *periodic* month (27 days, 7 hours, 43 minutes, 4.7 seconds), reckoned from the moon's passing the equinox till her return to the same point; the *nodal* month (27 days, 5 hours, 5 minutes, 29 seconds), from ascending node to ascending node; the *anomalistic* month (27 days, 13 hours, 18 minutes, 37 seconds), from perigee to perigee; and the *solar* month, which is the twelfth part of a solar year, consisting of 30 days, 10 hours, 29 minutes, and 4 seconds. Distinct from all these is the *civil* or *calendar* month, fixed by law for ordinary purposes, and consisting of a fixed number of days—from 28 to 31—according to the particular month. The calendar months, with the number of days belonging to each, are as follow:

	Days.		Days.
1. January	31	7. July	31
2. February	28	8. August	31
" (leap years)	29	9. September	30
3. March	31	10. October	31
4. April	30	11. November	30
5. May	31	12. December	31
6. June	30		

See also the separate months under their own heads. The names by which the months are designated throughout Christendom were given them by the Romans; and though Charlemagne in the 9th c., and the French directory in the end of last century, attempted to substitute descriptive epithets, the old-established names continue to be preferred.

MONTHOLON, Charles Tristan de, *Comte,* afterwards *Marquis de,* descended from an ancient French family, was b. at Paris, 1782. At the age of ten he entered the navy, but exchanged it for the army in 1798. His rise was rapid. He displayed great zeal on behalf of the first consul in the revolution of 18th Brumaire, in the capacity of *chef d'escadron.* He served in a number of campaigns, and was severely wounded at Wagram. Napoleon made him his chamberlain in 1809. He was made a gen. of brigade in 1814, and appointed to the chief command in the department of Loire. On Napoleon's abdication, Montholon remained in France, but held aloof from the Bourbons. No sooner had the emperor escaped from Elba and landed at Frejus, than Montholon hastened to join him. He was present at Waterloo, and accompanied Napoleon to St. Helena, continuing his devoted attentions to him till he breathed his last, and being named in his will as one of his trustees, spared no exertion to carry its provisions into effect. Along with gen. Gourgaud he published *Mémoires pour servir à l'Histoire de France sous Napoléon, écrits à Ste.-Hélène sous sa dictée* (8 vols., Par. 1823). He afterwards published a work entitled *Récito de la Captivité de Ste.-Hélène* (Lond. 1847). In the proclamations which Louis Napoleon issued on his landing at Boulogne in 1840, Montholon was named chief of his staff, and on this account he was condemned by the chamber of peers to 20 years' imprisonment; but he was afterwards pardoned. He died Aug. 24, 1853.

MONTH'S MIND is the name of a Roman Catholic office for the dead, continued through the period of a month, or repeated at the end of that period; the word *mind* being used in the sense of *remembrance,* which it has not infrequently in the common version of the Scriptures and other old English writings.

MONTHYON. See Montyon.

MONTI, Vincenzo, the great regenerator of modern Italian poetry, was b. Feb. 19, 1754, in the Roman province of Ferrara, and studied in the university of Ferrara. On the termination of his studies he repaired to Rome (1778), where the patronage of friends obtained for him the post of secretary to the pope's nephew. During his abode in Rome he became involved in a bitter squabble with Alfieri, whose fame as a master-tragedian of Italy was then high in the ascendant—a fact which may have been unpalatable to Monti in consequence of the failure of his own dramatic attempts. The assassination of Basville, the republican envoy of France, afforded to Monti a subject for his poem, *La Basvilliana.* His two succeeding poems, the *Musogonia* and the *Feroniade,* contained the bitterest invectives against France and Bonaparte; but on the appearance of a French army before Rome, Monti, with the inexcusable inconsistency which characterized his political conduct throughout, hastened to espouse the cause of France, and to invoke the protection of Bonaparte. Monti was shortly after appointed secretary of the Cisalpine directory; and in 1789 repaired to France, where he undertook the translation of Voltaire's poetical works. On returning to Italy he was appointed professor in the university of Pavia; and in 1805, on Bonaparte being proclaimed king of Italy, Monti was appointed state historiographer. On the fall of the empire Monti became the eulogist of the Austrian possessors of his country. In the midst of all these political vicissitudes, he pursued with vigor his studies of the classics, and accomplished one of his greatest works, the translation of the *Iliad* into Italian verse. Monti died at Milan, Oct. 13, 1828, of an apoplectic stroke, and was sincerely lamented, notwithstanding the many opponents his hasty susceptibility had created in life. The best editions of his works are those of Milan (1825–27, 8 vols.), and his *Opere Inedite e Rare* (Milan, 1832–33, 5 vols.). Monti

had a warm admiration of Dante, and partook, in some degree, of the spirit of the great master. His chief works are distinguished by sustained grandeur of imagery and diction, by daring flights of imagination, and by the delicacy, elevation, and fire of the sentiments expressed. They are too numerous for separate notice, but the best of them rank among the noblest productions of Italian genius.

MONTICELLO, the residence and estate of Thomas Jefferson, in Albemarle co., Va., three miles west of Charlottesville. The mansion, now in a dilapidated condition, stands on the top of a high hill overlooking a large extent of the neighboring country; and, at the time of its completion, about 1774, was one of the finest and most picturesque residences in the south, surrounded by beautiful lawns, groves, and gardens. It was Jefferson's home during sixty years; but shortly after his death his heirs were obliged to part with it.

MONTILLA, a t. of Spain, in the modern province of Cordoba, and 23 m. s.s.e. of Cordoba. It stands on a hillside rising from the south bank of a tributary of the Xenil. Manufactures of coarse linen and earthenware are carried on, and oil-mills are in operation. A famous wine is grown in the vicinity. Montilla is the birthplace of Gonzalo de Cordova, the "great captain." Pop. 13,800.

MONTJOIE ST. DENIS, the war-cry of the old kings of France, said to be as ancient as the days of Clovis, and from which the king-of-arms, Montjoie, who had exclusive jurisdiction in France, derived his title.

MONTLUÇON, a t. of France, department of Allier, is picturesquely situated on a hill on the right bank of the Cher 45 m. n.w. by n. of Clermont Ferrand. It has some coarse cloth manufactures, and trade in corn, wine, and fruits. It has also iron-works and plate-glass manufactories. Pop. '96, 31,595. At a distance of 10 m. are the wells of Néris-les-Bains, celebrated in the time of the Romans—of whom many traces are left—and still much frequented by invalids.

MONTMAGNY, a co. in s.e. Quebec, having for its n. and n.w. boundary the St. Lawrence river at its widest portion, Goose island lying directly n., and the Grand Trunk railroad traversing the n. section on the s. bank of the river; about 623 sq.m.; pop. '91, 14,724. It is bounded on the s.e. by the state line of Maine, and drained by the n.w. branch of the St. John's river in the s. section, flowing s. along the s. base of a range of mountains, and is drained also by the Riviere du Sud in the north. Its surface is hilly, furnishing good pasturage, and its soil is fertile. Forests of hard wood supply building timber, and it has saw and grist mills. Co. seat, Montmagny.

MONTMARTRE. See PARIS.

MONTMÉDY, FORTRESS OF. The t. of Montmédy, in France, is picturesquely located on the river Chiers; pop. about 2,000. It has commerce in grain and wine, and there are manufactures of cheap leathers. It was in the line of the German invasion of France in 1870, and, being a fortified place, was defended with 8 rifled cannon and 65 pieces in battery, and contained a vast supply of munitions of war. It resisted the bombardment of the Germans in September, but succumbed to another attack Dec. 14.

MONTMORENCY, a co. in n.e. Michigan, lower peninsula drained by Black river and Thunder Bay river, 580 sq.m.; organized 1881; pop. '90, 1487. Its surface consists of table-lands, with a sterile soil. It is extensively covered with forests, and contains beds of iron ore. Co. seat, Atlanta.

MONTMORENCY, a co. in the s.e. of the province of Quebec, Canada; n.w. of the St. Lawrence; intersected by the St. Anne and Montmorency railroads; 2,183 sq.m; pop. '91, 12,311, mostly of French descent. Co. seat, Château Richer.

MONTMORENCY, ANNE, first Duc de, Marshal and Constable of France, b. Mar., 1492, belonged to one of the oldest and greatest of the noble families of France. He received, it is said, the name of *Anne* from his godmother, Anne of Brittany. He distinguished himself by his gallantry and military skill in the wars between Francis I. and the emperor Charles V., and was taken prisoner along with his sovereign in the battle of Pavia, which was fought against his advice. He afterwards became the leader of the French government, showing great ability in matters of finance and diplomacy, and was made constable in 1538; but his rough manners made him an object of dislike to many; and the suspicions of the king having been aroused against him, he was suddenly banished from court in 1541, and passed ten years on his estates, till the accession of Henry II., when he came again to the head of affairs. In 1557 he commanded the French army which suffered the terrible defeat of St. Quentin, in which he was taken prisoner. During the minority of Charles IX., Montmorency, with the duke of Guise and the marshal St. André, composed the famous triumvirate which resisted Catharine de' Medici. In 1562 and 1567 he commanded the royal army against the Huguenots, and in both wars gained victories over them, but received a fatal wound at St. Denis, and died at Paris on the following day, Nov. 12, 1567.

MONTMORENCY, HENRI, fourth Duc de, grandson of the famous constable de Montmorency, b. at Chantilly, April 30, 1595. His godfather was the great *Henri Quatre*, who always called him his "son." When he was 17 years of age Louis XIII. made him admiral, and he defeated the Huguenots in Languedoc, and took the isle of Ré from those

of Rochelle. He afterwards gained other victories over them, and in 1630 received the chief command of the French troops in Piedmont, where he defeated the Spaniards, for which he received a marshal's baton. Unhappily for himself he ventured to oppose Richelieu, who had always been his enemy, and espoused the cause of Gaston, duke of Orleans; for this he was declared guilty of high treason, and marshal Schomberg being sent against him, defeated him at Castelnaudary, and took him prisoner. Montmorency, although almost mortally wounded, was carried to Toulouse, sentenced to death by the parliament, and notwithstanding his expressions of penitence, and the most powerful intercession made for him—for example, by king Charles I. of England, the pope, the Venetian republic, and the duke of Savoy—was beheaded, Oct. 30, 1632. Montmorency was distinguished for his amiability, the courtesy of his manners, and valor.

MONTMORENCY, Falls of, at the mouth of the Montmorency river, 9 m. from Quebec, Canada. They are 50 ft. wide and 250 ft. high. They supply Quebec with electricity, and are much visited by tourists. A village of the same name is situated near them.

MONTMORT, Pierre Rémond, 1678–1719; a French mathematician whose birthplace was Paris, and who was a pupil of Malebranche. He contributed to the *Philosophical Transactions* of the Royal Society of London, of which he was a member, an essay "On Infinite Series." He was also a member of the French Academy of Sciences and published *Analytical Essay on Games of Chance.*

MONTORO, a t. of s. Italy, in the province of Avellino, built partly on the slope and partly around the base of a hill, 12 m. n. of Salerno. Pop. 4,721. It forms the central point of several villages, and has large markets and some linen and cloth manufactures.

MONTORO, a pleasant t. of Spain, in the modern province of Cordoba, built on a rocky ridge around which winds the Guadalquivir, 24 m. e.n.e. of Cordoba. It contains one of the best hospitals in Andalusia. Hardly any drinkable water can be obtained within the town. The heights in the vicinity are clothed with olive plantations, and oil is largely exported from this quarter. Woolens and earthenware are manufactured. Pop. 12,600.

MONTOUR, a co. in e. central Pennsylvania; 130 sq.m.; pop. '90, 15,645, chiefly of American birth. The surface is uneven, and crossed from e. to w. by hills and ridges of a considerable height; one of these, Montour ridge, contains limestone and iron ore, which are found also in other parts of the county; rolled and forged iron is largely exported. The n. branch of the Susquehanna flows through the s., and the rest of the county is watered by Big Roaring, Mahanouring and Chillisquaque creeks. The chief staples are oats, Indian corn, wheat, and potatoes. It is on the Delaware, Lackawanna and Western, and the Philadelphia and Reading railroads. Co. seat, Danville.

MONTPELIER, city, capital of Vermont, and co. seat of Washington county; on the Winooski river and the central Vermont and the Montpelier and Wells River railroads; 40 m. s.e. of Burlington. It is about 15 m. e. of Green Mountain range; was made the state capital in 1805; and was chartered as a city in 1895. The city contains the capitol, erected in 1857 and built of granite, with a dome surmounted by a statue of Agriculture; Montpelier public library and Wood art gallery, the Kellogg-Hubbard library, Heaton hospital, Washington county grammar school, Vermont Methodist seminary, U. S. government building of marble, electric light and street railroad plants, and waterworks on the gravity system. The principal industries are granite quarrying and the manufacture of cotton goods, saddlery, hardware, and saw-mill machinery. There are several national, savings, and investment banks, and weekly newspapers. Pop. '90, 4,160.

MONTPELLIER (Lat. *Mons. Pessulanus* or *Puellarum*), city, capital of the French department of Hérault, on the Lez, 6 m. n. of the Mediterranean and 76 m. w.n.w. of Marseilles. Seen from a distance, Montpellier has an imposing appearance, from the number of its towers, steeples, and cupolas; but, although its suburbs are clean and well built, the interior of the old town disappoints expectation, being chiefly remarkable for its crooked, dark, narrow, and dirty streets. The public walks, known as those of the Peyrou, and some of the other more elevated points, afford glorious views, embracing the Mediterranean, the Alps, the Cevennes, and the Pyrenees. The most noteworthy buildings are the cathedral, the theater, the exchange, the hall of justice, the prefecture, the observatory, and the university. The last, which was founded in 1196, is composed of three faculties—that of medicine, founded in the 12th c. by Arabian physicians, and still ranking among the best in Europe—that of the exact, and that of the physical sciences. Montpellier has a botanical garden, the oldest in Europe; a public library of 100,000 volumes, and a pharmaceutical school; admirable museums, natural history and fine art collections, etc. The industrial products of Montpellier are pigments and other chemical preparations, brandy, liqueurs, perfumes, soap, corks, sugar, cotton, woolen, and fine leather goods; and the trade, which is very important, includes, besides these articles, wine, seeds, olive-oil, and fruits. Railways to Marseilles, Cette, and other ports, besides various canals, facilitate commercial and social intercourse, and few cities of the empire hold out greater attractions in regard to intellectual culture than Montpellier. Its geographical position has led to its being selected as a place of residence for consumptive patients; but the extreme clearness and even sharpness of the air in the more elevated parts of the town, the occasional occurrence of the icy wind known as the

mistral, and the sudden accession of overpowering heats, would seem very materially to counteract some of its long reputed advantages. Pop. '96, 73,931.

MONTPENSIER, Anne Marie Louise d'Orléans, Duchesse de, 1627–93; niece of Louis XIII. of France, known as *grande mademoiselle;* one of the richest princesses of her time, ambitious, and beautiful. Though 11 years older than the dauphin, afterward Louis XIV., she sought to marry him, but failed. Charles II. of England when driven from his throne was a refused suitor for her in marriage. In 1649 she placed herself with Condé at the head of the rebellion of the Fronde, and meeting with some transient success endeavored to make it the basis of claims on the hand of Louis XIV. Condé found in her wealth and resolution his most powerful auxiliary. Jointly they were at one time in possession of Paris, installed in the Hotel de ville, while Louis XIV. was obliged to fight for possession of the capital. While the battle was going on, July 2, 1652, in the faubourg St. Antoine between the troops of Condé and those of the king, the former was saved from defeat by Mlle. Montpensier, who ordered the guns of the Bastille to be turned against the king's troops, and with her own hand fired the first gun. In the excesses against the royalists which followed Condé's success in Paris, Mademoiselle was conspicuous for her humane efforts to put a stop to cruelties. On the re-entry of Louis XIV. into Paris, she retired to her estates for five years and dictated *Mémoires.* In 1657, at the age of 30, she was permitted to return to court, where she soon became ridiculous by falling in love with a young cadet named Lauzun, who was put in the Bastille by Louis XIV. on account of his dangerous blandishments. At the age of 42 Mademoiselle offered her hand and heart to the same youth, the king consenting to the marriage; but the consent was withdrawn before the ceremony could take place; Lauzun was sent away and afterward placed in the Bastille for ten years. It is supposed, however, that they had been secretly married, and that this was the pretext on which the king exercised his authority for their separation. When Mademoiselle was 52 years old the marriage was consummated, but Lauzun was then become a miserable wreck of former beauty, and the match was altogether unhappy. It is said that Lauzun's release from prison was bought by Montpensier by the settling of large estates on bastard sons of Louis XIV. by Mme. de Montespan. The brutality of Lauzun soon necessitated a separation, and she subsequently devoted herself to religious exercises. The *Mémoires* were published in Amsterdam in 1786 in 8 volumes. A Paris edition of these and other works from her pen was published by *Chéruel* in 1858.

MONTPENSIER, Antoine Marie Philippe Louis d'Orléans, Duc de, b. France, 1824, fifth son of Louis Philippe. He was educated at the college of Henry IV., and went to Africa in 1844 as lieut. in the artillery, receiving a wound in the Ziban campaign. After a tour in the east he married, in 1846, the infanta Marie Louise de Bourbon, sister of queen Isabella II. The marriage created great excitement, Louis Philippe being generally credited with an intention to seat his son upon the throne of Spain. During the revolution of 1848, the duke resided in England, but soon returned to Spain, taking up his residence at Seville. In 1859, he was appointed capt.gen. of the Spanish army. During the political agitation, before the flight of Isabella, the duke quitted Spain at the request of the ministry, at the same time resigning his position in the army, and the title of infante. Returning to Spain, under the provisional government, he offered himself as a candidate for the throne, but destroyed his chances for election by a duel with his cousin, the infante Don Enrique de Bourbon, whom he killed March 12, 1870. He was court-martialed and sentenced to one month's banishment from the capital. He d. 1890. His eldest daughter, Marie, was married to the comte de Paris, in 1848; and his third daughter, Maria de las Mercedes, married her cousin, Alfonso XII., in 1878, and died June 26 of the same year.

MONTREAL, an island formed at the junction of the Ottawa with the St. Lawrence river, 30 m. long, 10 m. at its greatest breadth, containing 197 sq. miles. Undulations, called *Coteaux*, culminate in Mount Royal. The island is divided into two jurisdictions—the eastern *Hochelaga*, the western *Jacques Cartier*—each being represented in parliament.

MONTREAL (Mont Royal), the largest city in the Dominion of Canada, 180 m. s.w. of Quebec, 420 m. n. of New York, and 620 m. from the sea, on the s.e. side of Montreal Island, occupying a low tract of land, about 2 m. wide, between the St. Lawrence river and a mountain, which gives a picturesque background to every view of the city. Its summit is reserved for a public park of 460 acres, in beautiful cultivation, and the streets lie upon its slope in terraces. Those in the lower part of the town are narrow, irregular and dingy. The chief business streets are St. James, St. Paul, St. Lawrence, McGill, Bleury, Craig, Notre Dame and St. Catherine, the latter once an aristocratic center. Notre Dame is the main street, extending along the centre of the ridge on which the city is built, but St. James street is wider and more elegant. The residences of the wealthy lie on the slopes of Mont Royal. The French occupy the eastern quarter, the dividing line being St. Lawrence street. Montreal is about 6 m. long, and contains many public squares, such as Dominion, Victoria (containing a fountain and statue of the queen), St. Louis and the Viger Gardens, ornamented with shrubbery, flowers and fountains.

Montreal's first record dates from 1535, when Jacques Cartier ascended the St. Lawrence and found an Indian village named Hochelaga, which lay at the foot of the mountain, and whose name is still preserved in a portion of the modern city. It was inhabited by the Hochelaga, or Beaver Indians, active traders, who traversed the St. Lawrence from their district to Ottawa. When Champlain visited the spot, in 1603, the Indian town had vanished, as the result of a war between the Hurons and the Iroquois; and here he established, eight years later, a trading-post. In 1642 Paul de Chomedy, Sieur de Maisonneuve, for "La Compagnie de Montréal," founded the "*Ville-Marie-de-Montréal*" on romantic ideas of religion and patriotism. The town was engaged in struggles with the Iroquois for many years, and in 1665 the Marquis de Tracy arrived from France with the famous Carignan-Salières regiment, which broke the power of the red men. In 1672 the town became the centre of the fur trade and the starting point for military and exploring expeditions, for which it became known as the "Mother of Cities." With Indian massacres and warfare, and strife between the religious and civil authorities of Quebec, Montreal soon acquired a romantic history; and in 1760 the British entered and marked a new era. In 1775–6 it was occupied by troops of the Continental Congress, under Montgomery; but the citizens resented Franklin's attempts for revolt against British rule. Since then the city has had continued growth and prosperity. In 1844 it was made the seat of Canadian government, but it lost the honor after the riot of 1849, when the Parliament buildings were destroyed by the mob. The British garrison was removed in 1870. The buildings, adorned with lofty towers and spires, are chiefly of grey limestone, quarried in the vicinity, and include Notre Dame, built in 1824 opposite the site of an earlier church (1672), one of the largest cathedrals in America, being 255 feet long by 145 feet wide, capable of holding over 10,000 people. Its towers are 220 feet, with a noted chime of bells. Near it is the seminary of St. Sulpice, the oldest building in Montreal (1684). Other important edifices and places of interest are the court-house, city-hall, custom-house, the old Château de Ramezay (1705), for a time the official residence of the British governors, and headquarters of the American general and commissioners in 1775–6; the Champ-de-Mars, the old parade ground of the British troops; Jacques Cartier square, with statue of Nelson (1808); the church of St. Gabriel, oldest Protestant church (1792); Bonsecours market, 500 feet long; the church of Notre Dame de Bon Secours; St. Patrick's church; the cathedral of St. James, known universally and erroneously as St. Peter's, a reproduction on a small scale of St. Peter's in Rome (1868); Christ church cathedral, Episcopal, a fine example of Gothic architecture; St. James Methodist church; Church of Notre Dame de Lourdes (1874); the Jesuit church, noted for its frescoes; St. Andrew, St. Bartholomew, St. Paul's, St. George, Erskine Presbyterian, and Church of the Messiah. Among other points of interest are the Fraser institute, a public library and art gallery; the Protestant and Roman Catholic deaf and dumb asylums; the asylum for the blind; and the great convent of the Holy Names of Jesus and Mary. The most important educational institution is McGill university, founded in 1824 by a bequest of James McGill, also containing the Redpath library and a natural history museum. There are Presbyterian, Wesleyan and other colleges; the collège de Montréal; a French school of medicine and surgery; the Fraser institute; Grey Nunnery, a hospital and orphan asylum; Nazareth Asylum for blind children; the Hôtel de Dieu, founded in 1644 by Mlle. Mance, an original settler of Montreal; the Royal Victoria, the Montreal general, and the Western hospitals; and the Victoria Rifles armory. There are many libraries, schools and academies, and an art gallery. The publications include daily, weekly, monthly and quarterly papers and magazines, printed in French and English, the principal ones being *The Gazette*, founded in 1778, continuous since 1795 (Conservative), *Herald* (Liberal), *Star*, *Minerve*, *Le Monde*, *Witness*, *Patrie* and *Presse*.

Montreal's wealth was obtained early by the fur, lumber and grain trade of the Northwest, and now she is the metropolis of Canada, being her chief port of entry, lying at the head of ocean navigation, and also commanding the great rivers, lakes, and canals, and the extended railway communication to the West. The Lachine canal was opened in 1825, the Grand Trunk railway in 1852, the Allen Line of ocean steamers in 1856, the Victoria bridge over the St. Lawrence, costing nearly $7,000,000, in 1854–9, the Champlain and St. Lawrence railway, from Laprairie to St. John's, in 1886, and the Canadian Pacific the same year. Various steamships run to transatlantic ports, and many railway lines connect it with all parts of Canada and the United States. The exports and manufactures are lumber, grain, flour, cattle, apples, butter, phosphates, cheese, boots, shoes, beer, tobacco, sugar, tools, silk, cotton, woollens, soap, candles, hardware, glass, carriages, sleighs, drugs, paints, corn-brooms, steam-engines, locomotives, boilers, printing-presses, sewing-machines, agricultural implements, musical instruments, paper, rope, types, pins, etc. There are also saw, flour and rolling mills, brass, and iron foundries, lead works, etc.; and gas and electric light plants, electric street railroads, a costly system of waterworks, and unsurpassed wharves built of limestone. The harbor is annually undergoing improvement to accommodate the increase of shipping. There are many banks, the bank of Montreal claiming to have the largest capital of any bank in North America, and to rank as the fifth in the British empire. The climate is extreme, reaching 90° in summer, and sometimes 20° below zero in winter. The winter carnivals attract thousands of visitors to engage in the gay skating tournaments, the snow-shoe parades, the masquerades, the tobogganing and the storming of the ice castle, generally

erected in Dominion square, by torchlight, amid the display of gorgeous pyrotechnic devices. With her suburbs, Montreal's population numbered in 1891, 216,650, half being French, the rest Irish, English and Scottish. Three-fourths of the inhabitants are Roman Catholics, and the city is the seat of both Roman and Anglican bishops. Montreal is thus a type of the entire Dominion, where the English and French Canadian influences lie side by side in perpetual contact, yet preserve their unbroken individuality.

MONTREUX, a village in the canton of Vaud, Switzerland, on lake Geneva, 15 m. e.s.e. of Lausanne on the bay of Montreux; pop. about 2000. The M. district contains a number of villages, including Clarens, Territet, Vernex, Colenges, Glion, Veytaux and others.

MONTROSE, a western co. of Col., touching Utah, formed 1883 from part of Gunnison co.; pop. '90, 3980. It is drained by the Gunnison and Dolores rivers, and crossed by the Uncompahgre range. The Denver and Rio Grande railroad passes through. Area, 2300 sq. m. Co. seat, Montrose.

MONTROSE', a royal and parliamentary burgh and seaport on the e. coast of Scotland, in the county of Forfar, and situated at the mouth of the river South Esk, about 80 m. n.e. of Edinburgh, and 34 m. s.w. of Aberdeen. It stands on a level peninsula between the basin of the Esk (an expanse 7 m. in circumference, and dry at low water) and the mouth of the river. A fine suspension bridge, 432 ft. long and 26 ft. broad—erected in 1828-29 at a cost of nearly £20,000—connects the town with Rossie island, which is again connected with the mainland by a small drawbridge. The royal lunatic asylum was opened in 1868 at a cost of upwards of £30,000. Between the town and the shore are the "links" or downs, among the finest in Scotland for golfing or cricketing. Two lighthouses stand in a line on the n. bank of the river, about 400 yards apart; while a magnificent tower, named the Scurdyness lighthouse, erected by the board of trade in 1870 at a cost of nearly £2,700—exhibiting a clear white light, visible at nearly 20 m. distance—stands at the mouth of the river. The harbor is provided with quays and dry and wet docks. It affords accommodation to vessels drawing about 19 feet of water, and is one of the best harbors on the eastern coast. Flax-spinning is the chief manufacture of the town, and there is also a large saw-mill giving employment to a considerable number of workmen. Fish curing is also an important industry there. The city was the birthplace of many distinguished men, among them Robert Brown, Joseph Hume, Andrew Melville, Paul Chalmers, and the Marquis of Montrose. It was chartered in the 12th century by David I. and in the middle of the 14th century was made a royal burgh. Pop. '91, 14,400.

MONTROSE, James Graham, first marquis of, belonged to a family that can be traced back to the year 1128. Its first notable member was sir John Græme of Dundaff, who fell at the battle of Falkirk, July 22, 1298. Early in the 15th c., sir William Graham married for his second wife a daughter of Robert III. Robert, the eldest son of this marriage, was ancestor of the Grahams of Claverhouse. The third lord Graham, created earl of Montrose by James IV., fell at Flodden; his eldest son at Pinkie. The next in succession became viceroy of Scotland after James VI. had ascended the throne of England. His eldest son, John, who succeeded to the earldom in 1616, married lady Margaret Ruthven, eldest daughter of William, first earl of Gowrie, and sister of the unfortunate nobleman who gives name to the *Gowrie Conspiracy*. The issue of this union was five daughters and one son, James, the "great marquis," who was born in 1612, according to tradition, in the town of Montrose. His mother died in 1618, his father in 1626. In the following year, the boy was sent to the university of St. Andrews by his guardian and brother-in-law, Archibald, lord Napier, son of the famous inventor of logarithms. He was an apt, if not an ardent student, and during the two or three sessions of his attendance at college, acquired a very respectable amount of classical knowledge, besides exhibiting a genuine predilection for literature, which the stormy character of his after-life never quite destroyed. In his 17th year, he married Magdalene Carnegie, daughter of lord Carnegie of Kinnaird, on which occasion he had his portrait painted by Jameson, the pupil of Van Dyck. For the next three years he lived quietly at Kinnaird castle, pursuing his studies. On attaining his majority, he left Scotland, to travel on the continent, visited the academies of France and Italy, and perfected himself in all the accomplishments becoming a gentleman and a soldier. On his return, he was introduced to king Charles I., but owing, it is said, to the machinations of the marquis of Hamilton, was coldly received by that monarch, and had no sooner reached Scotland, than he joined the ranks of the king's opponents, which at this period comprehended the majority of Scotchmen. Montrose came back in the very year (1637) when the tumults broke out in Edinburgh on the attempt to introduce the prayer-book. Whether his conduct at this moment was the result of chagrin, or whether he was carried away by the prevailing enthusiasm, or by the persuasions of craftier persons than himself, is difficult to say. Baillie speaks of his having been "brought in" by "the *canniness* of Rothes," a phrase which appears to Mr. Mark Napier to indicate that he was trepanned with difficulty into joining the league. At any rate, the youthful nobleman soon became to appearance one of the most zealous of the covenanting lords. He was one of the four noblemen selected to compose the "table" of the nobility, which, along with the other tables of the gentry, of the burghs, and of the ministers, drew up the

famous national covenant (see COVENANTS), sworn to by all ranks at Edinburgh in the spring of 1638. Montrose was appointed in the following summer to agitate for subscriptions in Aberdeenshire, where the influence of the marquis of Huntly was exercised on the side of the king. He did not, however, meet with great success. In 1639, he made three military expeditions to Aberdeenshire to overawe the royalists. The latter were in considerable force under the marquis of Huntly, but owing to the timid, if not treacherous orders of the marquis of Hamilton, then governor of Scotland, they were always forced to disband. Montrose twice took the city of Aberdeen. On the first occasion (March 29), he compelled the inhabitants to subscribe the covenant, but did no injury to the city. His "too great" humanity is even lamented by Baillie. On the second (May 25), he imposed on the city a fine of 10,000 merks; but though his soldiers pillaged the place, he honorably resisted the importunities of the zealots among the Presbyterian clergy, who wished to expose it to the horrors of conflagration. Baillie again complains of his "too great lenity in sparing the enemy's houses." The arrival at Aberdeen by sea of the earl of Aboyne—Charles's lieutenant of the north—with some re-enforcements, induced Montrose to retreat, who was followed by the earl and the Gordon Highlanders. At Meagra Hill, near Stonehaven, a battle was fought (June 15) between the two armies, in which Montrose obtained a complete victory; four days later, he was again master of Aberdeen, after a fierce struggle at the passage of the Dee. The citizens were stricken with alarm, expecting some bloody punishment for their well-known Episcopalian leanings, but Montrose agreeably disappointed their fears. At a subsequent period, he was upbraided by the committee of estates for not having burned the town on this occasion. News of "the pacification of Berwick" now arrived in Aberdeen, and terminated the struggle in the north. Charles invited several of the covenanting nobles to meet him at Berwick, where he was then holding his court, and to consult with him about Scottish affairs. Among those who went was Montrose, and the Presbyterians dated what they regarded as his apostasy from that interview. Be that as it may, his political position was certainly different after his return. In the general assembly which met, Aug. 13, 1639, under the presidency of the earl of Traquair, as royal commissioner, he showed symptoms of disaffection towards the covenant, and was the object of much popular obloquy. One night he is said to have found affixed upon his chamber-door a paper bearing these words, *Invictus armis, verbis vincitur*. The dissolution of the parliament, in June 1640, led to an open rupture between the king and the covenanters, and both parties prepared to decide their quarrel by force of arms. The former assembled at York an army of 21,000 horse and foot; the latter another of 26,000, which, under the command of Leslie, crossed the Tweed, Aug. 21, 1640. Montrose was the first man that forded the stream. The successes of the Scots, as is well known, soon forced Charles to summon a new parliament for the settlement of the national grievances. Meanwhile Montrose, along with several other influential nobles, had entered into a secret engagement at Cumbernauld, for the purpose of frustrating what they regarded as the factious designs of the extreme covenanting leaders. His conduct in England, too, had been suspicious. It was accidently discovered that he had been secretly communicating with the king; and when the parliament assembled (Nov., 1640), he was cited to appear before a committee. The affair of the *Cumbernauld bond*, discovered by the ingenuity of Argyle, was brought up; but Montrose defended his conduct and that of his colleagues; and nothing came of it, though some fiery spirits among the clergy, says Guthrie, "pressed that their lives might go for it." In the following June, Montrose and some others were accused of plotting against Argyle, and were confined in Edinburgh Castle, where they remained till the beginning of 1642, when they were set at liberty in return for the concessions which Charles had made his Scottish subjects. Although they had been frequently examined, nothing definite had been proved against them. The accusation that Montrose had offered to the king to assassinate Argyle, is not historically substantiated, and is intrinsically improbable. During the next two or three years, he kept aloof, outwardly, from public affairs, but he had finally broken with the covenanters, and had privately ranged himself on the side of the king. The civil war in England had now broken out, and was being carried on with dubious success. Charles and his advisers resolved to crush the Presbyterian leaders in Scotland, who were abetting the efforts of the English parliamentarians. In the spring of 1644 Montrose now raised to the rank of marquis, left Oxford, where he had been residing with his sovereign, and proceeded to Scotland to raise the royalists in the north. The battle of Marston Moor for a moment paralyzed him, but his resolution speedily returned. He threw himself into the highlands, and after skulking about the hills for some time in disguise, met at Blair-Athol some Irish auxiliaries and a body of Highlanders under Allaster Maccoll Keitache Macdonald, better known as *Colkitto*, who had forced their way thither from the Western Isles in hopes of joining him. Montrose instantly placed himself at their head, and the clans quickly rallied round his standard. Marching south, he fell suddenly (Sept. 1) on the covenanting army commanded by lord Elcho, at Tippermuir, near Perth, and gained a complete victory. Not a single royalist was slain. The same night, Montrose entered Perth, where he remained for three days, levying a fine of 9,000 merks on the inhabitants. He then set out for the north, defeated a force of covenanters under lord Burleigh at Aberdeen (Sept. 13), and took possession of the city, which was abandoned for four days to all the horrors of war. The approach of Argyle,

at the head of 4,000 men, compelled Montrose, whose forces were far inferior in numbers and discipline, to retreat. He now plunged into the wilds of Badenoch, recrossed the Grampians, and suddenly appeared in Angus, where he wasted the estates of more than one covenanting nobleman. Having obtained fresh supplies, he once more returned to Aberdeenshire, with the view of raising the Gordons, narrowly escaped defeat at Fyvie in the end of Oct., and again withdrew into the fastnesses of the mountains. Argyle, baffled in all his attempts to capture or crush Montrose, returned to Edinburgh, and threw up his commission.

His opponent, receiving large accessions from the Highland clans, planned a winter campaign, marched south-westward into the country of the Campbells, devastated it frightfully, drove Argyle himself from his castle at Inverary, and then wheeled n., intending to attack Inverness, where the covenanters were posted in strong force under the earl of Seaforth. The "estates" at Edinburgh were greatly alarmed, and raising a fresh army, placed it under the command of Gen. Baillie, a natural son of sir William Baillie of Lamington. After consulting with Argyle, it was arranged that he should proceed by way of Perth, and take Montrose in front, while Argyle should rally his vast array of vassals, and attack him in the rear. The royalist leader was in the great glen of Albin—the basin of the Caledonian canal—on his way to Inverness, when he heard that Argyle was following him. He instantly turned on his pursuer, fell upon him unexpectedly at Inverlochy, Feb. 2, 1645, and utterly routed his forces. Fifteen hundred of the Campbells were slain, and only four of Montrose's men. He then resumed his march northwards, but did not venture to assault Inverness—his wild mountaineers being admirably fitted for rapid irregular warfare, but not for the slow work of beleaguerment. Directing his course to the e., he passed—with fire and sword—through Elgin and Banff into Aberdeenshire, which suffered a similar fate. Baillie, and his lieutenant, Hurry, were at Brechin, but Montrose, by a dexterous movement, eluded them, captured and pillaged the city of Dundee (April 3), and escaped safely into the Grampians. On the 4th of May, he attacked and routed Hurry at Auldearn, near Nairn, and after enjoying a short respite with his fierce veterans in Badenoch, again issued from his wilds, and inflicted a still more disastrous defeat on Baillie himself at Alford, in Aberdeenshire (July 2). There was now nothing to prevent his march s., and about the end of the month, he set out with a force of from 5,000 to 6,000 men. He was followed by Baillie, who picked up re-enforcements on his way, and on the 15th of August again risked a battle at Kilsyth, but was defeated with frightful loss—6,000 of the covenanters being slain. The cause of Charles was for the moment triumphant; Montrose was virtually master of the country. The king formally appointed him lieut.gov. of Scotland, and the commander-in-chief of the royal forces. All the principal cities in the w. hastened to proclaim their fidelity, and laid the blame of the recent troubles on the unfortunate Presbyterian clergy. But affairs soon took a very different turn. Great numbers of the Highlanders returned home—we might even say, deserted—burdened with multifarious plunder; and the earl of Aboyne withdrew with all his cavalry. Montrose's position in a district teeming with enemies, was growing critical, and on the 4th of September he broke up his camp at Bothwell, and marched for the eastern counties, where Charles had informed him that the earls of Traquair, Home, and Roxburgh were ready to join him. In this he was disappointed, and on the 13th of the same month he was surprised at Philiphaugh, near Selkirk, by David Leslie, who fell upon the relics of Montrose's army and his raw levies with 6,000 cavalry—the flower of the Scottish forces then serving in England—who had been hurriedly dispatched home on the news of Montrose's startling successes. Leslie completely annihilated his opponent. "On Philiphaugh," says sir W. Scott, "Montrose lost the fruit of six splendid victories." Escaping from the field of battle, he made his way to Athol, and again endeavored, but in vain, to rouse the Highlands; and at last Charles, now beginning to get the worst of it in the civil war, was induced to order him to withdraw from the kingdom. On the 3d of September, 1646, he sailed for Norway, whence he proceeded to Paris. Here he endeavored, but in vain, to induce Henrietta Maria to bestir herself on behalf of her husband. The queen coldly received all his suggestions, and at last Montrose, in despair, betook himself to Germany, in hope of service under the emperor, but soon after returned to Holland, and entered into communication with the prince of Wales, afterwards Charles II. It was here that news of Charles I.'s execution reached him. Montrose fainted on receipt of the dreadful intelligence, and gave way to the most passionate regrets. Charles II. now re-invested him with the dignity of lieut.gov. of Scotland, and Montrose undertook a fresh invasion, on behalf of the exiled monarch. In March, 1650, he arrived at the Orkneys with a small force, and after the lapse of three weeks, proceeded to Caithness; but neither the gentlemen nor the commons would rise at his call. He forced his way as far s. as the borders of Ross-shire, where his dispirited troops were attacked and cut to pieces at a place called Corbiesdale, near the pass of Invercarron, by a powerful body of cavalry under Col. Strachan. Montrose fled to the wilds of Assynt, where he was nearly starved to death, when he fell into the hands of M'Leod of Assynt, who delivered him up to Gen. Leslie, by whom he was brought to Edinburgh. Condemned to death as a traitor to the covenant, he was executed, May 21, 1650. His demeanor in his last moments was very noble and dignified.

MONTS, Pierre du Guast, Sieur de, 1560–1611; b. in France of an Italian family, became a Protestant, and a favorite of Henry IV., a protégé in the royal household and governor of French provinces. In 1603 the king made him governor of the French company of Canada, which was given exclusive right to trade in furs between 40° and 50° n. lat., the right to make land grants and govern the country, under the name of Acadia, with the title for himself of vice-admiral and lieut.gen. Taking with him Samuel Champlain, Poutrincourt, Biencourt, and Pontgravé as chief officers, he sailed from Havre, March 7, 1604. He made Poutrincourt governor of Port Royal, explored the bay of Fundy, made Tadoussac in the St. Lawrence his fur trade depot, and returned to France. There he found his monopoly had excited such lively opposition that his privileges had been withdrawn. But he succeeded in recovering a part on more specific conditions and returned to Canada, where Champlain, one of his officers, founded the city of Quebec in 1608, and his fur trade became profitable. After Henry IV. was assassinated Monts's privileges were taken away, to his financial ruin. Charlevoix mentions Monts as a thoroughly honest man, of capacity and straightforwardness, fitted to succeed in any enterprise of a commercial character. He died in Paris.

MONTSERRAT, one of the lesser Antilles, belonging to Britain, lies 34 m. n.w. of Guadeloupe, and at a similar distance from Antigua and St. Kitts. It is about 11 m. in length, 5 in breadth, and contains an area of 37 Eng. sq. miles. The population in 1891 was 11,762, only 204 of which were white. About two-thirds of the surface is mountainous and barren, the rest is well cultivated. The chief products are sugar, limes, rum, and molasses: but cotton, arrow-root and tamarinds are also exported. The island forms a portion of the government of the Leeward isles, and is directly ruled by a president, aided by a council and house of assembly. The chief town is Plymouth, on the s. coast. The legislature consists of the commissioner and a legislative council of not more than six members who are appointed by the crown, and an executive council appointed by the sovereign. The island was discovered by Columbus in 1493, and after being held by France for a short time was restored to the English in 1784.

MONTSERRAT (Lat. *Mons Serratus*, so named from having jagged ridges *like the teeth of a saw*), a mountain of Catalonia, in the n.e. of Spain, about 23 m. n.w. of Barcelona. Its height is 3,919 feet. "Its outline," says Ford (*Handbook for Spain*, vol. i. p. 419), "is most fantastic, consisting of cones, pyramids, buttresses, nine-pins, sugar-loaves, which are here jumbled by nature in a sportive mood." The pious Catalonians aver that it was thus riven and shattered at the crucifixion. Every rift and gorge is filled with box-trees, ivy, and other evergreens. From the topmost height the eye wanders over all Catalonia, and from the sea the ridge looks like an immense wall with seven pyramidal peaks. The mountain, however, owes its celebrity not to its extraordinary appearance, but to the Benedictine abbey built upon it, at an elevation of 1200 feet, and to the 13 hermitages formerly perched like eagles' nests on almost inaccessible pinnacles. In 1811 the French, under Suchet, plundered the abbey, burned the library, shot the hermits, and hung the monks (who had given shelter to their emigrant brethren at the revolution). The place suffered still more in 1827, when it became the stronghold of the Carlist insurrection.

MONTT, Jorge, b. in Chile in 1847. In 1891 he took a prominent part in the revolution against Balmaceda, and was elected president of the republic of Chile for five years.

MONTT, Manuel (1809–1880), Chilean statesman. He took a prominent part in Chilean politics from 1841 to 1851, when he was elected president; was re-elected in 1856. His second term was notable for the revolutions which were aroused by his conservative policy.

MONTYON, Antoine Jean Baptiste Robert Auget, Baron de (sometimes erroneously named Monthyon), 1783–1820; b. in Paris. Left in the possession of considerable wealth while young, he soon became distinguished by his noble use of it. An advocate at 23, member of the council of state at 27, at the head of the government of Auvergne at 33, Montyon in every place exhibited benevolence and philanthropy in connection with administrative ability. He dedicated 20,000 livres annually to the help of poor workmen. After serving successively as intendant of Provence and La Rochelle he was called to Paris to be made councilor of state in 1775. He sent to the Académie Française in 1777 an *Éloge de Michel de l'Hospital*; in 1778 published *Recherches et Considérations sur la Population de la France*. In 1780 he founded a large number of prizes in the various societies of France, to be awarded through their officers to meritorious improvements or work in the arts, for the most useful literary works, for the best means of avoiding the unhealthy effects of certain mechanical operations upon the workmen, for the best treatises on mechanical processes, for the noblest acts performed by the poor, and for the most useful medicine. For each of these prizes or sets of prizes he set apart 12,000 livres of which the income should form the annual awards. At the beginning of the revolution, fearing the storm that menaced the rich and noble, he emigrated to Geneva, whence he sent an essay to the French Academy, entitled, *Consequences qui ont Résulté pour l'Europe de la Découverte de l'Amerique*, for which he received the prize of 3,000 francs, and presented it to the academy to be used for another prize. He took no part while in Geneva, or afterwards while residing in England, with the intrigues of the royalists. In 1798 he published in London a valuable work entitled *Rapport sur les Principes de la Monarchie Française*, intended as a refutation of a work by Calonne in which that minister asserted that France never had had a legal constitution. Montyon made a masterly showing that while France had not lacked for legal constitutions her kings had always power and will to violate them at pleasure. He remained an exile from his country throughout the directory and the empire of Napoleon I., not so much by his attachment to the old monarchy

as his repugnance to the military horrors of imperialism. He returned to Paris in 1814, and after 1815 re-established such of his prizes and beneficences as had been stopped by the revolution and the empire, and not only put them on a new footing but richly endowed new charitable institutions in Paris; and on his death in Paris distributed permanent bequests to a large number of the most beneficent institutions of France. Among his published works of permanent value are: *Quelle Influence ont les diverse Espèces d'Impôts sur la Moralité, l'Activité, et l'Industrie des Peuple;* and, *Particularités et Observations sur les Ministres de Finances les plus Célèbres depuis* 1660 *jusqu' en* 1791, a remarkably interesting compendium of facts, philosophy, and anecdotes.

MONUMENT (Lat. *monumentum*, from *moneo*, to remind), anything durable made or erected to perpetuate the memory of persons or events. The chief kinds of monuments are described under their special names. See ARCH, TRIUMPHAL; BARROWS; BRASSES; CAIRN; CROMLECH; MAUSOLEUM; OBELISK; PILLAR; PYRAMID; SEPULCHRAL MOUND; TOMB, etc.

MONUMENTAL THEOLOGY designates the scientific study of theological opinion and feeling as unconsciously expressed in works of art. While, in written language, thought is presented by the discursive faculty in elements which are gradually apprehended, a work of art, as a completed object existing in space, may produce at once its grand impression on the mind. But as the Christian church took its rise in the midst of Judaism and of heathen worship, and as its first members had been trained under the influence of one or both of these conflicting systems, Christian monuments as well as early church doctrine and practice often present a mixed character. In the progress of the church it was also frequently attacked by errors within and hostile influences without, the effect of which would be exhibited in its works of art. A complete consideration of monumental theology, would, therefore, require careful attention to these modifying agencies as they show themselves in works of art. The principles of Christianity, from its origin to the present day, have influenced human art as well as thought and life. While this influence has sometimes been disastrously exerted, it has generally been in some degree beneficial. After the revival of classical learning and the infusion of new elements into modern life, art was indeed partly liberated from that subjection to the church which in the middle ages had been complete. Yet it must always find its noblest inspiration in Christian themes. Consequently its monuments may be expected to exhibit much of the Christian thought and feeling of each successive age. Hence recent writers on theological encyclopædia continue the study of Christian monuments to the present time. Piper, the chief advocate of this method of collateral theological study, presents the following classification of its themes: I. Of the essential nature of Christian art—1. Of the art faculty. 2. The artist. 3. Works of art. II. History of Christian art and art-works—1. Chronology and geography of art. 2. The various species of art. 3. Art monuments. III. Christian art ideas—1. In architecture. 2. In the graphic arts. For theological purposes this last is the principal division, and to illustrate it the others are chiefly preliminary. Architecture furnishes to this department much less than painting and sculpture. Biblical subjects are found represented in works of art through all periods of church history. The *Biblia Pauperum*, Bible of the poor, for example, consisted of 40 or 50 pictures giving the events of the life of Christ and some of the Old Testament times; each picture had a Latin text or sentence. A larger work with the text in rhyme was called the *Mirror of Salvation*. Before the reformation these were the chief text-books in use, especially by the monks in their preaching, and were practically all the Bible which the laity and even many of the clergy knew. The pictures were copied in sculptures, in paintings on walls and on glass, and in altar-pieces. And after the invention of printing the *Biblia Pauperum* was perhaps the first book printed in Germany and Holland, first with wooden blocks and then with types. While monumental theology is an interesting and to some extent useful collateral study, its claim to an independent scientific treatment is denied by many eminent authors, and must be regarded, at best, undetermined.

MONZA (anc. *Modœtia*), chief t. of a district in the province of Milan, stands on the river Lambro, 10 m. n.n.e. of Milan, with which it is connected by railway. Pop. about 17,000. It is essentially a town of Lombard growth, and under the Lombard sovereigns was capital of their kingdom. It owes much of its early importance, and its chief public edifices, to Theodolinda, the great queen of the Lombard dynasty. In the middle ages, Monza was conspicuous for the wealth of its numerous citizens and nobles, and the extent of its cloth-trade. It has undergone 32 sieges. The cathedral, founded in the 6th c. by Theodolinda, contains many interesting memorials of this great queen. The famous iron crown (q. v.) and regalia of Lombardy, employed at the coronation of the German emperors as kings of Italy, were removed from Lombardy by the Austrians, in 1859, on the cession of that province to France. The town has a good gymnasium, a theater, two hospitals, and a philharmonic institution. Its present manufactures of cottons, hats, and preserved meats are daily increasing. Monza is surrounded by a fertile district, which yields abundance of grain, fruits, wine, and silk, and possesses great beauty of scenery and climate.

MOODY, a co. in e. S. Dakota, bounded by Missouri, drained by the Big Sioux river and its branches; about 500 sq. m.; pop. '90, 5941. Co. seat, Flandreau.

MOODY, DWIGHT LYMAN, evangelist, was born at Northfield, Mass., in 1837, and was the son of a farmer and stone-mason. At the age of seventeen, his father having died

some years before, he went to Boston to enter as clerk the shoe store of an uncle. Here he joined the Mt. Vernon Congregational Church. In 1865 he removed to Chicago to become a salesman in the shoe trade, became active in mission work, and established a very successful Sunday-School; during the civil war was employed by the Christian Commission and subsequently as city missionary by the Young Men's Christian Association. A church was built for him, and though unordained, he became its pastor. The building was destroyed by the fire of 1871, but a new one was erected to hold 2500 persons.

In 1873, by invitation, he visited Great Britain and Ireland with Ira D. Sankey the singer; in 1875 held a long series of meetings in Brooklyn and Philadelphia and in 1876 in New York. Similar services followed in many large cities throughout the country. In 1882 a second visit to England was made, and Mr. Moody was cordially received by the English clergy. Most of his work was done in the provinces, but he held large meetings also at the universities of Oxford and Cambridge with the co-operation of many officials and dignitaries of the Church of England. At Cambridge he at first met with much opposition, but fully overcame it. The results were remarkable: many students were seriously impressed, and a number of them, including some of the highest standing, devoted themselves to evangelistic and missionary work. He also held meetings at Paris. His later years were applied to the establishment and building up of a seminary for young women and a training-school of Christian workers, both at Northfield, Mass., and the Mount Hermon school for boys at Gill, near Northfield. He also engaged in evangelistic work as his other duties permitted. His publications include *Arrows and Anecdotes; Heaven; Secret Power; The Way to God; Bible Characters;* volumes of sermons, etc.

MOODY, James, 1744–1809; b. N. J.; a farmer who commanded a force of tories during the revolutionary war. He was taken prisoner, but escaped from West Point, where he was confined, and went to England. There, in 1783, he published an account of his loyalist campaigns, under the title of *Lieut. James Moody's Narrative of his Exertions and Sufferings in the Cause of Government since* 1776. After the war he removed to Nova Scotia. His *Narrative* was reprinted at New York in 1865.

MOODY, Joshua, 1633–97; b. England; in childhood came to Newbury, Mass.; graduated at Harvard college in 1653; began to preach in 1658; became pastor of the church in Portsmouth, N. H., in 1671. He became involved in quarrels with the government of the colony, and was imprisoned, but released on condition of his leaving the colony. In 1684 he was settled in Boston as the assistant minister of the First church; was appointed president of Harvard college, but declined the appointment. During the witchcraft trials in 1692 he opposed the unjust and violent measures against the accused, and aided some to escape from prison. His zeal occasioned his dismissal from the church, and he left the ministry. He published *A Practical Discourse Concerning the Choice Benefit of Communion with God in his House, witnessed unto by the Experience of Saints as the best Improvement of Time, being the sum of Several Sermons on Psalm lxxxiv.* 10, *preached at Boston on Lecture Days; A Sermon on the Sin of Formality in God's Worship, preached on the Weekly Lecture in Boston.*

MOODY, Samuel, 1676–1747; b. Mass.; graduated at Harvard college in 1697, was minister at York, Me.; was chaplain to sir William Pepperell's expedition against cape Breton. He was an eccentric but very useful man; some of his odd expressions are still in circulation, showing much shrewdness and a quick wit. He refused a regular salary, depending on the voluntary contributions of the people. He published *The Doleful State of the Damned; Judas hung up in Chains; Election Sermon; Life and Death of Joseph Quasson, an Indian.*

MOOLTAN. See Multân.

MOON, The, the satellite of the earth, revolving round the earth from w. to e. in a period of one *month* (q.v.), and in consequence accompanying the earth in its motion round the sun. As the moon, to an observer on the earth, advances more than 13° to the e. daily, whilst the corresponding advance of the sun is barely 1°, her progress among the stars is much more notable than that of the latter. This rapid angular motion, the continual and regular variation of her illuminated surface, and her large apparent size (being nearly equal to that of the sun), have rendered the moon an object of general interest; while her importance as the principal nocturnal substitute for the sun, and her special value to navigators and geographers, in the determination of longitudes (see Latitude and Longitude), have rendered the *lunar theory* the object of the most thorough and careful investigation.

Phases of the Moon —The first peculiarity about the moon that strikes a casual observer is the constant and regular change of her illuminated surface from a thin crescent to a circle, and *vice versâ*, and a corresponding change in the time of her appearance above the horizon. These changes depend upon the position of the moon relative to the earth and the sun, for it is only the half of the moon facing the sun that is illuminated by his rays, and the whole of this illuminated portion can only be seen from the earth when the sun, earth, and moon are in a straight line (the *line of syzygies*), and the earth is between the sun and moon. When the moon is in the line of syzygies, but

between the earth and the sun, no part of her illuminated disk can be seen from the earth. In the former case, the moon is said to be *full*, and in the latter, *new*. A few hours after "new moon," the moon appears a little to the *east* of the sun as a thin crescent, with the horns pointing toward the *east*, and as she increases her angular distance from the sun at the rate of about 12° daily, the crescent of light becomes broader, till, after the lapse of a little more than seven days, at which time she is 90° in advance of the sun, she presents the appearance of a semicircle of light. The moon is then said to have completed her *first quarter*. Continuing her course, she becomes "gibbous" (q.v.); and at the 15th or 16th day from new moon, attains a position 180° in advance of the sun, and now presents the appearance known as *full moon*. From this point she begins to approach the sun, again appearing gibbous, and after a third period of more than seven days, reaches a point 90° w. of him, and enters her *last quarter*. Here, again, she appears as a semicircle of light, the illuminated portion being that which was not illuminated at the end of the first quarter. The moon now rapidly approaching the sun, resumes the crescent form, but this time with the horns pointing *westward*, the crescent becoming thinner and thinner, till the moon reaches the position of new moon, and disappears. From "full moon" to "new moon," the moon is said to be *waning;* and from "new moon" to "full moon," *waxing*. The earth as seen from the moon presents similar phases, and has, consequently, at the time of new moon, the appearance of a round illuminated disk, and at full moon is invisible. This explains the peculiar phenomenon occasionally observed when the moon is near the sun (either before or after new moon), of the part of the moon's face which is unilluminated by the sun appearing faintly visible, owing to the reflection upon it of strong earth-light. This phenomenon is designated by the Scottish peasantry as "the new mune wi' the auld mune in her airms." At new moon, the moon of course comes above the horizon about the same time as the sun, and sets with him, but rises each day about 50 minutes later than on the day previous, and at the end of the first quarter, rises at midday, and sets at midnight, continuing to lag behind the sun. When at the full, she rises about sunset, and sets about sunrise, and at the commencement of her last quarter, she rises at midnight, and sets at midday.

Distance and Magnitude.—From repeated observations of the moon's horizontal *parallax* (q.v.), and of the occultations by her of the fixed stars, her mean distance* from the earth has been estimated at 237,600 m., and as her angular diameter averages 31′ 26″, her actual diameter is 2,153 m., or a little less than $\frac{3}{11}$ths of the earth's diameter. Her volume is therefore about $\frac{1}{49}$th of that of the earth, and her density being only .577 (that of the earth being taken as unity), her mass is only $\frac{1}{85}$th of the earth's mass; consequently, the force of gravity at her surface is so much less than it is at the surface of the earth, that a body which weighs 1000 lbs. here, would at the moon weigh only 163 lbs.

Orbit.—The moon revolves round the earth in an elliptic orbit, with the earth in the focus; the eccentricity of the ellipse being equal to .05491 of half its major axis, or more than $3\frac{1}{4}$ times that of the earth's orbit. The plane of her orbit does not coincide with the ecliptic, but is inclined to it at an angle of 5° 8′ 47.9″, and intersects it in two opposite points, which are called the *nodes* (q.v.). The point at which the moon is nearest to the earth is called her *perigee*, and that at which she is furthest from it her *apogee*, and the line joining these two points is called the *line of apsides*. Were the moon's orbit a true ellipse, which, owing to various irregularities known as *perturbations*, it is not, the *lunar theory* would be exceedingly simple; but these perturbations, which, in the case of the planets, produce a sensible variation in their orbit only after many revolutions, cause, in the case of the moon, a distinct and well-marked deviation from her previous course in a single revolution. The retrogradation of her nodes along the ecliptic causes a continual change in the plane of her orbit, so that if, during one revolution round the earth, she occults certain stars, at the next revolution she will pass to one side of them, and will remove further and further from them in each successive revolution. A little consideration will show that by this continual change of her orbit, the moon will, in course of time, pass over or occult every star situated within 5° 24′ 30″ of the ecliptic. The motion of the nodes is so rapid that they perform a complete circuit of the orbit in 6793.39 mean solar days, or 18.6 years. Another important change in the moon's orbit is the revolution of the line of apsides, by which the perigee and apogee are continually changing their position relative to the earth and sun. This revolution is more than twice as rapid as that of the nodes, being performed in 3232.57 mean solar days, or 8.85 solar years. As this motion is common to all the heavenly bodies, its nature and origin will be treated of under the head of perturbations (q.v.). Its effect upon the moon is to produce a variation in her distance from the earth, independent of that produced by her elliptic motion.

Eclipses.—As the moon in her course passes the sun at the commencement of every (synodic) month, and by the middle of the month has placed the earth between herself and the sun, it is evident that if she moved in the plane of the ecliptic, there would be either a *total* or an *annular eclipse of the sun* at the commencement, and a *total eclipse of the moon* in the middle of every month. The inclination of her orbit allowing her to pass the

* When the moon is at the *perigee*, she is within 225,000 m., and when at the *apogee*, more than 251,000 m. from the earth; her angular diameter as measured from the earth consequently varies from 28′ 45″ to 33′ 30″ and for a particular day is greatest when she is on the meridian, as in this case she is nearer to the spectator, by about 4,000 m., than when she is on the horizon.

sun 5° 9′ to the n. or s. of his track, prevents such a frequent occurrence of eclipses. If the moon, when in conjunction, is at either of her nodal points, and at the same time near her perigee, a total eclipse of the sun takes place; but if near her apogee, the eclipse is only annular, for at that time her apparent diameter is less than the sun's. If also, at her conjunction, her latitude n. or s. is less than the sum of her semi-diameter and of that of the sun, a *partial* eclipse takes place, and is greater the nearer the moon is to her node. These partial eclipses are seldom seen from all parts of the earth's illuminated surface, but are confined to a portion of it, which is greater or less according to the extent of the eclipse. Lunar eclipses, which occur when the moon is in opposition (i.e., at full moon), are seen equally from all parts of the earth's surface which are turned towards her. The conical shadow of the earth which is projected into space on the side opposite to the sun, is in length equal to about $3\frac{3}{5}$ times the moon's mean distance, and a section of it at the moon's distance is 1° 23′ in diameter. If, then, the moon, which is never more than $33\frac{1}{2}'$ in diameter, happens to be at or near her node, a *total* eclipse will take place, and in no case can it be *annular*, as is sometimes the case with those of the sun. Even during total eclipses, the moon is seldom quite invisible, but generally shines with a faint copper-colored light. See Eclipses.

Rotation.—The moon, like all other satellites, as far as at present known, revolves round her own axis in precisely the same time that she revolves round the earth; she thus presents always the same face to us, and consequently, though her comparative proximity has enabled us to become better acquainted with her surface than with that of any other heavenly body, our knowledge is confined to one half of her surface, with the slight exception of the knowledge obtained from her *libration* (q.v.). To the inhabitants of the side of the moon next the earth—if the moon had inhabitants, which is very improbable—the latter would appear as a luminary about 2° in diameter, immovably fixed in their sky, or at least changing its position only to the extent due to the moon's libration. The earth would thus seem to them to have a disk about 15 times larger than that of the sun.

Physical Features.—The surface of the moon, as seen from the earth, presents a most irregular grouping of light and shade. The dark portions were named by the earlier astronomers as seas, lakes, etc., and still retain these names, although there is strong evidence against the supposition that the moon, or at least that portion of it presented to us, contains any water. The brighter parts of the moon are mountainous, as is proved by the fact of their casting shadows when the sun's rays fall upon them obliquely, and also by the ragged appearance presented by the interior illuminated border of the moon, an appearance which can only be satisfactorily accounted for on the supposition that the surface of the moon is not level, in which case the higher portions will be illuminated some time before the light reaches the level parts; and it is observed that as the illumination proceeds, bright spots start up in advance of it, and when the moon is on the wane, these same spots continue to shine for some time after the surrounding surface is immersed in gloom. The mountains occur either singly, when they are generally of a circular form, and are called *craters*, or in groups, which are mostly annular, and form a sort of wall inclosing a deep depression or plain, in which are situated one or more conical mountains. The craters are not unfrequently 8 or 10 m. in diameter, and some of the walled plains measure more than 100 m. across. The principal mountain range is the Apennines, which crosses the surface from n.e. to s.w., and attains, according to some authorities, an altitude of about 20,000 ft., though sir John Herschel gives about 2 m. as the probable limit of elevation above the moon's surface. The heights are estimated from a micrometric measurement of the length of their shadows, a method not, in this case, susceptible of much accuracy. The moon everywhere presents traces of volcanic agency, but no active volcanoes have yet been discovered, nor is there any sign of recent volcanic action. Seen through the telescope, she presents a bleak, desolate appearance, without indications of animal or vegetable existence. She appears to be devoid of an atmosphere, or, if one exists, it must be of exceeding rarity.

The influence of the moon in causing *tides* (q.v.) has long been well known, and there is some reason for supposing that she produces a similar effect on the atmosphere, combining with other causes in the generation of winds. Those winds which prevail about the time of new and full moon, and at the vernal and autumnal equinoxes, are particularly ascribed to her influence. On the supposition that the moon might also affect organic nature, experiments were instituted by Mead, Hoffmann, and others; but no certain results were attained. The periodicity which has often been noticed in certain diseases, especially in insanity (hence called *lunacy*), was long supposed to have some connection with lunar influence, and this opinion is held to some extent at the present day. The chemical effects of the moon's rays are, so far as is at present known, feeble, though in particular instances they exhibit an *actinism* as powerful as that of the sun. Decomposition of animal matter takes place more rapidly in moonshine than in darkness, and the concentrated rays have a sensible effect on the thermometer.

The best map of the moon is the large and accurate one of MM. Baer and Mädler, which presents a most minutely detailed picture of her visible surface; the map is 3 ft. in diameter. See for further information the articles Perturbations; Libration; Nodes; Evection; Metonic Cycle; Tables, Lunar, etc. See illus., Solar System, vol. XIV.

Superstitions regarding the Moon.—The moon was anciently an object of worship, and even in the 17th c. she was supposed, by the common people of England, to exercise great influence over human affairs. The times for killing animals for food, gathering herbs, cutting down wood for fuel, sowing seeds of various kinds, were all regulated by the "age" of the moon, and these set periods were considered to be a necessary part of practical knowledge, and ignorance or neglect of them to be infallibly productive of loss. There were similarly defined periods for taking particular medicines, and attempting the cure of particular diseases. Many such superstitions prevailed until a recent period in the Highlands of Scotland, favorable or unfavorable consequences from any occurrence being predicted according to the age of the moon at the time it happened. Throughout Scotland, the waning moon was considered to have an evil influence, and full or new moon to be the most auspicious season for commencing any enterprise. The same opinion was held in Scandinavia and Germany, and the history of all nations teems with similar superstitions. See the articles ECLIPSES, SUPERSTITION.

In the Edda, we read that "Mundilföri had two children—a son, Mâni (moon), and a daughter, Sôl (sun);" and in German, the moon is masculine and the sun feminine to this day. It was the same in Ang.-Sax.; although modern English has in this matter followed the classic mythology, in which Phœbus and Sol are gods; and Selene, Luna, and Diana are goddesses; Grimm (*Deutsche Mythologie*, p. 666) quotes an old invocation to the "New Moon, gracious lord" (Neuer Mon, holder herr), for increase of wealth; and down to recent times the German people were fond of speaking of "frau sonne," and "herr mond" ("lady sun," and "lord moon"). The same inversion (as it appears to us) of gender is found among the Lithuanians and Arabians, and even the ancient Mexican meztle (moon) was masculine. Among the Slaves, according to Grimm, the moon is mas., a star fem., and the sun neut. In Hindu mythology also, the moon—Chandra or Soma—is a male deity, represented by one myth as the son of the patriarch Atri, who procreated him from his eyes, but by another as arising from the milk-sea when it was churned by the gods for the attainment of the beverage of immortality. His wives are the 27 daughters of the patriarch Daksha, known as the nymphs of the lunar constellations. By one of them, Rohini, he had a son Budha (not to be confounded with Buddha), the regent of the planet Mercury, who begot on Ilâ, a son, Purûravas, who became the ancestor of a royal family, hence called the lunar dynasty.—The moon is generally represented as wearing white garments, with a mace in one hand, and riding in a chariot drawn by ten horses or antelopes. The animal sacred to him is the hare (the Hindus believing that an outline like that of a hare is visible on the moon); and the plants under his special patronage are a certain variety of the lotus, which flowers when the moon rises, and the soma plant, or *asclepias acida*. As the receptacle of the beverage of immortality, he is thus described in the Vishnu-Purâna: "The radiant sun supplies the moon, when reduced by the draughts of the gods to a single digit, with a single ray; and in the same proportion as the ruler of the night is exhausted by the celestials, it is replenished by the sun . . . . ; for the gods drink the nectar accumulated in the moon during half the month; and from this being their food, they are immortal: 33,000, 3,300, and 33 divinities drink the lunar nectar. When two digits remain, the moon enters the orbit of the sun, and abides in the ray called Amâ. . . . . In that orbit, the moon is immersed for a day and night in the water, thence it enters the branches and shoots of the trees, and thence goes to the sun. . . . . When the remaining portion of the moon consists of but a 15th part, the manes approach it in the afternoon, and drink the last portion, that sacred digit which is composed of nectar. . . . . In this manner the moon, with its cooling rays, nourishes the gods in the light fortnight (or the 15 days of the moon's increase), the manes in the dark fortnight (when in the wane); vegetables, with the cool nectary aqueous atoms it sheds upon them; and through their development it sustains men, animals, and insects, at the same time gratifying them by its radiance."

MOONJAH, MUNJAH, or MOONYAH (*saccharum munja*), a grass of the same genus with the sugar-cane, a native of India, the leaves of which afford a useful fiber, of which ropes are made. The moonjah grows in vast abundance in the neighborhood of the Ganges, Indus, and other rivers. The fiber of the moonjah is very tough and strong. No proper trial seems yet to have been made of the qualities of the moonjah fiber, more carefully prepared; but considering the facility with which it could be obtained in any desirable quantity, it seems to deserve attention.—Very similar to the moonjah is the SARA or SHUR of Bengal (*saccharum sara*), another species of the same genus, the leaves of which are employed in the same way.

MOON, MOUNTAINS OF THE. The "Mountains of the Moon" have ever played an important part in the history of African geography, and have given rise to many curious hypotheses. Ptolemy, and until lately many of the ablest geographers, supposed that a very high chain of mountains crossed the continent of Africa from e. to w.; and they have continued to shift these mountains from one latitude to another, ranging from 10° n. to 10° s., but still keeping them within nearly the same meridional bounds. Dr. Beke, from his own researches and a minute study of the geography of eastern Africa, propounded the theory, that the so-called Mountains of the Moon run from n. to s. parallel to the coast of Zanzibar, instead of from e. to w.; forming, in fact, a continuation of

the great Abyssinian table-land, and embracing the snow-capped mountains of Kenia and Kilimandjaro, which have an altitude of 20,000 feet.

The mass of mountains discovered by capt. Speke in 1858, round the head of lake Tanganyika, is considered by him, both from its crescent form and its position, to be part of the Mountains of the Moon of Ptolemy; but mountains of this height (6,000 to 10,000 ft.) could never be snow-clad so near the parallel of the equator.

MOONSEED, or yellow parilla, *menispermum canadense;* nat. order *menispermaceæ* (q.v.). The Canadian moonseed is a North American climbing plant having peltate, roundish-cordate, and angular leaves, small clusters of greenish-yellow flowers, and black, glaucous, roundish, kidney shaped drupes (stone fruit). The root was formerly known in commerce as Texas sarsaparilla; its botany was established by R. P. Thomas in 1855. The root is several feet long, about a quarter of an inch thick, cylindrical when dry, with longitudinal wrinkles, and thin, branching rootlets. It contains a small quantity of berberine, and a larger quantity of a white alkaloid soluble in ether, alcohol, and much water. It also contains starch, and other constituents which have not been examined. It is regarded as a tonic, alterative, and diuretic.

MOONSTONE. See FELDSPAR.

MOONWORT. See BOTRYCHIUM.

MOORCROFT, WILLIAM, about 1780–1825; b. England; one of the earliest of veterinary surgeons, and also one of the earliest explorers of the Himalayas, and the lakes, rivers, and valleys of Chinese Tartary. An account of his travels was published in London in 1841, edited by Prof. H. H. Wilson, entitled *Travels in the Himalayan Provinces of Hindustan and the Punjab, in Ladakh and Kashmir.*

MOORE, a co. in central North Carolina, drained by Cape Fear, Deep and Little rivers, and many creeks; and traversed by the Raleigh and Augusta railroad; 924 sq. m.; pop. '90, 20,479. The surface is hilly and broken, covered in great part by forests. Cotton, Indian corn, wheat, and pork are the staples; coal has been found. Co. seat, Carthage.

MOORE, a co. in s. central Tennessee, organized in 1872; drained by the Elk river and its creeks, and traversed by the Louisville and Nashville railroad; 170 sq. m.; pop. '90, 5975, includ. colored. The surface is broken and hilly. Co. seat, Lynchburg.

MOORE, a co. in n. w. Texas; drained by the Canadian river; formed 1876; organized 1892; 900 sq. m.; pop. '90, 15. Co. seat, Dumas.

MOORE, ALFRED, 1755–1810; b. N. C.; became capt. in 1775 in a North Carolina regiment whose col. was his uncle, Col. James Moore. He afterwards threw up his commission, but, after the capture of Wilmington by the British, he enlisted a volunteer force, which did good service during the remainder of the war. In 1790, when his knowledge of the law was still extremely scanty, he was elected by the state legislature attorney-general, and he soon acquired sufficient legal learning to discharge with credit the duties of that office. In 1798 he took a seat on the bench of the state court, from which he was promoted the next year to the supreme court of the United States, where he remained till 1805.

MOORE, BENJAMIN, D.D., 1748–1816; b. Long Island; graduated at King's, now Columbia college, in 1768; admitted to the ministry as deacon and priest in England, in 1774, by the bishop of London; returned to America and was assistant minister of Trinity church, New York, 1774–1800; became rector in 1800. In 1801 he was consecrated bishop of the Protestant Episcopal church of New York, and also appointed professor of logic and rhetoric in Columbia college. He was president of the college, 1800–11, continuing also to perform the duties of the ministry. Dr. Hobart, who succeeded him, was his assistant after he became disabled from paralysis. He was an accomplished scholar and an able preacher. He published two sermons in the *American Preacher;* also, a *Sermon before the General Convention; A Pamphlet in Vindication of Episcopal Services.* His *Posthumous Sermons* were published by his son, Clement C. Moore.

MOORE, CLEMENT CLARK, LL.D., 1779–1863; b. in New York; son of Bishop Moore of R. I.; educated at Columbia college, graduated in 1798, and, having made a specialty of the study of Hebrew, was appointed professor of biblical learning in the Protestant Episcopal theological seminary of New York (1821), having already, in 1809, published a Hebrew and English lexicon. In this institution he remained, some changes being made in the title of his professorship, until 1850, when he retired with the title of professor emeritus. The plot on which the seminary stands was the gift of Dr. Moore. He was a poet of merit; published a collection of poems in 1844, and in 1850 *George Castriot.* By far the best known of his poetical writings is the ballad beginning "'Twas the night before Christmas; and all through the house," etc.

MOORE, EDWARD, 1712–57, English dramatist, son of a dissenting clergyman, and in his early life a linendraper. Failing in business he devoted himself to literary pursuits, his first venture being *Fables for the Female Sex,* in 1744. He afterwards wrote two comedies, *The Foundling* and *Gil Blas,* which were produced but were unsuccessful. His next

work was the successful tragedy *The Gamester*, which was produced at the Drury Lane theater in 1753. Garrick appeared in it, and it has been many times reprinted. Moore became editor of the *World* in 1753, and in his work on this popular sheet was aided by some of the most talented literary men of the time, among them Horace Walpole, Lord Chesterfield and Lord Lyttelton. His *Poems, Fables and Plays* were collected and published in 1756. An edition of his dramatic works was published in 1788.

MOORE, Frank, b. N. H., 1828; brother of George Henry. Became a journalist and general writer, in early life; in 1869 was appointed secretary of legation at Paris, and resided there, in the performance of his official duties, during the period of the Franco-German war and the commune. He edited and prepared the *Rebellion Record*, a voluminous and valuable chronicle of the American rebellion of 1860–65, published in 12 vols., 1861–71. He published *Diary of the American Revolution*, 2 vols.; *Songs and Ballads of the American Revolution; Lyrics of Loyalty* (songs of the war against rebellion); and *Rebel Rhymes and Rhapsodies*—a similar collection made from among the writers of the confederate side.

MOORE, George, is a novelist of the realistic school. He was born in Ireland about 1853, but was educated in France. He has written many articles for the magazines: an essay on Balzac, which appeared originally in the *Fortnightly*, being one of the most noteworthy. Under the title *Notes and Sensations* he has contributed from time to time to the London "Hawk." His published books include *A Mummer's Wife, A Drama in Muslin, A Mere Accident, Confessions of a Young Man, Mike Fletcher, Spring Days* and *Impressions and Opinions* (1891); *Esther Waters* (1894); *Celibates* (1895), etc. He has also written several plays. Moore is weakest in dialogue and in his dramatic productions. He is a pessimist—a disciple of Schopenhauer—and an egotist. In his extremely frank realism he is an English Zola. His critical work is of more permanent value than his novels, the latter being too erratic and erotic for lasting distinction.

MOORE, George Henry, ll.d., b. N. H., 1823; went to New York at the age of 16 years, and assisted his father, then librarian of the N. Y. historical society, whom he succeeded in that position in 1849. He remained in this office until the foundation of the Lenox library, when he was named by the late James Lenox, esq., founder of the library, to be its first superintendent, which position he held till his death. He received his degree of ll.d. from the university of New York. He was a learned bibliographer and a skilled administrator, and to his capacity the N. Y. Historical Society owes in a great degree its progress from an insignificant beginning to a secure and eminent position among the leading literary institutions of the country. Mr. Moore was an able writer on certain special subjects concerning which he was a recognized authority. He published *The Treason of Charles Lee; Employment of Negroes in the Revolutionary Army; Notes on the History of Slavery in Massachusetts;* and *History of the Jurisprudence of New York.* He died May 5, 1892.

MOORE, Sir Henry, 1713–69; b. Jamaica; was made a baronet for suppressing a slave insurrection while governor of Jamaica; and next received the appointment of governor of New York, an office he retained from 1769 until his death.

MOORE, Henry, 1751–1843; b. in Dublin; became a Wesleyan Methodist, was admitted to probation in 1779, and for some years preached in Ireland, after which he was associated personally in John Wesley's work. As a revivalist and preacher he had great success, and was the last to die of those whom Wesley had ordained. He wrote the *Life of John and Charles Wesley and Memoirs of the Family* (1824); *Memoir of Mary Fletcher;* and an autobiography.

MOORE, Jacob Bailey, Jr., 1797–1853; b. N. H.; learned the printer's trade in Concord, where he worked in the office of the *Patriot*, a newspaper to which he contributed. He married into the family of the proprietor, and was taken into partnership by him but left the paper to found the *N. H. Statesman*, for the purpose of pressing the election of John Quincy Adams to the presidency. In 1828 he was made a member of the state legislature, and in the following year sheriff of Merrimack co., a position which he held for five years. He also edited the *N. H. Journal;* and in 1839 went to New York, where, for a brief period, he edited the *Daily Whig*. In 1841–45 he was employed in the post-office in Washington. In 1845 he was appointed librarian of the N. Y. historical society library, and in 1848 postmaster at San Francisco, Cal. He was one of the compilers of Farmer and Moore's *Historical Collections of New Hampshire*, one of the earliest publications in American local history. He also published a *History of Concord, N.H.; Laws of Trade in the United States; History of Andover; Gazetteer of New Hampshire;* and *Memoirs of American Governors.*

MOORE, Jesse Haile, b. Ill., 1817; educated at McKendree college, Lebanon, and in 1844 became principal of Georgetown seminary. He became pastor of the Methodist Episcopal church at Shelbyville in 1848, and was successively principal of Paris seminary and president of Quincy college. In 1862 he raised the 115th regiment of Illinois volunteers, and served through the war, retiring at its close with the brevet rank of brig. gen. He served in Congress, 1869–73.

MOORE, John, d.d.; b. at Castletown, Delvin co., Westmeath, Ireland, 1835; graduated at the Propaganda as D. D., 1860, and for 17 years held pastorates in South Carolina. He was appointed bp. of St. Augustine, Fla., 1877.

MOORE, JOHN, M.D., a Scottish physician and miscellaneous writer, son of the rev. Charles Moore, an Episcopalian clergyman, was born at Stirling in 1729. Educated at the university of Glasgow, he began the study of medicine and surgery under Dr. Gordon, surgeon, of that city, which study he followed up in Holland, London, and Paris, and then, as the partner of his old master, Dr. Gordon, began to practice in Glasgow. As medical attendant to the duke of Hamilton, he spent five years traveling on the continent, and on his return in 1778 settled in London. In 1779 he published *A View of Society and Manners in France, Switzerland, and Germany* (Lond. 2 vols. 8vo). In 1781 appeared *A View of Society and Manners in Italy* (2 vols. 8vo); in 1786 his *Medical Sketches*, in two parts; and in 1789 *Zeluco*, a novel (2 vols. 8vo)—the principal, or, at any rate, the most popular of his works. His other works are: *A Journal during a Residence in France*, 1792 (2 vols. Lond.), descriptive of scenes witnessed while at Paris in the autumn of that year as medical attendant of the earl of Lauderdale; *A View of the Causes and Progress of the French Revolution* (2 vols. Lond. 1795); *Edward*, a novel (Lond. 1796); and *Mordaunt*, a novel (Lond. 1800, 3 vols. 8vo). He also edited a collected edition of Smollett's works, with a life of the author. He died at Richmond in Surrey, Feb. 20, 1802.

MOORE, Sir JOHN, English gen., born at Glasgow, 1761, was eldest son of the preceding. He entered the army as ensign when only 15, and served with distinction in Corsica as col.; in the West Indies as brig.gen.; in Ireland during the rebellion of 1798, and in the expedition to Holland as gen. of staff. He was in Egypt with the army under Abercromby, and obtained the order of the bath for his services in command of the reserve. When war again broke out in 1802 Moore served in Sicily and Sweden. In 1808 he was sent with a corps of 10,000 men to strengthen the English army in the peninsula. He arrived in Mondego bay Aug. 19, and assumed the chief command on the return to England of sir H. Burrard. In October he received instructions to co-operate with the forces of Spain in the expulsion of the French from the peninsula. He moved his army from Lisbon, with the intention of advancing by Valladolid to unite himself with the Spanish Gen. Romana, and threaten the communications between Madrid and France. But the apathy of the Spaniards, and the successes of the French in various parts of the peninsula, soon placed him in a critical position. Yet he had determined to make a bold advance from Salamanca to attack Soult, when the news reached him that Madrid had fallen, and that Napoleon was marching to crush him at the head of 70,000 men. Moore's forces amounted to only 25,000 men, and he was consequently forced to retreat. In December he began a disastrous march from Astorga to Corunna, a route of nearly 250 miles, through a desolate and mountainous country, made almost impassable by snow and rain, and harassed by the enemy. The soldiers suffered intolerable hardships, and arrived at Corunna in a very distressed state. It was impossible to embark without fighting, and Soult was in readiness to attack as soon as the troops should begin to embark. The battle was mainly one of infantry, for the cavalry, after destroying their horses, had gone on board, and the bulk of the artillery, for which the ground was not adapted, had also been withdrawn. On Jan. 16, 1809, the French came on in four strong columns. A desperate battle ensued. While animating the 42d regiment in a brilliant charge in an early stage of the action Moore was struck by a cannon-ball on the left shoulder, and died in the moment of victory. The French were defeated with the loss of 2,000 men; and the funeral obsequies of the deceased soldier were performed with melancholy solemnity just before the embarkation of his troops.

MOORE, MARTIN, 1790–1866; b. Mass.; graduated at Brown university in 1820; was pastor of a Congregational church at Natick, Mass., for nearly 30 years, and afterwards at Cohasset. He edited the *Boston Recorder* for 20 years. He published *History of Natick; Life of John Eliot*. He was vice-president of the New England genealogical society in 1861–6.

MOORE, NATHANIEL F., LL.D., 1782–1872; b. New York; educated at Columbia college, and admitted to the bar. In 1817 he was appointed adjunct professor, and in 1820 full professor of Greek and Latin in Columbia college, where he remained till 1835, when he went abroad. On his return in 1837 he became librarian of the college, to whose presidency he was called in 1842. He held that office till 1849. He published *A Historical Sketch of Columbia College; Ancient Mineralogy; Lectures on the Greek Language and Literature;* and *Remarks on the Pronunciation of the Greek Language.*

MOORE, RICHARD CHANNING, D.D., 1762–1841; b. New York; educated at King's, now Columbia, college; became a physician; entered the ministry of the Protestant Episcopal church; was pastor at Rye, N.Y.; rector of St. Andrew's, Staten island, 1789–1809; rector of St. Stephen's, New York, 1809–14; consecrated bishop of Virginia in 1814 as successor of bishop Madison. He was a prominent leader in the evangelical branch of the Episcopal church. During the last twelve years of his life he had as an assistant Bishop Meade, who succeeded him as bishop of the diocese.

MOORE, THOMAS, the son of a small tradesman, who, through the influence of lord Moira, afterwards became a barrack-master in the army, was born in Dublin on May 28, 1779. At an early age he was placed at a school in which Sheridan had formerly been a pupil. In 1793 he was sent to the Dublin university, where he ultimately took the degree of B.A. Before entering the university he had written verses for a Dublin magazine; and while there he translated the *Odes* of Anacreon, in the hope of obtaining a classical premium, in which, however, he was disappointed. In Dublin he acquired

Italian and French, and being fond of music, he learned to play on the piano—an accomplishment which was of service to him in his future career.

In 1798, with his translation of Anacreon in his pocket, he came to London to study law, and entered himself in the Middle Temple. In 1800 he published his translations, dedicated to George IV., then Prince of Wales. In 1802 he produced his *Poetical Works of the Late Thomas Little*—a volume of sweet but licentious verse, which was a good deal blamed, and very widely read. In 1803, through the influence of lord Moira, he was appointed to a government post at Bermuda. He arrived there in Jan., 1804; but finding his situation disagreeable, he committed his duties into the hands of a deputy, and traveled in America previous to his return to England. His transatlantic experience seems to have cured him of the democratic ideas which he had imbibed in Dublin. On his return to England, he published *Odes and Epistles*, for which he was sharply taken to task in the *Edinburgh Review*. A duel between himself and Jeffrey was the consequence—over which Byron made so much mirth—and which resulted in the combatants becoming the most excellent friends. In 1807 he engaged with Mr. Power to produce the *Irish Melodies*, and on this work he was engaged at intervals up till 1834. In 1811 he married, and shortly after he went to reside in Derbyshire, where in 1813 he produced *The Twopenny Post-bag*, full of brilliant fancy—in which the tropes not only glittered but stung.

As up to this time he had produced nothing but fugitive pieces he became anxious to emulate his brethren, who wrote long poems, and published in quartos. He fixed on an oriental subject, and the Messrs. Longman agreed to purchase the poem for 3,000 guineas. In 1817 the long-expected *Lalla Rookh* appeared—brilliant as a fire-fly, and the whole English world applauded. After the publication he went to Paris, where he wrote *The Fudge Family*, which appeared in 1818. At this time he learned that his deputy in Bermuda had misconducted himself, and that he had become liable for a large sum, which was afterwards, however, considerably reduced. Lord Lansdowne paid the claim, and Moore repaid his lordship afterwards.

In 1819 Moore went to Paris with lord John Russell, and extended his tour to Italy, and saw lord Byron at Venice. He returned to Paris, where he brought his family, and fixed his residence till 1822. Here he wrote *The Loves of the Angels*, which appeared in 1823, and *The Epicurean*, a prose romance, which was not published till 1827. On his return to England he fixed his abode at Sloperton Cottage, near Bowood, and issued the *Memoirs of Captain Rock* in 1824, and the *Life of Sheridan* in 1825.

Byron had handed over to Moore, for his own especial benefit, a manuscript autobiography, on the condition that it should not see the light till after its author's death. Byron died in 1824, and as, at the request of his lordship's relatives, the manuscript was destroyed, Moore then entered into arrangements with Murray to produce a life of the deceased poet. The *Life of Lord Byron* was published in 1830, in two volumes. Next year he published the *Life of Lord Edward Fitzgerald*. His last important work was a *History of Ireland*, published in *Lardner's Cyclopædia*. A pension of £300 per annum was conferred on him in 1835. In 1841 he brought out an edition of his entire poetical works. For the three years preceding his death, he was afflicted with softening of the brain. He died Feb. 25, 1852. His friend, lord John Russell, published his *Memoirs, Journal, and Correspondence*, in 8 vols. (1852–56).

Despite his popularity during his lifetime, Moore can hardly be placed in the rank of great poets. His muse is a spangled dancing-girl—light, airy, graceful, but nothing more. His most ambitious work, *The Loves of the Angels*, is far beneath the Miltonic, or even the Byronic standard. *Lalla Rookh* is brilliant, but fatiguing. He is most successful in polished satire and the lighter sentiments; and his reputation will ultimately rest on *The Twopenny Post-bag* and the *Irish Melodies*.

MOORE, Zephaniah Swift, d.d., 1770–1823; b. Mass.; graduated at Dartmouth college in 1793; was pastor of the Congregational church at Leicester, Mass., in 1798; elected professor of languages in Dartmouth college in 1811; president of Williams college in 1815, and of Amherst in 1821. He was especially interested in natural science.

MOORFOWL, Red Grouse, or, in books of natural history, Red Ptarmigan or Brown Ptarmigan (*Lagopus Scoticus*), a bird peculiar to the British islands, and affording more amusement to sportsmen than any other kind of feathered game in Britain. It is the bird generally known in Britain by the name *grouse*, although not a true species of grouse, but rather of ptarmigan (q.v.). The toes are completely feathered, as well as the legs; the bill is very short, and its base much concealed by feathers. The length of the moorfowl is about 16 in., of which about 4 in. belong to the tail. The tail is nearly square. The wings are short. The plumage is of a deep chestnut-brown color, marked on the back and wing-coverts with black spots, and on the under parts with undulating black lines; the four middle tail-feathers are also marked with transverse black lines. Above the eyes is a naked space (the cere), of a bright scarlet color. The moorfowl is plentiful in the moors of Scotland and the Hebrides, Wales, the north of England, and Ireland. It feeds on the tender tops of heath, crowberries, bilberries, etc.; and not unfrequently visits the fields of oats and other grain in the vicinity of the moors, particularly when the *stooks* remain long in the field in late and rainy harvests. The moorfowl is not polygamous, and pairs in spring, when the plumage—particularly of the male—assumes a lighter and redder tint. The female lays from eight to fifteen eggs. The

nest is on the ground, often under shelter of a tuft of heath. The young run about very soon after they are hatched. "Grouse" remain in *coveys* (broods) from the time they are hatched till late in the autumn, after which they "pack" or assemble in large bodies. A cream-colored variety of moorfowl is sometimes found in the north of England. The moorfowl is easily domesticated, and breeds readily in an aviary, if supplied with heath for food.

MOORHEN. See GALLINULE.

MOORING (allied probably to Dutch *marren*, to delay, fasten; Eng. *marline*, for fastening the sail to the bolt-rope; Lat. *mora*, delay), a fastening to retain a ship in a given position. This may be either by her own anchors, or (which is the more common meaning of the term) by fixed and permanent buoy, which, on its part, is anchored to the bottom. A chain-mooring is where a strong chain is stretched for some distance on the bottom, being securely anchored or otherwise made fast at each end, and perhaps in intermediate places. Numerous buoys are then floated from it, and it becomes the mooring-ground for many vessels. Chain-moorings are frequent in all large harbors where comparatively small vessels require to ride.

MOORISH ARCHITECTURE. See ARABIAN ARCHITECTURE.

MOORS (Lat. *mauri*, meaning dark; Spanish, *moros*) are a people who form the great majority of the population of Barbary. Their appearance indicates their origin, which is a mixture of the Mauri (from whom they derive their name), Numidians, Phenicians, Romans, and Arabs, who have successively held possession of the country. In consequence, they are found to vary considerably in appearance and character in different parts of Barbary, but all show more or less strongly the symptoms of a considerable infusion of Arabian blood. They are a well-formed race, with fine oriental features, and a mild and melancholy expression of countenance. They are more friendly and sociable than the Bedouins and Berbers, who inhabit the deserts and mountains; but are inferior to them in mental ability, besides being voluptuous and cruel. They constitute, generally speaking, the tradesmen, artizans, merchants, and agriculturalists of Barbary; but a considerable number lead a pastoral life. The dress of the Moors consists of a piece of woolen cloth, five ells in length by one and a half in breadth, called a "haique," which is thrown over the shoulders, and fastened round the body; it also serves as a covering by night. This, when supplemented by a pair of slippers, a red cap, and a hood, constitutes the sole habiliment of the people generally. In the towns, the "caftan" is generally worn over the haique. The Moors employ the Arabic language, but with many corruptions and deviations from the original, and these appear to increase toward the west.

As the Arab conquerors of Spain invaded that country from Africa, where they had largely recruited their forces, they were naturally enough called Moors, and in Spanish history the terms Moors, Saracens, and Arabs are synonymous. From this mixed Moorish-Arab race sprung the *Moriscoes*, who were permitted by Ferdinand the Catholic to remain in Spain after the expulsion of their countrymen, on condition of their embracing Christianity. A cruel persecution, which was originated by Philip II., drove them to rebellion (1567–70), and in 1571 many emigrated to Africa; those who remained being, to the number of 500,000, expelled in 1610 by Philip III.

The Moors first appear in modern history as the allies of the Vandals in their invasion of Africa, and were continually rebelling against the Byzantine emperor. They were next, after a severe struggle, conquered and converted by the Arabs in 707. In 1091 they were summoned by the latter into Spain, to aid in stemming the tide of Christian conquest; and after faithfully supporting the Arab calif of Cordova, etc., till his dominions fell into the hands of the king of Leon and Castile, they retired in 1238 to Granada, where they founded their kingdom. The kings of Granada carried on a vigorous, and, at the same time, chivalrous warfare with the kings of Castile; but at length, weakened by internal discord, were compelled to succumb to Ferdinand the Catholic in 1492. The Moors, or at least that portion of them who refused to adopt Christianity, were then expelled from Spain, and, in revenge, founded in 1518 the piratical states of Algiers and Tunis. Their subsequent history cannot be separated from that of Algiers, Tunis, and Morocco.

MOORUK (*Casuarius Bennettii*), a recently discovered bird of the same genus with the Cassowary (q.v.), of which it was at first regarded as a mere variety, a native of the island of New Britain. It is about 5 ft. in full height, 3 ft. to the top of the back, is of a reddish color, mixed with black, and has a horny plate instead of a helmet-like protuberance on the top of the head. The claw of the inner toe of each foot is very long. It becomes extremely tame and familiar in captivity; may be fed on potatoes, maize, or any similar food; and is apt to prove troublesome by swallowing anything, however indigestible, that may come in its way.

MOOSE. See ELK.

MOOSEHEAD LAKE, the largest lake in Maine, from which the Kennebec river

takes its rise. It lies on the borders of Somerset and Piscataquis counties, about 75 m. n. by e. of Augusta; is 36 m. in length, from 3 to 10 in width; and is surrounded by a thickly wooded country that is sparsely inhabited. The forests abound in game, including the deer and caribou; and the lake, with the neighboring region, is much frequented by sportsmen. In the winter the lumbermen of the Kennebec cut much of their timber near its banks.

MOOSE RIVER in the district of Algoma, province of Ontario, Canada, rises in latitude 49°, flows northward, and receiving near its mouth the rivers Kapuskusa and Abbitibbe, empties into James Bay.

MOOSH, a t. of Asiatic Turkey, capital of a small pashalic of the same name; population estimated at 6,000. It is pleasantly situated on the sides and summit of a conical hill near the Murad Chaï, or eastern arm of the Euphrates, 75 m. s. e. of Erzeroum. The plain in which it stands is about 40 m. in length and 12 or 14 m. in breadth, and is well watered. The climate is variable. It contains 100 villages, and produces grain, tobacco, and wine of good quality. The town presents a poor appearance. It is inhabited by Turks and Armenians; the latter, having the trade of the place, are wealthy, and pay an annual tribute of $10,000, from which the Turks are exempt. There are 7 mosques.

MOQUE'GUA, a maritime department of Peru, extending from the Pacific Ocean to the maritime Cordilleras, bounded on the south by Chile; is almost desert and rainless, but is crossed by several fertile water courses. In the interior are excellent pastures. Silver and other metals are found, but have not yet been successfully mined. The department originally contained the provinces of Moquegua, Arica and Tacna, of which the principal towns bear the same names. The area of the department was about 30,200 sq. m. The port of Arica is at present in the hands of the Chilean government. A popular vote was to have decided in 1894 whether Tacna and Arica should belong to Chile or to Peru, but the decision was deferred. If taken from Peru, the area of the remainder would be about 10,400 sq. m. The chief city, Moquegua, is situated at the foot of the Cordilleras in the fertile valley of Ilo, at an altitude of nearly 4,500 feet above the sea. It is connected with the port of Ilo by a railroad 68 miles long. It has vineyards. It was founded in 1626, and has suffered from earthquakes, the one of Aug. 13, 1868, having destroyed the town. Pop. of department about 40,000, of town about 5,000.

MOQUIS, the name of a tribe of Indians living in n.w. Arizona, on the Little Colorado and San Juan rivers. They are known as far back as the middle of the 16th c., when they were visited by the Europeans, and received from them certain domestic animals, including sheep, the breed of which they continue to hold. Missionaries were sent among them by the Franciscans, but in the latter part of the 17th c. there was a general rising of the Moquis, when the missionaries were exterminated. An attempt in 1723, on the part of the viceroy of Mexico, to subdue this tribe, was unsuccessful; but 25 years later a new Franciscan mission had been effectual in making converts among them. Since that time they became peaceable, only resisting the attacks of the Apaches and Navajoes, who became their bitter foes, and have harassed them greatly. They are agricultural; are divided into 9 subdivisions, or families; and dwell in villages of houses built after the manner of the Indians of New Mexico. At the time when the United States government first took them in charge the Moquis were estimated to number 8,000; but in 1855 they were severely afflicted by an epidemic of small-pox, and their numbers much reduced; and, again, they suffered from famine in 1866. Their number in 1884 was reported at 1813. They are not intemperate, and their women are noted for chastity.

MORA, a genus of trees of the natural order *leguminosæ*, sub-order *cæsalpinieæ*, containing only one knows species, *M. excelsa*, discovered by sir R. Schomburgk, and described by him as the most majestic tree of Guiana. The timber is said to be equal to oak of the finest quality. It is already a considerable article of commerce, under the name of *mora wood*. It is darker than mahogany. It is valued for ship-building.

MO'RA (Lat.) is a word often used in Scotch law to denote delay caused by negligence. In England and Ireland the corresponding word is laches (q.v.).

MORA, a co. in n.e. New Mexico, adjoining Texas; 4000 sq.m.; pop. '90, 10,618. Co. seat, Mora.

MORA, Francis, D.D., b. near Vich, Spain, abt. 1833; studied theology at Vich; came to the U. S., and was ordained a Rom. Cath. priest, 1856. After holding several charges, he became rector of the pro-cathedral of Los Angelos, Cal., 1863; and vicar general of the diocese, 1865; was consecrated bp. of Mossynopolis and coadjutor bp. of Monterey and Los Angelos, 1873, succeeded to the latter see, 1878, and resigned, 1896.

MORA'CEÆ, a natural order of exogenous plants, or, according to many botanists, a sub-order of *urticeæ* (q.v.). The moraceæ are trees or shrubs with rough leaves and sometimes with climbing stems; they have a milky juice; the flowers are very small; the fruits of many flowers are often inclosed in a succulent receptacle, or the calyx becoming fleshy, all the fruits of a head or spike become combined into one. There are about 200 known species, natives of temperate and tropical climates. Some are valuable for their fruit, some for the caoutchouc obtained from their milky juice, and dif-

ferent parts of others are applied to various uses. Among the species are figs, mulberries, Osage orange, fustic, and contrayerva.

MORAINE'. The masses of rock which, by atmospheric action, are separated from the mountains bounding the valleys along which glaciers flow, find a temporary resting-place on the surface of the ice, at the margin of the glacier, and are carried along with it, but so slowly that they form a continuous line along each margin. These lines of débris are called *lateral moraines.* When two glaciers unite, the two inner moraines unite also, and form one large trail in the middle of the trunk glacier, and this is called a *medial moraine.* A large portion of these rocky fragments at length reaches the end of the glacier, and here the melting ice leaves it as a huge mound, which is known as a *terminal moraine.*

The great terminal moraine in the U. S., marking the boundary between the glaciated and the non-glaciated part of the country, has been accurately determined in many portions of its extent. Beginning on the e. with the backbone of Cape Cod, it extends down to, and follows the backbone of Long Island across to Staten Island, thence across the state of N. J.; enters Penn. near Belvidere, takes first a w. and then n.w. course, crossing the Lehigh river a few miles n. of Mauch Chunk. It reaches up into the state of New York, then takes a s.w. direction, and re-enters Penn. Leaving Penn., it has been traced across O., Ind., and Ill. It has been found in Wis. and Minn.; but its western line has not been so accurately determined as the eastern.

MORALES, Luis de, 1509–86; b. Spain; studied the works of the Spanish masters, and was called *El Divino,* "the divine," from his preference for sacred subjects. His Saviors and Magdalenes are exact representations of suffering borne with meekness. His best work is the "St. Veronica" in the church of the Barefooted Trinitarians in Madrid.

MORALITIES. See Mysteries.

MORALS. See Ethics.

MORAN, Benjamin, b. Penn., 1820; at first a printer in Philadelphia. He made a tour of England, on foot, in 1850, publishing an account of it in 1853, under the title of *The Footpath and the Highway.* In 1854 he became private secretary to James Buchanan, then American minister to England. In 1855 he was appointed secretary of the American legation in London, where he remained till 1874, when he became minister to Portugal, which post he still retained till 1882. He d. 1886.

MORAN, Edward, b. Lancashire, Eng., 1829; removed with his parents while young to Philadelphia, and became a pupil there of James Hamilton, a well-known marine painter. His work early indicated much aptitude for this class of subjects, and his paintings were of a good order of merit from the first. He went to London in 1862, remained abroad long enough to profit by the study of the great marine painters of England and the continent, and returned to reside in New York in 1869. His works have found steady sale, and have frequently been the originals for engravings. Among them are "Outward Bound," "Launch of the Life-Boat," "The Burning Yacht," "Minot Ledge Light," "The Coming Storm in New York Bay," "Solitude," and "Dream Life." Mr. Moran is careful in the finish of his pictures, and has confined his brush almost exclusively to marine subjects. He is an associate of the national academy of N. Y., and a member of the society of American artists.

MORAN, Peter, b. Lancashire, Eng., 1842; brought by his parents to Philadelphia, where he was educated, and then put with a lithographer to learn his art. He did not like it; and deserted it for the studios of his elder brothers, where he found his vocation in a field slightly different from theirs and yet allied. His taste led him to pastoral and quiet scenes in country life, and especially to animal painting, though he has not confined himself to still-life pictures. "Twilight," "The Return of the Herd," "The Thunderstorm," "Fog on a Sea-Shore," and "Settled Rain," are the names of a few of the paintings which have given him celebrity, and indicate his appreciation of the poetic aspects of still-life in nature. The "Return of the Herd" received a medal at the centennial exhibition.

MORAN, Thomas, b. in Lancashire, Eng., 1837. When seven years old his family went to Philadelphia, where Thomas was educated in the city schools, and then apprenticed to Mr. Scattergood, an engraver. During this apprenticeship he devoted all his spare time by day to painting in water colors and the study of painting, and his evenings to drawing. His success was immediate; his water-color paintings sold quickly at good prices. When master of water-colors, and studying from nature, he perceived the greater range of oil painting, and at 23 years of age turned his attention to that department. When 25 he visited England. In 1866 he again went to Europe, visited England, France, and Italy, and remained several years for work. He returned in 1871 and joined Prof. Hayden's party of exploration to the head waters of the Yellowstone river, where he made the sketches from which he produced the picture of the "Grand Cañon of the Yellowstone," purchased by congress, and now filling a panel in the capitol at Washington. The following year he visited the Yosemite and the Sierras of California and Nevada. In 1873 he joined the U. S. exploring expedition, conducted by Maj. J. W. Powell, which surveyed the wonderful canyons of the Colorado river in Colorado and Utah, and on his return completed a picture of "The Chasm of the Colorado," which was purchased by congress as a companion to the Yellowstone picture. The following year he visited the Mountain of the Holy Cross in Colorado, and on his return

to New York, where he has made his residence, he finished a picture of that mountain, which ranks as one of his grand works. These are a few of Mr. Moran's large works. Of smaller pieces he has been a prolific worker in every department of landscape art. Among these are: "The Lost Arrow," "The Ripening of the Leaf," "Dreamland," "The Groves were God's First Temples," "The Pictured Rocks of Lake Superior," "The Conemaugh in Autumn," "The First Ship," "The Flight into Egypt," "The Remorse of Cain," "The Children of the Mountain," "The Track of the Storm," "Ponce de Leon in Florida," "New York from Communipaw," and "After a Thaw." It is to Mr. Moran's skilled pencil that the world is indebted for the superb illustrations on wood that adorn the reports of both Hayden's and Powell's explorations and the most spirited recent engravings of Rocky Mountain scenery. "The Wonders of the Yellowstone," which have been illustrated in chromo by L. Prang & Co., are from his water-color sketches. Mr. Moran's style is marked neither by over-care nor by carelessness of finish. In the "After a Thaw," a locomotive on the flushed flats of New Jersey, seen through a spring mist, becomes a picture of poetic beauty.

MORAT (Lat. *Moratum*, Ger. *Murten*), a town of about 3000 inhabitants, in the canton of Freiburg, Switzerland, on the lake of Morat, 8½ m. n. by w. of Freiburg, famous for the victory of the Swiss and their allies over Charles the Bold, duke of Burgundy, June 22, 1476. The duke, exasperated by his defeat at Grandson in March, appeared before the gates of Morat with 40,000 men. The Swiss were aided by Strasburg, Basel, Colmar, and other Rhenish cities, and by duke René of Lorraine, whom the duke of Burgundy had driven from his possessions; but the superiority of numbers was greatly on the side of the duke of Burgundy. The assault of the Swiss, however, was very impetuous, and their victory complete; the duke's camp fell into their hands, and he himself only escaped by the swiftness of his horse.

MORATA, Olympia Fulvia, 1526–55; b. Ferrara; was carefully educated, and became an accomplished classical scholar. She is said to have given lectures on classical subjects at Ferrara in her 16th year. She afterward married a German physician named Andreas Grundler, and was converted to Protestantism. In 1553 margrave Albert of Brandenburg pillaged Schweinfurt, where she was living, and she lost her library, and was forced to take refuge in Hammelburg. Grundler was presently appointed a professor at Heidelberg, where she went to reside. She published many poems, written in Greek or Latin and mostly on religious subjects.

MORATIN, Leandro Fernandez de, the most eminent comic poet that Spain has produced in recent times, was b. at Madrid Mar. 10, 1760. His father, Nicolas Fernandez de Moratin, was also a poet of some eminence, but having found that literary labors afforded a precarious support, he wished his son to learn the trade of a jeweler, by which, after his father's death, he, in fact, for some time supported himself and his mother. In 1790 appeared his first and best comedy, *El Viejo y la Niña;* it was followed by *La Comedia nueva*, *El Baron*, *La Mogigata*, and *El si de las Niñas*. Prince Godoy conferred several ecclesiastical benefices upon him, though the Inquisition set its evil eye upon the poet. Joseph Bonaparte made him chief royal librarian; and after 1814 he took refuge in Paris. His last work was the *Origenes del Teatro Español*. He died in Paris June 21, 1828.

MORATIN, Nicolas Fernandez de, 1737–80; b. Madrid; a friend of Montiano, the restorer of classical tragedy in Spain. Following the example of Montiano and Luzan, he attempted to reform the drama, and to purge it of romanticism. In 1762 he published three discourses against the older drama, under the title of *Desengaños al Teatro Español*. In these discourses he bitterly attacked the old characteristic *Autos Sacramentales*, which were suppressed by the government in 1765. In the same year that the discourses appeared he wrote a comedy, *La Pentimétra*, in the French manner: neither this, nor his tradgedy *Lucrecia*, was represented, on account of the strong prejudice then prevailing in Spain against French innovations. In 1770 he succeeded in having his tragedy of *Hormesinda* produced on the stage, and it was favorably received. He wrote but one more tragedy, *Guzman el Buene*, which was never performed. Before this, he had turned his talents in the direction in which he was to do his best work, and had published, in 1764, a collection of verses called *El Poéta*. This was followed the next year by *Diana*, a didactic poem on the chase. His most important work, a historical epic called *Las Náves de Cortèz Destruidas*, appeared the same year. Moratin at first practiced law, but was afterward made professor of poetry in the imperial college at Madrid. He formed a club, which met at Madrid and considered the productions of contemporary literature. He was on intimate terms with the chief scholars and authors of Spain —Cadahalso, Ayala, Montiano, the botanist Ortega, and Fajardo, the translator of Buffon. His posthumous works were published by his son Leandro, in 1821.

MORATORIUM. A modern Latin term to denote an extraordinary act of a government, by which the collection of all debts is suspended for a specified time. A recent instance is the moratorium decreed by Argentina in 1890 at the time of the great financial crisis which led to the suspension of the Barings of London.

MO'RAVA, the chief river of Servia. It is formed by the union of two head streams —the eastern or Bulgarian Morava, which rises in the mountains to the s. of the new

southern frontier of Servia; and the western or Servian Morava, which rises on the western frontier. The united stream flows northward to the Danube, and has a total length of about 180 miles.

MO'RAVA, or, more properly, March (called by the ancients *Marus*), a river of Austria, has its origin on the southern slope of the Schneeberg, on the borders of Prussian Silesia, 3,882 ft. above sea-level. It is the chief river of Moravia, to which it gives its name, and flows s. through that crown-land, receiving on the right the Thaya, and falling into the Danube, 8 m. above Presburg. In its lower course, it forms the boundary between Lower Austria and Hungary. Its course is 180 m. in length, and it is navigable from Göding, about 50 m. from its mouth.

MORA'VIA (Ger. *Mähren*), a crown-land of the Austria-Hungarian kingdom, situated in 48° 40′ to 50° n. lat., and 15° 5′ to 18° 45′ e. long. It is bounded n. by Prussian and Austrian Silesia, e. by Hungary and Galicia, s. by the duchy of Austria, and w. by Bohemia. The superficial area is about 8,583 sq. m.; and the pop. in '91 was 2,276,870.

Moravia is inclosed and traversed on all sides by mountains, being separated from Silesia by the range of the Sudetes; from Bohemia, by the Moravian chain; and from Hungary, by the Carpathian mountains; while branches of these various chains intersect the whole country except in the s., where the land consists of extensive plains, lying about 800 ft. above the level of the sea. The numerous small rivers of the interior follow a s.e. direction, and fall into the March or Morava, from which the country derives its name, and then flow together with the latter into the Danube. The Oder, and its affluents the Elsa and Oppa, rise among the mountains on the n.e., from whence their course is soon turned directly away from the Moravian territory. There are few extensive lakes, but numerous ponds and small streams, which abound in fish. The more elevated parts of the country are not fertile, and the climate is severe; but in the mountain valleys and on the southern plains the soil is remarkably rich, and the temperature more genial than in other European countries lying in the same parallel. Moravia, which ranks as one of the richest of the Austrian dominions, has 71% of its area in arable land. It yields fine crops of grain, and among the other natural products grown for exportation we may instance hops, mustard, potatoes, clover-seed, beet-root; and in the s., maize, grapes, chestnuts, and many other of the less hardy fruits and vegetables. The breeding of cattle and sheep, and the making of cheese from sheep's milk, constitute an important branch of industry; in the southern districts of the Hanna (a plain famous for its fertility), horses are bred for exportation. Geese and fowls are reared in large numbers for the sake of their feathers, and the keeping of bees is conducted with great success. The mineral products include iron, alum, saltpeter, coal, graphite, wetstones, sulphur, vitriol, pipe-clay, marble, and topazes, garnets, and other precious stones.

Industry, etc.—The principal branches of industry are the manufacture of linen and thread, which now enjoy a European reputation, and those for cotton goods at Sternberg. Moravia has long been noted for the excellence of its cloths, flannels, and other woolen fabrics, and for its leather goods. The minerals of Moravia, especially coal and iron, are important, and are extensively wrought. Beet-sugar is largely manufactured. Brünn (q.v.), the capital, is the chief emporium for the manufacturing trade, and Olmütz (q.v.) the principal cattle-mart.

The educational wants of the province are provided for by gymnasia and a great number of schools. The former university at Olmütz is now represented by a theological faculty, and by a large technical institute. The majority of the people belong to the church of Rome.

In regard to nationality, the population may be divided as follows: About 500,000 Germans, over a million and a half of Slavs, and 50,000 belonging to other races (including Jews). The Slavs of Moravia are mostly Czechs, with Poles and a few Croats. The Czechs are inferior in all respects to their brethren in Bohemia. The Moravian Poles, although inferior to the Germans as regards industry and cultivation, are a physically well developed, courageous, and enterprising people.

History.—Moravia was anciently occupied by the Quadi, who, on their migration in the 5th c. to Gaul and Hispania, were replaced first by the Rugii, next by the Heruli and Longobardi, and finally by a colony of Slavonians, who, on their settlement in the country, took the name of Moravians, from the river Morava. Charlemagne, who brought the people under nominal subjection after they had spread themselves over a territory greater than the present Moravia, constrained their king, Samoslav, to receive baptism; but Christianity was first formally established in the middle of the 9th c. by Cyril, who must be regarded as the true apostle of the land. Moravia was made tributary to the German empire before the close of the century; but in 1029 it was incorporated with Bohemia, after having for a time been a prey to the incursive attacks of its Slavonic and Teutonic neighbors. At the close of the 12th c. Moravia was erected into a margraviate, and declared a fief of Bohemia, to be held from the crown by the younger branches of the royal house. On the death of Louis II. at the battle of Mohacz in 1526, Moravia, with all the other Bohemian lands, fell to Austria, in accordance with a pre-existing compact of succession between the royal houses. Since then it has shared the fortunes of the empire, and in 1849 it was formally separated from Bohemia, and declared a distinct province and crown-land.

MORAVIANS (called also *United Brethren*, *Moravian Brethren*, or *Bohemian Brethren*), a religious community, tracing its origin to the followers of John Huss, who were expelled by persecution from Bohemia and Moravia in the beginning of the 18th c., and of whom a small company, consisting at first of only 10 persons, received permission from count Zinzendorf (q. v.), in 1722, to settle on his estate of Berthelsdorf, in Saxony. To this settlement they gave the name of Herrnhut, whence they are commonly known in Germany as Herrnhuters. It rapidly increased, not only by the accession of additional Bohemian and Moravian refugees, but also of other Christians, who were attracted by the faith and piety which remarkably prevailed in it. Zinzendorf joined the little brotherhood, devoted his whole estate to the propagation of Christianity, and undertook the work of the ministry. The doctrines which they received being those of the Augsburg confession, it was proposed that they should unite themselves with the Lutheran church; but a difference of opinion existing on this point, it was decided, as difficult questions often were, until 1890, among the Moravian, by an appeal to the lot; and the result was, that the United Brethren, or *Unitas Fratrum*, as they termed themselves, remained a distinct community, and adopted an organization of their own. Till Zinzendorf's death in 1760, he was really their leader, and was recognized by them as *ordinarius*. After his death, their organization was completed by synods held in 1764 and 1769.

The Moravians are recognized by the state in Germany, as Protestants attached to the Augsburg confession. They have no symbolical books of their own, although they drew up a simple and brief confession of their faith in 1727, and a brief statement of principles was emitted by a synod held in 1775.

The Moravians profess to be connected with the Bohemian or Moravian Brethren of former times by a regular succession of bishops. The bishops, however, exercise no episcopal authority, and their chief peculiar function is that of ordination, of which they alone have the power. Every congregation is governed by a Conference of Elders. The elders are bound to visit each family once in three months, and to report concerning the maintenance of family worship and the conduct of the brethren. It is also their duty to visit the sick, and to aid the poor with money contributed by the other brethren. The Unitas Fratrum is divided into three provinces: the German, British, and American, which are independent in local affairs, but form one organization for the control of doctrine, discipline, ritual, and foreign missions. The provincial synods meet at fixed times, and provide for all matters of administration among themselves. At intervals of ten or twelve years the general synod of the whole body is held at Herrnhut in Saxony. It consists of nine delegates from each province, of delegates from the foreign missions, and of certain *ex-officio* members. It elects a board of twelve bishops to oversee the whole church in general matters, and to superintend the foreign missions. Between one synod and another, all affairs are managed by a Conference of Elders appointed by the synod.

Moravians are to some extent scattered amongst the general population of the countries in which they dwell, as Britain and America; but they prefer, where it is possible, to live in colonies, or separate societies, and in these they carry out some very peculiar parts of their organization, particularly a division into "choirs" of children, youths, maidens, unmarried brethren, unmarried sisters, widowers, and widows, each having a separate leader or pastor. Unmarried brethren, unmarried sisters, widowers, and widows, reside in separate houses; married couples in houses of their own. Colonies of Moravians exist in England, America, Holland and other countries, but are most numerous in Germany. The most important colonies, however, are perhaps those in the mission-fields. The Brethren early entered on missionary work, and all the prosperity of their church has been evidently connected with their earnest prosecution of it. Their first mission was planted, in 1732, in the island of St. Thomas, in the West Indies; the missionaries who went thither expressing their resolution to become slaves, if necessary, in order to carry out their purpose. A mission to Greenland, which has been eminently successful, and may be said to have made Greenland a Christian country, was commenced in 1733. They have also interesting missions in Labrador and at the Cape of Good Hope, and in other heathen countries. The Moravians have at their mission-stations about 70,000 converts from heathenism. One of the most interesting of their stations is at Sarepta, in the government of Saratov, in Russia, by which they are connected with the Tartars and Kalmucks. In all their settlements, the education of the young receives the utmost attention.

The Moravian Church in America.—Moravian emigrants went to Georgia in 1735; but five years afterwards, when troubles arose between that colony and Spain, they removed to Pennsylvania, where they built the towns of Bethlehem and Nazareth. These and some smaller settlements adopted the exclusive plan and even communism in labor. "The lands were the property of the church, and the farms and various departments of mechanical industry were stocked by it and worked for its benefit. In return the church provided the inhabitants with all the necessaries of life. Those however who had means of their own retained them. There was no common treasury." This system, which was called the "Economy," existed for twenty years, during which time it produced great results. Each member of it was pledged to devote his time and powers in whatever direction they could be best applied for the spread of the gospel. By this means there went forth a succession of missionaries through the colonies and among the Indians, preaching salvation by Christ, while the work at home of farmers and mechan-

ics provided for their support. Though the Economy was of short duration, the exclusive foreign policy was continued 80 years. But toward the middle of the present century it was gradually modified, and has now been set aside. According to statistics compiled in 1891 the number of members reported from the American provinces was over 11,358, and of souls connected with the church, 20,000. In the whole United States they had 101 regular churches, 114 ministers, and many boarding schools designed for young people not connected with the denomination. New church buildings cannot be consecrated till the building expenses have been provided for; and the right of congregations to lay representation in provincial synods is contingent upon their adequate support of their minister and their church establishment. The northern and southern provinces were united in 1881. At the present time, the American province has about 29 home missions, including 2 among the Indians in Canada and Kansas.

The religious services of the Moravians are conducted with great simplicity. They meet for worship daily, in the evening, the service being much like that of a *prayer-meeting* amongst other Christians. They use a litany on the Lord's day, but extemporary prayer is frequent. They admit the use of instrumental music. They long maintained the practice of washing the feet, in choirs and in congregations, before the communion. They meet on the last day of the year, to bring in the New Year with prayer and other exercises of religion. On Easter morning they assemble in the burying-ground to celebrate the resurrection of Christ, and to express their confidence concerning the brethren who have died during the preceding year. The death of a member of the brotherhood is made known in the chief settlements by sound of trumpets, as if for victory; the melody indicating the particular choir to which the deceased belonged. In some of the settlements peculiar dresses are worn by the members of particular choirs.

In the three home provinces (German, English, American) there were in 1890, in all, 166 congregations, and nearly 32,000 communicants. In foreign missions (including one in Bohemia and Moravia) were 111 stations, 343 missionaries, 1659 native agents, and 29,971 communicants. There is an important leper mission in Jerusalem. See histories in German by Goll (1882); in French by Bost (1844, English transl.); and in English by Schweinitz (1825); see also *Moravian Schools and Customs* (1889).

MORAY, Earl of. See Murray.

MO'RAY FIRTH, and indentation of the German ocean, on the n.e. coast of Scotland. Its n.w. shore is formed by the counties of Ross and Cromarty, and extends from Kessock ferry, opposite Inverness, to Tarbet Ness. Its s.e. shore extends from Inverness to Burghead, in Elginshire. The entrance of the firth between Burghead and Tarbet Ness is 16 m. in width; and from its entrance to Inverness it is 31 m. in extent. The firth is continued westward from Inverness by a branch called Beauly basin.

MORAYSHIRE. See Elginshire.

MORAZAN', Francisco, 1799–1842; b. in Honduras, his father being of Corsican descent. At an early age he began to be active in the troubled politics of Central America, and when but 25 years old was made secretary-general of Honduras; and soon after, having shown himself both a good soldier and a keen statesman, he was elected governor of the state. At that time the liberal party was in power, but constant insurrections were incited by the reactionary factions. These factions Morazan met with firm military measures, and in 1829 drove them out from the city of Guatemala, a service rewarded by the congress with the title of "saviour of the republic." In 1830 he accepted the presidency of the Central American Confederation. He was entrusted with unusual powers, but governed well. He used his authority in ridding the country of the curse of monasticism, abolished convents and tithes, and had the boldness to expel the archbishop of the diocese and other church dignitaries. In 1832 he repelled an invasion from Mexico, and in 1834 was re-elected to the presidency. But he had underrated the power of the church; the prevalence of the cholera gave the priests a pretense to inflame the minds of their most ignorant devotees, mostly Indians, with preposterous tales of poisoning and the "vengeance of heaven." A general rising took place, Morazan was overpowered, and, in 1840, compelled to flee to Peru. In 1842 he went to Costa Rica and was made governor without opposition. Still adhering to the idea of federation of the states of Central America, he soon lost his popularity; again a sudden insurrection was incited and Morazan fell a victim, being court-martialed and shot on Sept. 15, the anniversary of the federation in 1823 of the five independent states.

MORBIHAN, a department in the n.w. of France, formed out of ancient Bretagne. Area, 2,625 sq. m.; pop. '96, 552,028. The coast is much indented, and has a multitude of bays, roadsteads, harbors, and islands. The largest island is Belle-isle-en-Mer (q.v.). The department has a somewhat hilly appearance, but towards the sea the land stretches out in rich plains, interrupted, however, by great tracts of heath and marsh. The climate is mild but moist. The soil is not well cultivated, but yields sufficient grain for home consumption. The heaths afford fine pasturage, and support great herds of horned cattle, sheep, and horses. The rearing of bees is a source of very considerable revenue, as also are the river and coast fisheries. The trade in sardines is particularly extensive. The want of wood is so great that the peasants are obliged to

burn dung extensively. The chief mineral is iron, but there are almost no manufactures. Morbihan is divided into the four arrondissements of Vannes, Lorient, Ploërmel, and Pontivy. The chief town is Vannes (q.v.), but the most populous is Lorient (q.v.).

MORDANTS. See DYEING.

MORDAUNT, CHARLES, Earl of Peterborough, military and naval commander, and one of the most brilliant Englishmen of his time, was the son of John, Lord Mordaunt, and was born in 1658, some say 1662. He served as a boy in the navy, and then entered the army. He took part against James II., and was made earl of Monmouth by William III., succeeding afterwards to the earldom of Peterborough, as heir to his uncle. During the war of the Spanish succession the English government determined to send an expedition to Spain. It was placed under the command of Mordaunt, and in June, 1705, he arrived in Lisbon with 5,000 Dutch and English soldiers. After taking on board the archduke Charles of Austria, who claimed the Spanish crown, the armament proceeded to Valencia. Here Mordaunt, with characteristic daring, conceived the idea of making a dash at Madrid, and finishing the war at one blow. He was overruled by the archduke and the Prince of Hesse, and compelled to besiege Barcelona, which was defended on one side by the sea, and on the other by the strong fortifications of Monjuich. By a *coup de main* he made himself master of Monjuich. Barcelona fell, and Mordaunt, with a handful of men, entered one of the strongest cities of Europe. He pushed his successes into the interior. Several towns submitted. He marched to Valencia in the depth of winter, and at the head of 1200 men defeated a Spanish force of 4,000. The Spaniards sent a large army into Catalonia, and a French fleet appeared off Barcelona. Mordaunt harassed the enemy's army, and putting himself on board the English squadron, directed a movement which, had it been executed a few hours earlier, would have resulted in the capture of the whole French fleet. The Frenchmen put to sea, and Barcelona was saved. Mordaunt again wished to march towards Madrid, but his plan for gaining possession of the capital was once more rejected by Charles. He accordingly left the army in a fit of pique, and went to Italy. In 1707 he returned to Valencia as a volunteer, and gave excellent advice, which was not followed. He was recalled to England, and from that moment the tide of fortune ran strong against the Austrian cause. Few generals have done so much with means so small, or displayed equal originality or boldness. His fertility and activity of mind were admirably seconded by a most intrepid spirit. His splendid talents, on the other hand, were disfigured by vainglory, and a morbid craving for novelty and excitement. He loved to fly round Europe, and was said to have seen more kings and postilions than any other man of his day. On his return he made common cause with the tories, to spite the duke of Marlborough, and received the garter and other dignities for his services. On the accession of George I. he was appointed commander-in-chief of the naval forces of Great Britain; He died at Lisbon, Oct. 25, 1735. His witty yet affectionate letters to Pope, Swift, Prior, etc., give a fine insight into his private character. See Eliot Warburton's *Memoir of Charles Mordaunt, Earl of Peterborough and Monmouth, with Selections from his Correspondence,* 2 vols. (1853). His character has been sketched by Horace Walpole, in his *Catalogue of Royal and Noble Authors,* and with still greater force and picturesqueness by Macaulay.

MORDECAI, ALFRED, b. N. C., 1804; graduated at West Point in 1823, and remained there the two following years as professor of philosophy and of engineering. In 1855 he was sent by the government to the Crimea as a member of the military commission, and his report was published by congress in 1860. In 1863–66 he was assistant engineer of the Mexico and Pacific railroad. He was the author of several technical works, the chief of which is an *Ordnance Manual.* He d. in 1887.

MORDVINS, a people in e. Russia, between the Oka and Volga rivers. They belong to the Volgaic division of the Finns. Their number is estimated at 400,000. A grammar of their language was published by Ahlquist at St. Petersburg, 1871.

MORE, HANNAH, the daughter of a village schoolmaster, near Bristol, was b. in 1745. She wrote verse at an early age; and in 1773, she published a pastoral drama entitled *The Search after Happiness;* and the year after, her tragedy of *Regulus.* Under the idea that she was possessed of dramatic talent, she was introduced to Garrick, and through him became acquainted with Dr. Johnson, Burke, and sir Joshua Reynolds. Deeply impressed with the importance of religion, she gradually resigned her ambition to shine as a writer for the stage, and after the publication of her *Sacred Dramas,* she retired to the country, and busied herself with the composition of works of a more serious and practical cast, the best remembered of which are, *Cœlebs in Search of a Wife,* and *The Shepherd of Salisbury Plain.* She died at Clifton, on Sept. 7, 1833. Her *Memoirs and Correspondence* were published in the following year, in 4 volumes.

MORE, HENRY, D.D., 1614–87; b. Grantham, Lincolnshire, Eng.; studied at Eton, where beside his regular studies he spent much time in reading the philosophical works of Aristotle and Julius Scaliger; entered Christ college, Cambridge, at the age of 17, and graduated in 1635. During all his college course he devoted himself with great zeal to philosophy, saying to some one, "I immersed myself over head and ears in the study of philosophy, promising a most wonderful happiness to myself in it." He found no rest to his mind in any system, but became more and more perplexed and skeptical, until he

came to the writings of Plato and the Platonic writers, and "discovered the long-looked for treasure in the dreamy pages of Marsilius Ficinus, Plotinus and Trismegistus." In 1639 he took the degree of master of arts, and became tutor to several persons of distinction. He declined many important offers in the church, preferring a quiet life at Cambridge and the study of philosophy even to the honors of a bishopic at £1500 a year. He resigned the rectory of Ingoldsby in 1642, declined the mastership of his own college in 1654, and though he accepted a prebend in the church of Gloucester in 1675, he soon resigned it. In 1640 he published *Psychozoia or the First part of the Song of the Soul, containing a Christiano-Platonical display of life.* This was reprinted in 1647, and with some additional pieces under the title of the *Philosophical Poems.* His next work was *Conjectura Cabalistica,* and the *Philosophiæ Teutonicæ Censura,* at the request of Lady Conway, a noted disciple of William Penn. He secured her friendship, and received from her a legacy of £400, which he devoted to private charity. In 1671 he published *Enchiridium Metaphysicum,* in which he inveighed against Cartesianism. His other principal works are *Enchiridion Ethicum Metaphysicum; The Mystery of Iniquity; A Key to the Revelation; An Apology for Descartes; The Immortality of the Soul; Enthusiasmus Triumphatus; The Mystery of Godliness,* which for 20 years had a great sale. £300 were left by an admirer of his works to have some of More's pieces translated into Latin, which led the author to publish all his works in Latin in 3 folio vols. in 1679. His last work *Medela Mundi* he did not live to finish. The greater number of his works appeared in English under the title of *A Collection of several Philosophical Writings,* folio. *The Life of the Learned and Pious Dr. Henry More* was written by the Rev. Richard Ward. Though a mystical philosopher, he was a man of great intellectual power, profound learning, and rare excellence of character. He was one of the first fellows of the royal society, and was a correspondent of Descartes.

MORE, Sir THOMAS, lord chancellor, and one of England's worthiest sons, was b. in Milk street, London, in 1478, son of sir John More, justice of the Queen's Bench. He was educated at St. Anthony's School, Threadneedle street; and in his fifteenth year was placed in the house of Cardinal Morton, archbishop of Canterbury, who used to say of him: "This child here waiting at the table, whosoever shall live to see it, will prove a marvelous man." Dean Colet, too, was wont to say: "There was but one wit in England, and that was young Thomas More." In 1497 More went to Oxford, where he made the friendship of Erasmus. He then applied himself to the law, and studied first at New Inn, and afterwards at Lincoln's Inn. He was appointed reader at Furnival's Inn, where he lectured for three years. At the accession of Henry VIII., his professional practice was considerable, and he also held the office of judge of the Sheriff's court in the city—his income from these sources being equivalent to $20,000 or $25,000 of present U. S. money. He went on several missions abroad for the king, and in 1516 was made a privy-councilor. His public life now began. He became so great a favorite with Henry VIII., that, in the words of Erasmus, "the king would scarcely ever suffer the philosopher to quit him." Henry visited him uninvited at Chelsea, and walked with him by the hour in his garden, "holding his arm about his neck." Yet More had a true insight into Henry's character, for being congratulated on the king's favor by his son-in-law, Roper, he replied: "If my head would win him a castle in France, when there was war between us, it should not fail to go." More is the first person in British history distinguished by the faculty of public speaking, and remarkable for the successful employment of it in parliament against a lavish grant of money to the crown. Being elected speaker of the house of commons in 1523, he vindicated the ancient liberties and privileges of the house against Cardinal Wolsey, who rather feared than liked him. In 1529, when the prosecution was opened against Wolsey, the king delivered the great seal to More at Greenwich, constituting him lord chancellor, a dignity that had generally been held by ecclesiastics, and had never yet been filled by a common lawyer. When he was seated in his court of chancery, his father, sir John More, who was nearly ninety, was the oldest judge of the King's Bench. It was a beautiful spectacle to "see the son ask the blessing of the father every day upon his knees, before he sat upon his own seat." Unlike the haughty Wolsey, whom no suitor would approach without offerings, More sat daily in an open hall, that he might receive in person the petitions of the poor. He dispatched the causes so speedily and diligently, that on asking for the next, he was told that none remained. Henry in vain endeavored to obtain More's authority for his divorce with Catharine of Aragon, and his marriage with Anne Boleyn, upon which he had set his heart. As soon as the progress of the marriage was so far advanced that the active co-operation of a chancellor was required, More obtained leave to resign the great seal. When the king "by no gentleness could win him," his favor turned to fury. More refused to take an oath which pledged him to the lawfulness of the king's marriage with Anne Boleyn. He was committed to the Tower, where he remained thirteen months. On May 6, 1535, he was brought to trial at Westminster. It has been truly said that "no such culprit had stood at any European bar for a thousand years." He was convicted by the most flagrant perjury and injustice, and sentenced to the savage punishment for high treason. He suffered death in the Tower, July 6, 1535. In the words of Addison: "The innocent mirth which had been so conspicuous in his life did not forsake him to the last. When he laid his head on the block, he desired the execu-

tioner to wait until he had removed his beard, 'for that had never offended his highness.'" His head was placed on London Bridge, but was taken down and preserved by his favorite daughter, the admirable Margaret Roper, the story of whose tenderness and devotion will live as long as the English language endures. His *Utopia* is the conception of an imaginary commonwealth, in which opinions are expressed with great boldness and originality, and especially favorable to freedom of inquiry, even in religion. He, however, wrote against the Lutherans, and corrected the MS. of Henry's answer to Luther. The terseness and liveliness of his sayings, his sweet temper and affectionate disposition, his blameless life, his learning and probity, combine to make a union of perfect simplicity with moral and intellectual greatness, which will for ever endear his memory to his countrymen of every sect and party.

MORE'A, the name borne by the ancient Peloponnesus (q.v.) since the Middle Ages, if not from as early a period as the 4th century. It is usually said to be derived from *morus,* a mulberry—the outline of the peninsula bearing a resemblance to the leaf of that tree; others, however, such as Fallmerayer, trace it back to the Slavic word *more,* the sea, which nearly encircles the Morea. The Morea forms the most southern part of the kingdom of Greece, and is divided into the nomarchies of Argolis, Corinth, Laconia, Messenia, Arcadia, Achaia, and Elis.

Overrun by the Goths and Vandals, it became a prey, in the second half of the 8th c., to bands of Slavic invaders, who found it wasted by war and pestilence. Gradually, however, these barbarians were subdued and Grecianized by the Byzantine emperors. Nevertheless, the numerous names of places, rivers, etc., in the Morea of Slavic origin, prove how firmly they had rooted themselves, and that the Moreotes are anything but pure Greeks. In 1207 the peninsula was conquered by French knights, and Achaia was formed into a principality with all the feudal institutions of the west. After 1261 the Byzantine emperor, Michael VIII. Palæologus, reconquered part of the country; but the principality of Achaia remained in the family of Villehardouin till 1346, when the male line became extinct. Various claimants now arose, and much strife and confusion ensued. At length, in 1460, the greater portion of the Morea fell into the hands of the Turks, who retained possession of it down to the period of the Greek revolution, except from 1687 to 1715, when it was held by the Venetians. The long struggle between the Turks and Venetians diminished the population so much that in 1719 it had only 200,000 inhabitants, and the plagues of 1756 and 1782 even reduced it to half this number. After the French revolution, however, it began to increase; at the outbreak of the war of independence, in 1827, it had reached 300,000, of whom only one-sixth were Turks; in 1880 it was 745,000, and in 1889 it was 814,000.

MOREAU, Hegesippe (1810–1838) a French poet, was educated by a bookseller in Provins, went to Paris where he found employment in the publishing house of the Didots and turned his attention to authorship. He suffered the greatest privations, and died in a hospital just as his talent began to be appreciated. His works comprise *La Voulzie,* elegies; *La Fermière,* a novel; *Contes à Ma Soeur;* and some prose romances, of which the most notable is *Le Gui de Chêne.* His works appeared under the title of *Myosotis;* and his correspondence in the first volume of his *Œuvres complètes* (1890–1).

MOREAU, Jacques Joseph, m.d., 1844–1884, a French alienist; studied at Tours and Paris, where he received the degree of M.D. in 1830. He traveled in the east in 1832, and, returning to Paris, in 1840 he became attending physician at the insane asylums of Bicêtre and Salpêtrière. He published *Du Hachisch et de l'Aliénation Mentale* (1845); *Traité Pratique de la Folie Neuropathique* (1869); and from 1855 to 1862 was co-editor of the *Annales Médico-psychologiques.*

MOREAU, Jean Victor, the greatest general of the French republic, except Bonaparte, was born Aug. 11, 1763, at Morlaix, in Bretagne; was the son of an advocate, and was sent to study law at Rennes. He took the side of the revolution, was chosen to command the battalion of volunteers from Rennes, served under Dumouriez in 1793, and displayed such military talent, that in 1794 he was made a general of division. His father was put to death by the guillotine under the reign of terror, and Moreau hesitated for a moment, but resolved that he could not withdraw from the service of his country. When Pichegru fell under suspicion, the directory appointed Moreau, in the spring of 1796, to the chief command on the Rhine and Moselle. He crossed the Rhine at Kehl, defeated Latour at Rastadt, and the archduke Charles at Ettlingen, and drove the Austrians back to the Danube. But, owing to errors in the plan of the campaign, against which he had in vain remonstrated with the directory, Moreau found himself in danger of being cut off from the Rhine, and was obliged to make a desperate effort to regain that river, which he accomplished, notwithstanding great difficulties, by a march of forty days. This retreat established his reputation for generalship more than all his previous victories.

A suspicion of participation in the plots of Pichegru led to his being deprived of his command, after the *coup d'état* of 18th Fructidor. In the following year he succeeded Schérer in the command of the army in Italy, when it was hard pressed by the Russians and Austrians, 25,000 men being opposed to 80,000. By a retreat conducted with consummate skill, and in course of which he even gained victories, he saved the French army from destruction. The directory, nevertheless, deprived him of the chief command, and gave it to Joubert. But Moreau remained with the army, and aided that young general to the utmost; and after his death at Novi, again assumed the command,

and conducted the defeated troops to France. The noble disinterestedness of Moreau's character, his military talent, and his political moderation, induced the party which overthrew the directory, to offer him the dictatorship of France, which he declined, and lent his assistance to Bonaparte on 18th Brumaire. Receiving the command of the army of the Rhine, Moreau gained victory after victory over the Austrians in the campaign of 1800, and at last won the great and decisive battle of Hohenlinden (q.v.). A strong feeling of mutual distrust now arose between Moreau and Bonaparte, who sought in vain to win him to himself; and Moreau's country-seat, to which he retired, became the gathering-place of the discontented. Bonaparte surrounded him with spies, and ere long he was accused of participation in the plot of Cadoudal (q.v.) and Pichegru against the life of the first consul. He was arrested, brought to trial, and found guilty on 10th June, 1804, although the evidence against him was utterly insufficient. But Bonaparte could not venture upon a sentence of death, and a sentence of two years' imprisonment was therefore pronounced, which was commuted into banishment, and Moreau went to America, where he settled in New Jersey. Regarding with great dissatisfaction the whole of Bonaparte's further career, he thought it his duty to France to give his aid to the allies in the campaign of 1813, and leaving the United States in the company of a Russian agent, he landed at Gothenburg, had an interview with the crown prince of Sweden, the former Gen. Bernadotte, and accompanied the emperor of Russia and the king of Prussia in the march against Dresden, where, as he stood with the emperor Alexander on a height at Raecknitz, on Aug. 27, a French cannon-ball broke both his legs. Amputation was performed, but he died at Laun in Bohemia, Sept. 2, 1813.

MOREAU DE SAINT MÉRY, Médéric Louis Élie, 1750–1819; b. in the isle of Martinique; educated in Paris; commenced life as an advocate, and not long after returned to his native island to practice his profession; amassed a fortune, and was charged by the French government to prepare a civil code for the French islands, which was published under the title, *Lois et Constitutions des Colonies françaises de l'Amerique, de* 1550 *à* 1785. Named president of the electors of Paris in July, 1789; member of the constituent assembly for Martinique in 1790; a refugee to the United States, after the dominance of the Jacobins in Paris; there became a bookseller; was called to Bonaparte's council of state in 1800; administrator of the states of Parma, Plaisance, and Guastalla, in 1802, and there fell into disgrace for lack of energy against a militia revolt. In 1806 he was granted an audience by Napoleon, and said to him: "Sire, I do not ask to be recompensed for my probity, I ask only for its toleration." He became very poor afterward, until 1817, when Louis XVIII. granted him a handsome pension. His published works are *Description de la partie espagnole de Saint Dominique* and *Description de la partie française de Saint Dominique,* both published in Philadelphia in 1796–97–98.

MORE'CAMBE BAY, an inlet of the Irish sea, on the n.w. coast of England, separates the main portion of Lancashire from the detached portion of Furness. It is about 10 m. in average breadth, and is 16 m. in length.

MOREEN. See Moire.

MOREHOUSE, a parish in n. Louisiana, adjoining Arkansas. It is bounded on the s.e. by the Bœuf bayou, on the w. by the Ouachita river, and drained by the Bœuf bayou and Bartholomew bayou; pop. '90, 16,786. Area, 845 sq. m. Co. seat, Bastrop.

MOREL, *Morchella,* a genus of fungi, of the division *hymenomycetes,* having a fistular stalk, and a roundish or conical *pileus,* the upper surface of which is divided into an irregular net-work of cells or pits, and bears the *hymenium.* They grow on the ground, and have a more or less agreeable smell and taste. Some of them are reckoned among esculent fungi, of which the best-known is the Common Morel (*M. esculenta*), a fungus found in America and common in many parts of the middle and south of Europe. Its stalk is only about an inch high, and it has a roundish, oval, oblong, or conical, yellowish or brown pileus. It is nutritious, and not difficult of digestion; but is chiefly used in sauces and gravies, on account of its pleasant flavor. It is used either fresh or dried.

MORE'LIA, or Valladolid, a t. of Mexico, capital of the state of Michoacan, in a fine valley, surrounded by high mountains, 125 m. w.n.w. of Mexico city. There is a magnificent aqueduct for the supply of water. Pop. '95, 32,287.

MORELL, George Webb, 1815–1883, an American soldier, graduated at the U.S. military academy at West Point in 1835, and upon his graduation served in the corps of engineers engaged in the improvement of harbors on Lake Erie. As second lieutenant of engineers he assisted in the boundary surveys between Ohio and Michigan, and in the construction of Fort Adams at Newport, Rhode Island, in 1836–7. He retired from the army in 1837, and for three years was occupied in the construction of railroads in North and South Carolina and in Michigan. After that time he became a lawyer, and was commissioner of the United States Circuit Court for the southern district of New York. He was in 1861 appointed chief of staff to General Edward S. Sanford, employed in organizing regiments, and was engaged at Washington and Harpers Ferry, Va. He was made a brigadier-general in the same year, and took part in the battles of Yorktown, Hanover Court House, Mechanicsville, Gaines's Mills and Malvern Hill, after which he received the appointment of major-general, which was not, however, confirmed by the senate. He was mustered out of service in 1864 and lived at Tarrytown, N. Y.

MORELL', John D., b. England, 1815; studied philosophy, upon which he has written a number of books. His *Historical and Critical View of the Speculative Philosophy of Europe* appeared in 1846; *Philosophy of Religion,* 1849; and *Elements of Psychology,* 1853.

MOREL'LA (anc. *Castra Ælia*, the winter-quarters of Sertorius), a t. and important fortress of Spain, in the province of Castellón, about 36 m. w.s.w. of Tartosa. Morella was the chief stronghold of Cabrera, who scaled the castle by ropes furnished by a partisan within, on the night of Jan. 25, 1838. It was retaken in 1840 by Espartero, after a brave defense. There are some interesting Roman and Moorish antiquities. Pop. commune, 6800.

MORE'LOS Y PAVON, José Maria, 1765–1815; b. in New Mexico; curate of a village in Valladolid. The insurrection against Spanish rule was headed by Hidalgo, and to this movement Morelos joined himself in 1810, and received a commission as capt.gen. of the s.w. provinces. His first great exploit was the capture of Acapulco, where a large body of regular troops was surprised and routed by a few hundred insurgents, mostly negroes. This victory was preceded and followed by many gallant and well-planned movements; but when in 1813 he determined on the attack of Valladolid, contrary to the advice of his next in command, Matamoros (q.v.), he undertook a task beyond his strength. There, after a fierce contest, his forces were routed, and after sustaining for some time an unequal struggle, he was captured, tried, and put to death.

MORESQUE. See Arabesque, Grotesque.

MORE'TO Y CABA'NA, Agustin, 1618–69; b. Spain. Little is known of his life. He wrote many plays, some religious, as *The Most Fortunate Brothers;* or heroic, like *The Brave Justiciary of Castile;* but the majority, "comedies of cloak and sword," in the old Spanish manner. His best drama, *Disdain met with Disdain*, is founded on Lope's *Miracles of Contempt*, and was in its turn imitated by Molière in the *Princesse d'Elide*. The Don Diego of his play of that name has become the Spanish type and synonym for a coxcomb.

MO'RETON BAY, on the e. coast of Queensland, Australia, is formed inside the islands of Moreton and Stradbroke, the former 25 m., and the latter 35 m. in length, and both about 5 m. in greatest breadth. It is 65 m. in length (lat. 27° to 27° 55′ s.) by 23 m. in greatest breadth. Its shores are rich in soil, and admirably adapted for agriculture. Its appearance is rendered picturesque and beautiful by the numerous islets, some of them capable of profitable cultivation, with which it is dotted over. Into this bay 5 navigable rivers, the Arrowsmith, Logan, Brisbane, Pine, and Caboolture, pour their waters. The entrance at the n. end is practicable at all times for vessels of the largest size; the entrance between Moreton and Stradbroke is narrow, and less safe.

MORETON-BAY CHESTNUT, *Castanospermum Australe*, a tree of the natural order *leguminosæ*, sub-order *papilionaceæ*, a native of Queensland, Australia. It attains a height of 70 to 100 ft., has wide-spreading branches, pinnate leaves, and large racemes of beautiful red and yellow flowers. The pods are 6 or 7 in. in length, and the seeds are in size and quality somewhat like chestnuts.

MOREY FORGERY, an event of the presidential campaign of 1880, when James A. Garfield, the republican candidate for president, was charged with having written a letter favoring Chinese immigration in the interest of a supply of cheap laborers. The letter, purporting to be addressed to "H. L. Morey, Lynn, Mass.," was made public in a New York paper, Oct. 20, 1880; and on the 22d what purported to be a fac-simile in lithograph or photo-engraving process from the original letter, was published in the same paper. On Oct. 23 Mr. Garfield, in two letters from Ohio, which were promptly made public, denounced the letter to Morey as "a bold forgery both in its language and sentiment;" and denied that he had ever heard of the existence of such a person as H. L. Morey. The managers of the democratic campaign refused credence to Mr. Garfield's denial, and circulated an immense number of copies of the original "letter;" producing a profound impression throughout the country, particularly on the Pacific coast. There is reason to believe that the "letter," now conceded to have been a forgery by some hand not yet known beyond question, turned the vote of California in favor of the democratic candidate for the presidency.

MORGAGNI, Giovanni Battista, 1682–1771; b. Italy; studied medicine at Bologna, and physics and comparative anatomy at Padua and Venice. In 1706 he published *Adversaria Anatomica*, a treatise of marked originality, and 6 years later he was appointed professor of the theory of physic at Padua. In 1719 he published complete his collection of *Epistolæ Anatomicæ*, containing his observations for many years. His great work, *De Sedibus et Causis Morborum per Anatomen Indagatis*, which appeared in 1761, is still an authority on pathology. Morgagni was a man of vast learning in other branches, and in medicine he performed much the same service for pathology that Haller did for physiology.

MORGAN, a co. in n. Alabama, s. of the Tennessee river; 686 sq.m.; pop. '90, 24,089, chiefly of American birth. The surface is irregular and mountainous. The soil in most portions is rich. Co. seat, Decatur.

MORGAN, a co. in n. eastern Col., formed from part of Weld; 1290 sq.m.; pop. '90, 1601. It is drained by the South Platte river. Co. seat, Fort Morgan.

MORGAN, a co. in n. central Georgia, drained by the Appalachee and Oconee rivers and their branches; 322 sq.m.; pop. '90, 16,041, inclu. colored; intersected by the

Georgia railroad. The surface is level or undulating, partly covered with forests and very fertile. Cotton, corn, and sweet potatoes are the staples. Limestone and granite are found; there are several saw-mills and tanneries. Co. seat, Madison.

MORGAN, a co. in w. Illinois, s.e. of the Illinois river; 580 sq. m.; pop. '90, 32,636, chiefly of American birth. It is mostly prairie, with occasional small tracts of timber. The soil is deep and rich, and produces immense quantities of corn, the annual production of which amounts to millions of bushels. Wheat and oats are also grown in abundance. There are large numbers of sheep, and wool-growing is cultivated with success. The chief manufacture is carriages; next in importance are agricultural tools, and machinery, flour, harnesses, and furniture. The Wabash, Chicago and Alton, Chicago, Peoria, and St. Louis, and the Jacksonville and St. Louis railroads pass through it. Co. seat, Jacksonville.

MORGAN, a co. in central Indiana; 430 sq. m.; pop. '90, 18,643, chiefly of American birth. The surface is level in the n., but more irregular in the south. The soil is rich, and produces immense quantities of Indian corn, besides wheat, oats, tobacco, and potatoes. There are large numbers of cattle, and wool is exported. The White river and Mill and White Lick creeks flow through it. There is a heavy growth of timber. The Cleveland, Cincinnati, Chicago, and St. Louis and the Pennsylvania railroads cross it. Co. seat, Martinsville.

MORGAN, a co. in n.e. Kentucky, having a range of the Allegheny mountains for its e. boundary, drained by the Licking river, forming a part of its n.w. border : 288 sq.m.; pop. '90, 11,249, chiefly of American birth, with colored. Its surface is rough and hilly, a large proportion covered with forests of beech, cedar, hemlock, laurel, holly, etc. Its mineral products are iron, bituminous coal, alum, and copperas, and oil springs appear in some sections. Its valleys are fertile, producing grain, potatoes, tobacco, wool, and dairy products. Some attention is paid to stock raising. Co. seat, West Liberty.

MORGAN, a co. in central Missouri ; 638 sq.m.; pop. '90, 12,311, chiefly of American birth. The surface is uneven and hilly, and the soil fertile. The chief products are Indian corn, wheat, and oats. Pork and cattle are also staples. Bituminous coal, lead, and limestone are found. The county is drained by the Osage and Lamine river. There are extensive forests of elm, wild cherry, oak, hickory, and ash. The Missouri Pacific railroad runs along the n. border. Co. seat, Versailles.

MORGAN, a co. in s.e. Ohio, on both sides of the Muskingum river ; 400 sq.m.; population '90, 19,143. The surface is uneven and diversified. The soil is fertile, and the principal crops are corn, wheat, tobacco, oats, and potatoes. The growing of wool is an important industry. There are extensive deposits of salt. There are a number of flour mills, tanneries, currying shops, salt manufactories, and carriage shops. Co. seat, McConnelsville.

MORGAN, a co. in n.e. Tennessee, watered by Emery and Obie's rivers ; 448 sq.m.; pop. '90, 7369. The surface is irregular. Co. seat, Wartburg.

MORGAN, a co. in n.e. Utah ; 725 sq.m.; pop. '90, 1780, chiefly of American birth. The surface is irregular and mountainous. The soil is not largely cultivated, but produces some barley and wheat. Gold is found in paying quantities, and coal and iron are known to exist. The Union Pacific railroad passes through it. Co. seat, Morgan.

MORGAN, a co. in n.e. W. Va., on the Baltimore and Ohio railroad and the Potomac river; 230 sq. m.; pop. '90, 6744. Large deposits of coal and iron are found within its boundaries. Co. seat, Berkeley Springs.

MORGAN CITY, formerly *Brashear*, a town in St. Mary's parish, La.; on the e. bank of Atchafalaya bayou, 80 m. w. of New Orleans, with which it is connected by the Southern Pacific railroad; and connects with Galveston, Tex., by a daily line of steamers. It is noted for its large shipments of fish and oysters. Pop. '90, 2291.

MORGAN, Charles W., 1790–1853 ; b. Va.; entered the navy at an early age, and was one of the officers of the ship *Constitution* at the time of the engagement with the men-of-war *Guerrière* and *Java* in 1812, when he rendered such conspicuous service that the legislature of Virginia, in recognition of it, presented to him a sword. From 1841 to 1843 he commanded the Mediterranean squadron. He was a nephew of Daniel Morgan, a brig.gen. in the revolutionary war.

MORGAN, Daniel, 1736–1802 ; b. N. J. When 17 years old he emigrated to Virginia, where he worked as a farmer for some years. Next, he shared in the perils of Braddock's expedition against the Indians, probably as a wagoner, and received a wound in his neck and face that greatly disfigured him. It is stated, also, that during this campaign he was unjustly punished by 500 lashes for some fancied indignity to an officer. At the breaking out of the revolution he was given the command of 75 men enlisted in his neighborhood, with whom he rode to Boston, a distance of 600 m., to join the main army, where he was detached in the expedition against Quebec. In the attack on that city he distinguished himself by bravery and courage, but he was finally taken prisoner. After being exchanged he was appointed col. of a Virginia regiment, and further promotion rapidly followed. In 1780 he received a brig.gen.'s commission ; was attached to the army in the south ; and won the memorable victory at Cowpens over Tarleton, for

which congress awarded him a gold medal. Shortly afterwards ill-health obliged him to retire to his farm, and he did not become conspicuous again until the "whisky insurrection" in Pennsylvania in 1794, when he commanded the Virginia militia against it. After this he was a member of congress from Virginia one term. Died at Winchester, Va.

MORGAN, Edwin Dennison, b. Mass., 1811. He received a common school education, and when about 17 entered a business firm at Hartford, Conn., and in 1831 became a partner. In 1836 he started a wholesale business in the city of New York, and soon acquired a large fortune. He served as a state senator 1849–53; was afterwards chairman of the republican committee, and in 1859 was elected governor of New York and served two terms, 1859–63. His administration was marked by the introduction of several local reforms, the reduction of the state debt, and improved management of the canals; he also displayed great vigor in assisting the general government at the outbreak of the civil war, and was given the rank of maj.gen. of volunteers. At the end of his term of office he was elected U. S. senator. In 1864 President Lincoln offered him the position of secretary of the treasury, but the honor was declined. He gave large sums to the building fund of Union theological seminary of New York. He d. 1883.

MORGAN, George Washington, b. Penn., 1820; after serving in the Texan war for independence in 1836, he entered West Point, but left without graduating, and took up the study of law. On the outbreak of the Mexican war, he raised a regiment of Ohio volunteers, attached to the command of gen. Taylor. In 1847 he was made col. in the regular army, and served under Gen. Scott in command of the 15th U. S. infantry. For gallantry at Contreras and Churubusco, he was brevetted brig.gen. He was appointed U. S. consul at Marseilles in 1855, and minister to Portugal in 1858. In the war of the secession, he commanded divisions in the army of the Ohio and the army of the Tennessee, but resigned, on account of ill health, in 1863. He was a member of congress from Ohio from 1871 to 1875. He d. in 1893.

MORGAN, Sir Henry John, about 1635–90; Welsh descent; trained to the sea and for some time served under Mansfield, at whose death he assumed command of a fleet of twelve ships, and as an English buccaneer preyed on the commerce of the West Indies. He carried Portobello by assault, in 1669 retired to Jamaica with a large fortune, but in 1670 again took command of a large fleet and ravaged the coast of Nicaragua. The next year he marched upon the city of Panama, and with less than 1500 men captured and burned the city. Peace having been made, he visited England, was knighted by Charles II., and appointed governor of Jamaica, where he died.

MORGAN, James Dady, b. Mass., 1810; in boyhood shipped in the *Beverley*, and barely escaped with his life, as the crew mutinied and the ship was burned. The boat in which he escaped reached the South American coast, and Morgan endured many privations and hardships in returning home. He served as captain in the Mexican war; when the civil war broke out was commissioned lieut.-col. of the 7th Illinois volunteers, distinguished himself at New Madrid and Corinth, and in 1862 was made a brig.-gen., and served in the Tennessee campaign, afterwards commanding a division of the 14th corps in Sherman's march to the sea. He died in 1896.

MORGAN, John Hunt, 1826–64; b. Ala.; settled near Lexington, Ky., in 1830. He was engaged in the war with Mexico, holding a commission of 1st lieut. in Marshall's cavalry, and was present at the battle of Buena Vista. He was afterwards in business in Lexington, manufacturing bagging, but in 1861 attached himself to Buckner's army, being in command of the Lexington rifles, which he afterwards left, and commanded a squadron of cavalry at the battle of Shiloh. He however, left the regular confederate service and engaged in guerilla warfare on his own account, with a band of adventurers, who made the name of "Morgan's raiders" remembered with terror wherever they appeared. The extraordinary celerity and success of his movements gave him a high and peculiar military reputation, seriously modified by the utterly irregular character of his modes of warfare. Following close after the union armies, he destroyed military stores, burned railroad trains, tore up tracks, demolished bridges, and generally harassed and despoiled the enemy after a fashion of his own. He was even sufficiently enterprising and ingenious to keep a telegraph-operator with him in his movements, by whose aid he was enabled to spread false intelligence concerning them, and also obtain constant information with regard to the attempts which were being made to interfere with his rapid operations. He was finally captured, with nearly his whole command, while making a bold raid through Kentucky, Indiana, and Ohio. He was imprisoned in the Ohio penitentiary, but succeeded in escaping, and fled into Tennessee, where he soon after organized another raid, which proved to be his last. He was betrayed, and captured by federal cavalry at a farm-house, where he was stopping, in Greenville, Tenn., and killed while seeking to escape.

MORGAN, John Pierpont, financier, was born in Conn. in 1837; the son of J. S. Morgan, and was educated at Boston and at Göttingen, Germany. He became a member of the firm of Dabney, Morgan & Co. in 1864, and in 1871 organized that of Drexel, Morgan & Co. which has been well known in railroad financiering.

MORGAN, John Tyler, b. Athens, Tenn., 1824; removed in youth to Ala., and was admitted to the bar, 1845; was a delegate to the state convention which passed the ordinance of secession. He entered the confederate army as a private and rose to the rank of brig.-gen. After the war he resumed practice in Selma, Ala.; was elected as a democrat to the U. S. senate, 1876, 1882, 1888, and 1894; was an arbitrator on the part of the United States before the Bering Sea tribunal, 1893; and became chairman of the senate committee on foreign relations the same year.

MORGAN, Junius Spenser (1813–1890); American financier. After some years in the dry-goods business he became, in 1854, partner in the English firm of Geo. Peabody & Co. He was a munificent church member and donated largely to Trinity college.

MORGAN, Lady (Sydney), b. about 1780; was the daughter of a theatrical manager, named Owenson, who settled in Dublin. Her father fell into pecuniary difficulties, and the clever, bold, and lively young woman resolved to support the fortunes of the family, first as governess, and then as author. She wrote *The Wild Irish Girl* in 1806. Sydney Owenson obtained a footing in the household of the marquis of Abercorn, in whose establishment her future husband, Dr. Morgan, held the post of private physician. The lord lieutenant was persuaded to make a knight of Dr. Morgan, and the newly wedded pair set up for themselves in Dublin. Here she wrote *O'Donnel* (1814). The opening of the continent in 1814 attracted the Morgans to Paris. Lady Morgan obtained admission into the highest society, corresponded with several celebrities, and wrote a work on *France*, which was eagerly received and vehemently praised and censured by critics of different political opinions. In 1818 the Morgans went to Italy—the wife to sketch manners, scenery, and society, while sir Charles was to contribute chapters on politics, science and education. Lady Morgan was received with great hospitality by the Italian nobility and the foreign visitors at Rome. Her *Italy* appeared in 1821, and proved one of the most successful and remunerative of her works. In 1824 the Morgans came to London, and in 1825 Lady Morgan began to keep a diary, which contains some amusing bits of literary, fashionable, and political gossip. Her reputation as an authoress became obscured, but she continued to the end of her career to assume the twofold character of the lady of fashion and the woman of genius. She succeeded in obtaining from the Whig government a pension of £300 a year, in acknowledgment of her literary merits, and partly, also, in recognition of the unjust and virulent attacks to which she had been subjected for having, in her earlier works, exposed the wrongs of her native country. She d. in 1859.

MORGAN, Lewis Henry, b. N. Y., 1818; educated at Union college, and admitted to the bar. He began the practice of law at Rochester, in 1844, and retired in 1864. He was one of the first authorities on ethnology and anthropology. In 1851 appeared his *League of the Iroquois*, a study of the customs and institutions of the six nations. His investigations were particularly directed to the systems of family relationship prevailing among savage tribes; and in pursuit of his inquiries, he addressed letters to missionaries and U. S. consuls residing in the vicinity of barbarous nations. By this means he collected a large body of information, which is contained in his *Systems of Consanguinity and Affinity of the Human Family*, which was published by the Smithsonian Institution in 1870. Some of the theories advanced in this work have met with considerable opposition from students of anthropology; as, for instance, from Mr. McLennan in his well-known book on *Primitive Marriage*. But the value of Mr. Morgan's researches as to facts has been universally recognized. In 1868 he published a work on *The American Beaver*, containing the results of his personal observations near lake Superior. Mr. Morgan was a member of both branches of the N. Y. legislature. He d. 1881.

MORGAN, Sir Thomas Charles, 1783–1843, b. England; educated at Eton and Cambridge. He took a medical degree in 1809, and began the practice of his profession in London. He was knighted in 1811, and soon afterwards established himself in Ireland, where, after giving up his practice, he devoted himself to literature and to the promotion of Roman Catholic emancipation. He published *Sketches of the Philosophy of Life; The Philosophy of Morals;* and with lady Morgan, *The Book Without a Name.*

MORGAN, William. See Anti-Masons.

MORGAN, William Ferdinand, s.t.d., b. in 1818 at Hartford, Conn.; graduated at Union college, N. Y., and at the Episcopal theological seminary in New York. For more than twenty-five years he was the rector of St. Thomas's church in New York, holding high place among the clergy of his denomination as a writer and preacher. A collection of his sermons has been published. He d. in 1888.

MORGANAT'IC MARRIAGE (Goth. *morgjan*, to curtail, limit), sometimes called *left-handed marriage*, a lower sort of matrimonial union, which, as a civil engagement, is completely binding, but fails to confer on the wife the title or fortune of her husband, and on the children the full status of legitimacy or right of succession. The members of the German princely houses have for centuries been in the practice of entering into marriages of this kind with their inferiors in rank. Out of this usage has gradually sprung a code of matrimonial law, by which the union of princes with persons of lower rank, in other than morganatic form, involves serious consequences, especially towards the lady. The penality of death was actually enforced in the case of the beautiful and unfortunate Agnes Bernauer (q.v.). In the 16th and 17th centuries, a fashion began among German princes of taking a morganatic wife in addition to one who enjoyed the complete matrimonial status—Landgrave Philip of Hesse setting the example, with a very qualified dis-

approbation on the part of the leading Reformers. An energetic attempt was made in the first half of the last c. by Anton Ulrich, duke of Saxe-Meiningen, to upset the established practice, and obtain for his morganatic wife the rank of duchess, and for her children the right of succession. In deference to the united opposition of the whole princedom of Germany, the emperor refused the duke's suit, declaring that there could be no marriage in princely families without "ebenbürtigkeit," or equality of birth. In the present c. morganatic marriages are by no means on the decline among the German reigning houses—one of the best known and most remarkable instances being the union of the late Archduke John, the "reichsverweser" of 1848, with the daughter of the postmaster of Aussee, in Styria, afterwards created countess of Meran. Morganatic marriages are recognized not only among the princely families, but among the higher aristocracy of the empire; and in Prussia even the "niedere adel," or inferior gentry, may contract unions of this kind. A sort of left-handed or "hand-fasted" marriage was recognized in early times in the Highlands of Scotland, and Ireland: the hand-fasted bride could be put away, and a fresh union formed, with the full status of matrimony. Unlike the case of German morganatic marriages, the issue were often accounted legitimate, even to the prejudice of the children of the more regular union that followed. The Royal Marriage Act, 12 Geo. III. c. 11, reduces to a position somewhat like that of morganatic unions every marriage in the royal family of Great Britain not previously approved by the sovereign under the great seal, provided the prince entering into it is under 25, and every such marriage of a prince above 25 which is disapproved by parliament.

MORGARTEN, a mountain slope on the boundary of the cantons of Schwyz and Zug, Switzerland, has acquired a world-wide celebrity as the scene of a great victory won by the Swiss forest cantons over the Austrians, Nov. 13, 1315. The Swiss, who had command both of the narrow pass which wound between Morgarten Hill and the lake, and of the adjoining heights, numbered only 1300 men, while the Austrians amounted to 15,000, and were led by duke Leopold, brother of the German emperor. When the Austrian troops had fairly entered the pass, those of the Swiss posted on the rocks above hurled down great masses of stone, which threw the enemy's cavalry into confusion, besides killing immense numbers of them. Their comrades who held the pass, taking advantage of the disorder, now charged the Austrians repeatedly, and utterly routed them. Only a few escaped, among whom was duke Leopold himself.

MORGENSTERN, Christian, 1805–67 ; b. Germany ; studied painting in the school of Bendisen. He afterwards studied at the Copenhagen academy of fine arts, and in 1830 took up his residence in Munich, where his first exhibited picture was "The Heath of Lüneburg." He exhibited a picture on the same subject at Paris many years afterwards. He was a good landscape painter, and also an etcher of merit. His best pictures are studies from the scenery of Heligoland.

MORGHEN, Raphael Sanzio Cavaliere, a famous engraver, was b. at Florence, June 19, 1758. His first instructor in the art of engraving was his father, who, according to some, was a German or the son of a German. The indications of talent that he gave were such as to induce his father to place him under Volpato at Rome. His progress then became very marked. Raphael's celebrated figures in the Vatican of "Poetry" and "Theology" were engraved by him in 1781; and he afterwards produced a succession of engravings of a very high class from many of the masterpieces of art: amongst these may be enumerated his prints from Raphael's "Madonna della Seggiola;" the "Madonna del Sacco," by Andrea del Sarto; the "Transfiguration," by Raphael; the "Duke of Moncado," by Vandyke; and by his burin, Da Vinci's "Last Supper," notwithstanding its decay, has been rendered with such consummate skill, as to lessen the regret felt for the evanescent condition of the original work. He accepted an invitation from the grand duke to reside at Florence, with a pension of 400 scudi, and a free residence, under condition of keeping a public school; and received marked attentions from the emperor Napoleon, to whom he dedicated his engraving from the "Transfiguration." Morghen died at Florence on April 8, 1833. He had married a daughter of Volpato's in 1781. His life, with a portrait, and a catalogue of his works, was published by his pupil Niccolo Palmarino. From this work it appears that he has engraved 73 portraits, 47 religious and 44 historical and mythological pieces, 24 views and landscapes, and 13 vignettes, crests, etc.—201 in all. The works of Morghen will always hold a very prominent place in the history of engraving. About the middle of last century, Strange had added a new feature to the art, by introducing, in a remarkable way, what is technically called by engravers "color," or the art of producing by management and variety of line a texture or quality that compensates to some extent for the want of the actual colors in a picture. This influenced the style of Volpato, Cunego, and other Italian engravers of the period, who imitated, though with no very great success, the brilliancy produced by Strange. Morghen, however, went far beyond these Italian engravers, for in his works he united much that was good in the engravings of Strange with a more correct and a purer style of drawing, and thus brought out in a very high degree all the important qualities for which those masterpieces he so skillfully rendered are distinguished.

MORGUE, a French word, denoting the inner wicket of a prison, at which persons accused or condemned are kept for some time, in order that the jailers and turnkeys may examine them at their leisure, so as to be able to recognize them when occasion requires. Hence the application of the word to a certain building (*La Morgue*) in the "city" (*La Cité*) of Paris, situated on the *Quai du Marché neuf*, where the dead bodies of persons unknown, found either in the river (Seine) or in the streets, are exposed to public view for three days. The corpses are put under a glass case, on a sloping slab of black marble. They are wholly naked, except across the middle, which is covered with a piece of leather. The clothes are hung on the wall above. When a corpse is recognized it is handed over to the relatives or friends of the deceased, on payment of costs and dues—otherwise it is interred at the expense of the city. The number of bodies yearly exposed in the *Morgue* is about 300, of which five-sixths are those of males. Morgues have been established in the principal American cities; in New York in 1866, in Boston in 1851, in Brooklyn in 1870, in Chicago in 1872, in St. Louis in 1874.

MORIAH, Mount. See Jerusalem.

MORIAH, a town in Essex co., N. Y., including Port Henry vill. Pop. '90, 6787.

MORI, the family name of the daimios or feudal princes of the provinces of Suwo and Nagato (or Choshiu) in Japan. During the 15th and 16th centuries, the Mori family ruled 11 provinces, but after being humbled by Taiko they held in fief only the provinces of Suwo and Nagato; and as such, were guardians of the straits of Shimonose'ki (see Shimonoseki). Nagato was long the seat of Dutch learning, and many students were sent to Europe and America, though under the ban of the Yedo authorities. The Mori family and their retainers were very active in the revolution of 1868, and took the field against the Tycoon, armed with American rifles. Among the many able men from this province were Kido, Hirosawa, Inouye, and other high officials and statesmen. The Mori crest is a transverse bar under which are three balls.

MORI, Arinori, a Japanese statesman, b. in Satsuma about 1848. He was one of the first natives to escape from Japan and the repressive measures of the tycoon. Reaching England, he spent two years in study, and returning to Japan took a seat in the national legislature, proposing the abolition of the ancient custom of wearing two swords. This measure, though at first angrily condemned, was finally adopted. Mori was the first Japanese ever chosen to fill a permanent diplomatic post abroad. This was at Washington, D. C., as *chargé d'affaires*, in 1871. While here he composed a work on *Life and Resources in America*, which was translated and circulated in Japan. He also collected in a pamphlet the views of leading American educators on the subject of education for Japan, and petitioned his government in an able memorial on behalf of liberty in religious matters. Recalled in 1873, he was soon after sent as minister plenipotentiary to Peking, and assisted to secure the Japanese treaty with Corea, Feb. 27, 1876. In 1879 he was appointed minister plenipotentiary to the court of Great Britain, a post which he long held. In 1874 he married a Japanese lady of Shidzuoka, according to the western principle of equality of goods and legal status—an innovation of great social influence. He was assassinated in 1889 by a fanatic.

MORIER, James, 1780–1849; b. England; traveled extensively in the east, and described his journey in his *Travels through Persia, Armenia, and Asia Minor*. He afterwards resided for six years in Persia, as private secretary to the British minister, and became familiar with the character and customs of the inhabitants—a knowledge which he soon made use of in novels of eastern life. The first and most popular of these, *The Adventures of Hajji Babá*, appeared in 1824. It was followed by *Zohrab*, and *Ayesha, the Maid of Kars*.

MÖR'IKE, Eduard, b. Würtemberg, 1804; educated at the Stuttgart gymnasium, and Tübingen, where he studied for the ministry. He was for a time settled over a church, but was compelled to leave the ministry on account of ill-health, and became a teacher in Stuttgart. Mörike published a number of novels and poems, and translations of Theocritus and Anacreon. His *Poems* appeared in 1838; *An Idyll of Lake Constance*, in 1846; and *Four Tales*, in 1857. He d. 1875.

MORILLO, Pablo, 1777–1838; b. Spain; count of Cartagena and marquis of Fuentes; entered the Spanish navy in 1793. During the war carried on by the Spaniards against Napoleon he raised a guerrilla corps, at the head of which he soon acquired reputation and became a lieut.gen. In 1815 he was placed in command of 12,000 men and sent to South America to conquer the insurgent provinces of Venezuela and New Granada; but after many alternations of fortune his army was routed and he was recalled. He then joined the court party and was believed to be one of the authors of an insurrection of the guards in July, 1822. After this he went over to the patriots, obtained command of an army corps, changed back again and submitted to the French intervention. His former treason, however, was not pardoned by the restored king, and he died in exile in France.

MORIN, Arthur Jules, b. Paris, 1795; educated in the Polytechnic School, and in 1839 made professor of industrial mechanics in the *Conservatoire des Arts et Métiers* of Paris. In 1843 he became member of the Academy of Sciences; in 1850 was appointed

to aid in organizing an agricultural institute for France; in 1851 commissioner to the exposition of London; the following year director of the *Conservatoire*, which place he retained till 1873; in 1855 was president of the executive committee of the Paris exposition, and in 1862 president of the Society of Civil Engineers. Prof. M. occupied the unique position of receiving all the military grades up to gen. of division without leaving the duties of his directorship of the conservatory of arts and trades. He was the inventor of a dynamometer-crank by which the force of living motors is measured and the laws of momentum of falling bodies determined. His scientific publications alone form a library, beginning with 1831 and ending with 1871, and have been a fertile source of information to scientists and machinists of all nations. He d. 1880.

MO'RION, an iron or steel head-piece worn by a man-at-arms in the days when armor was used. It was distinguished from the helmets of the knights and esquires in having neither visor nor beaver. Under the Norman laws every yeoman between certain ages was bound to keep his morion ready for service.

MORISON, John Hopkins, b. N. H., 1808; studied at Phillips Exeter academy, and graduated at Harvard college in 1835; was settled over the Unitarian society in New Bedford, Mass., and from 1846 till 1875 in Milton. He published *Life of Jeremiah Smith; Disquisition and Notes on the Gospel of Matthew.* He was one of the editors of the *Unitarian Review*, had been editor of the *Monthly Religious Magazine;* and was a frequent contributor to the *Christian Examiner* and other Unitarian journals. He received the degree of D.D. from Harvard college, published several books, and was regarded as an evangelical Unitarian. He d. in 1896.

MORISON, Robert, M.D., b. 1620, one of the most eminent botanists of the 17th c., was a native of Aberdeen, and having borne arms as a royalist in the civil wars, retired to France about 1650, and became superintendent of the garden formed at Blois by Gaston, duke of Orleans. After the restoration he was appointed by Charles II. one of his physicians, and "botanist royal," and became professor of botany at Oxford. He died in 1683. His great work is *Plantarum Historia Universalis Oxoniensis* (2 vols., 1676–99). He also wrote on umbelliferous plants.

MORISO'NIANISM, a name freely used to designate the distinctive tenets of the evangelical union (q. v.), but never accepted by that religious body. The system of doctrine so designated is fully enunciated in an authoritative document entitled *Doctrinal Declaration*, which was issued by the evangelical union conference of 1858—not as a fixed creed, but as a testimony to their distinctive faith.

MORLAIX, a seaport of France, in the department of Finistère, 35 m. e.n.e. of Brest. It has a considerable trade with England. Pop. '91, 14,855.

MORLAKS, the name of a maritime people occupying the coast of Dalmatia on the Adriatic, and a part of Austria-Hungary. They are of the Slavic race, but are a distinct people, mostly seafaring, and are drawn upon to man the Austrian navy. The territory occupied by them is called Morlacca, and the strait which separates it from the islands of Pago, Arbe, and Veglia, is known as the strait of Morlacca.

MORLAND, George, English artist, born in London 26 June, 1763. He inherited talent from his father, Henry Morland (1712–97), painter, engraver and picture-dealer, who gave him a good training. At sixteen he exhibited at the Royal Academy, and at seventeen he escaped from the severe discipline of his father's house, and dashed into a career of dissipation and prodigality unequalled in biography, supporting himself by the sale of his pictures, painted with marvelous rapidity and cleverness. He lived with a picture-dealer, and became the companion of ostlers, pot-boys, horse-jockeys, pawnbrokers, and pugilists, swaggering among them in his green coat with huge yellow buttons, leather breeches, and top-boots—the extreme picture of a handsome fop. In 1786 he married the sister of the engraver William Ward, and for a time reformed. At this period he painted many moralities in the style of Hogarth; but he soon returned to his profligate life, and painted his masterpiece, "The Inside of a Stable," now in the National Gallery, London, exhibited in 1791, the period of his best work. He became popular, and dealers flocked to him with a purse in one hand, a bottle in the other. Sometimes he painted two pictures a day, and once a large landscape with six figures in six hours. Every demand for money, tavern-score, or bill was paid by a picture worth twice the charge. Many tavern-signs painted to pay for his reckoning now fetch fancy prices. His subjects were scenes in humble life in town and country, cottages, stables, inn-yards, pastoral scenes, and domestic animals, especially pigs. Altogether he painted 4000 pictures. He died in a sponging-house in Holborn, 27 Oct., 1804. His epitaph on himself was: "Here lies a drunken dog." He was generous, good-natured, and industrious despite his faults, and he never degraded his art. After a period of neglect he is now ranked among the best masters of genre and animals, not far below the Dutch artists on whom he modelled his style. His auto-portrait is in the National Gallery, London. See Life, by George Dawe (1807); by J. Hassel (1804), and *Memoirs of a Picture*, by William Collins (1805).

MORLEY, Henry, b. England, 1822; educated in Germany and at King's college, London; after which he taught a successful school near Liverpool. In 1847 he published some papers in respect to the public health, which attracted the attention of Charles

Dickens, and led to an engagement as assistant editor of *Household Words*, a position that he retained six years. Then he became one of the editors of the London *Examiner* and a lecturer at King's college. During these years he also published *The Dream of the Lily Bell*, tales and poems; *Sunrise in Italy*, poems; *A Defense of Ignorance;* lives of Bernard Palissy, Gerome Cardan, and Henry Cornelius Agrippa; and a collection of his contributions to *Household Words*, under the title of *Gossip and Memoirs of Bartholomew Fair*. Since 1865 he has been professor of English literature in University college, London. His later works include *English Writers before Chaucer*, 2 vols., 1864–67; *A First Sketch of English Literature*, 1873; *English Literature in the Reign of Victoria*, 1881, etc. He died May 14, 1894.

MORLEY, John, b. England, 1838; graduated at Oxford in 1859, and during several years afterward edited a journal called the *Literary Gazette*, and contributed to *The Saturday Review*. In 1867 he published an historical study of Edmund Burke, which introduced him to the general public, and as editor of *The Fortnightly Review*, 1868–82, he became well known as a political and religious radical. He unsuccessfully contested the borough of Blackburn in 1869, and the city of Westminster, in 1880; but in 1883 was returned to parliament by the borough of Newcastle-upon-Tyne. In 1886 and 1892 he was chief secretary for Ireland. He has published *The Limits of the Historical Method; Critical Miscellanies;* elaborate critical studies of *Voltaire; Diderot; Rousseau; Burke; Emerson; Walpole;* a *Life of Richard Cobden*, etc.

MORLEY, Thomas, d. 1604; b. England; graduated at Oxford, and was appointed, after studying music with William Birde, a "gentleman of Queen Elizabeth's chapel," in 1592. He was familiar with the works of the Italian composers, and many of his compositions are madrigals and canzonets in the Italian manner. He also wrote a number of anthems. He edited a collection of madrigals by different English composers, one of whom was the father of John Milton, in honor of Elizabeth, who appears in it as Oriana. The title of this book is *The Triumphs of Oriana*. Morley was also the author of a work called *A Plaine and Easy Introduction to Practical Musicke.*

MORMONS, or, as they call themselves, The Church of Jesus Christ of Latter-Day Saints, are a religious sect founded by a native of the United States named Joseph Smith. Smith was the son of a farmer, and was born in the town of Sharon, Windsor co., Vt., Dec. 23, 1805. When he had reached the age of 10, his parents removed to Palmyra, in the state of New York, and four years later, to the town of Manchester, about 6 m. off. The reputation of the family is said to have been of the worst kind; we are told that they avoided honest labor, were intemperate, untruthful, and suspected of sheep-stealing and other offenses. These accusations are generally denied by Mormons, but Smith himself partly admitted them, affirming that he "had never done anything so bad as was reported of king David, the man according to God's own heart." Nevertheless, a rude sensual religiosity appears to have been mixed up with his more carnal conduct. There is the most satisfactory evidence—that of his enemies—to show that from an early period he was regarded as a visionary and a fanatic. This fact is of the utmost importance as affording a clew to his *real* character, and an explanation of that otherwise unaccountable tenacity of purpose and moral heroism displayed in the midst of fierce persecution. A *mere* impostor—i.e., a person who did not, in some sense or other, partly believe in his own mission, but who, on the contrary, felt that he was simply the liar and cheat that people called him—would have broken down under such a tempest of opposition and hate as Smith's preaching excited.

"When about fourteen years of age," Smith says, "I began to reflect upon the importance of being prepared for a future state." He then describes how he went from one religious denomination to another, but could find nothing satisfactory—nothing but "a great clash in religious sentiment." Then he began to withdraw into secret places to spend hours in prayer and meditation, and to receive angelic visits. The second of these happened on the evening of Sept. 21, 1823, when it seemed as though the house was filled with "consuming fire." In a moment a "personage" stood before him, "with a countenance like lightning," and "visible to the extremities of the body," who "proclaimed himself to be an angel of God." He informed Smith of various important particulars, as, "that his sins were forgiven, and his prayers heard; that the covenant which God made with ancient Israel was at hand to be fulfilled; that the preparatory work for the second coming of the Messiah was speedily to commence; that the time was at hand for the Gospel to be preached in its power and fullness to all the nations; and that Smith was chosen to be an instrument in the hands of God to bring about some of his purposes in this glorious dispensation." Besides all this, the angel gave him, by way of appendix, "a brief sketch of the origin, progress, civilization, laws, and governments" of the aboriginal inhabitants of America—"of their righteousness and iniquity; and the blessings of God being finally withdrawn from them." He was also informed where some plates were deposited, containing an abridgment of the records of the ancient prophets that had existed on the American continent. The angel appeared to Smith thrice that night, and afterwards paid him many visits. He told him where the records were deposited, "on the west side of a hill, not far from the top, about four miles from Palmyra, in the county of Ontario, and near the mail-road, which leads thence to the little town of Manchester." He advised him to go and view them, which Smith did; but the prophet was not yet holy enough to obtain possession of them.

At length, after due disciplinary probation, the angel of the Lord, on Sept. 22, 1827, placed in Smith's hands the wonderful records. They were engraven on plates nearly 8 in. long by 7 wide, a little thinner than ordinary tin, and bound together by three rings running through the whole. The volume was altogether about 6 in. in thickness, a part of which was sealed. The characters, letters, or hieroglyphics upon the unsealed part were small, and beautifully engraved. They represented an unknown language called the "Reformed Egyptian." Along with the records was found a curious instrument, called by Smith "urim and thummim," consisting of two transparent stones, set in the rim on a bow fastened to a breastplate. By means of these stone spectacles, God enabled him to understand and translate the ancient records into such humble English as the "prophet" (who had received almost no school-education, and could read with difficulty) was master of. The records contain the primitive history of America, from its first settlement by a colony that came from the tower of Babel, at the confusion of languages, to the beginning of the 5th c. of the Christian era. These primitive colonists were called Jaredites; they were a wicked and bloody race, and finally, like the Kilkenny cats, mutually destroyed each other, millions being slaughtered in the final conflicts. Silence again settled down upon America. But a new race came directly from Jerusalem about 600 B.C. These consisted of Lehi and his wife; his four sons, Laman, Lemuel, Sam, and Nephi, together with their four wives; two "sons of Ishmael," and their two wives; Zoram, a servant, and his wife; in all, 16 men and women. They are supposed to have landed on the coast of Chili. After the death of Lehi, quarrels broke out among the brothers. The Lord had appointed Nephi to be the ruler of the new race of colonists but his elder brothers would not hear of it; as a punishment for which, they and all their posterity were condemned to have dark skins, and "to become an idle people, full of mischief and subtlety, which did seek in the wilderness for beasts of prey." They are the ancestors of the American Indians, who are thus, according to Smith's records, simply *bad* Hebrews. The descendants both of Nephi and of his rebellious brothers, increased and multiplied, but were almost continually at war with each other. In the time of Nephi the second an awful earthquake announced the Crucifixion. Three days afterward Christ himself appeared out of heaven; showed the Nephites his wounded side and the print of the nails; instructed them for forty days in the truths of Christianity; healed the sick, blessed children, administered the sacrament, and planted churches, with apostles, prophets, pastors, teachers, and evangelists—the same order, the same priesthood, the same ordinances, gifts, powers, and blessings as were enjoyed on the eastern continent. Hostilities, however, between the Nephites and their dark-skinned brethren continued to rage as fiercely as ever; gradually the purity of their faith declined; and finally, in 384 A.D., a decisive conflict took place at the hill Cumorah, in western New York, where the Christian Nephites were nearly annihilated; miracles now ceased, and unbelief gradually became supreme. Shortly before this, however, a prophet called MORMON had been commissioned by God to write an abridgment of all their prophecies, histories, etc., and to hide it in the earth, till God should see fit to bring it forth, and "unite it with the Bible for the accomplishment of his purposes in the last days." This is the famous BOOK OF MORMON, believed by the followers of Smith (hence called MORMONS and MORMONITES) to be of equal authority with the Jewish and Christian Scriptures, and to form an indispensable supplement to them, containing God's revelations to the new, as the others to the old world. In 420 A.D. they were finally sealed up where Smith found them, by Moroni, one of the few survivors of the battle of Cumorah.

The way in which Smith translated was as follows: he sat behind a blanket hung across the room to keep the sacred records from profane eyes, and read off by the help of his "urim and thummim," to one Oliver Cowdery, who wrote down what the invisible "prophet" gave as a translation—Smith himself being, as he confesses, but a "poor writer." A farmer, of the name of Martin Harris, supplied Smith with the necessary funds to get the work printed. The *Book of Mormon* finally appeared before the world in 1830, with the names of Oliver Cowdery, Martin Harris, and David Whitmer appended to a statement that an angel of God had come down from heaven and shown them the original plates. This was immediately followed up by the testimony of eight other witnesses, among whom were Smith's own father and two brothers (suspected, however, it must not be forgotten, of being addicted to sheep-stealing and other nefarious practices), who affirmed that "Joseph Smith, junior," had shown them the mysterious plates. These, however, are the only persons who have been so privileged. No other human being has ever seen them. Like Macpherson's Ossianic MSS., they have never been forthcoming, however loudly demanded, and of late years all knowledge of them has become traditional.

Attention was soon drawn to the newly published work, and a controversy sprung up regarding its real authorship. Evidence was brought forward by the opponents of Smith to show that, with the exception of certain illiterate and ungrammatical interpolations, bearing on religious matters, the so called *Book of Mormon* was really borrowed or stolen nearly *verbatim* from a MS. romance written by a quondam clergyman, named Solomon Spalding, who died in 1816. It is unnecessary to go over the arguments *pro* and *con*. Suffice it to say, that *anti*-Mormons generally think them conclusive; while the "saints" consider the whole story of Spalding's MS. romance a scandalous fabrica-

tion. About 1829 Smith became acquainted with one Sidney Rigdon, originally a compositor and preacher, but who by this time had begun to promulgate a species of incipient Mormonism, and had managed to found a little sect of his own. It is conjectured by the opponents of Mormonism that Rigdon (into whose hands Spalding's romance is supposed to have fallen for some time) gave it to his new associate to further his purposes, and that the latter—in whose soul there may have been (according to our theory of his character) some rude and gross religious notions and feelings—devised the ungrammatical interpolations. This theory acquires some probability from the fact that these religious passages do not refer to old-world faiths and the practices of an ancient ritual, but to quite modern questions, such, we are told, as were rife in the villages of western New York about 1830. Calvinism, Universalism, Methodism, Millenarianism, Roman Catholicism, are discussed, if not in name, yet in reality. Infant baptism is condemned; so, strange to say, are polygamy and freemasonry.

Undeterred, nevertheless, by exposure, ridicule, and hostility, Smith and his associates persevered in preaching their "doctrine," which was a new Americanized phase of millenarianism. They declared that the millennium was close at hand, that the Indians were soon to be converted, and that the New Jerusalem—the final gathering-place of the saints—was to be somewhere in the heart of the American continent. The "prophet's" house "was frequently beset by mobs and evil-designing persons; several times he was shot at, and very narrowly escaped;" but his fearless courage continued to bring him disciples; and on April 6, 1830, the *Church of Jesus Christ of Latter-day Saints* was first organized in the town of Manchester, N. Y. Smith was fiercely attacked by the leaders and preachers of the other religious denominations, but he kept his ground stubbornly, argued pretty well, and when argument failed, had recourse to a style of zealous prophetic asseveration, which is generally irresistible with weak and ignorant people. If the orthodox preachers, however, could not baffle him in speech, they knew how to inflame their hearers with the most ferocious animosity against the new sect; and in Jan., 1831, Smith and his followers considered it prudent to remove to a distant part of the country. They established themselves at Kirtland, in Ohio, which was to be the seat of the New Jerusalem. They now made immense progress. Their missionaries were full of zeal (none more so, however, than Smith himself), converts were made in great numbers, and churches were established in the states of Ohio, Pennsylvania, New York, Indiana, Illinois, etc. Still the eyes of the new sect turned westward—to the region of the great prairies, where they might be allowed to work out their system in peace and freedom. In the autumn of 1831 a colony was established in Jackson co., Mo., which a "revelation" given to Smith assured the saints was "the land of promise and the place for the city of Zion." Land was largely bought; preaching was vigorously carried on, a printing-press was established, a monthly periodical, *The Morning and Evening Star*, and a weekly newspaper, *The Upper Missouri Advertiser*, were started to propagate the doctrines of the new sect; everywhere was visible a spirit of industry, sobriety, order, and cleanliness. It is only fair to the Mormons to state these things. Account for it how we may, they were, in many important respects, morally, socially, and industrially, far in advance of their neighbors. When Smith returned to Kirtland, he set up a mill, a store, and a bank, and continued his propagandist labors with great success, but not without savage persecution; thus, for example, on the night of Mar. 22, 1832, a mob of Methodists, Baptists, Campbellites, and other miscellaneous zealots, broke into the prophet's house, tore him from his wife's arms, hurried him into an adjoining meadow, and tarred and feathered him! Sidney Rigdon was similarly handled, and rendered temporarily insane. Smith, however, undaunted by this brutal treatment, preached next day with his "flesh all scarified and defaced," and proved the folly of persecution by baptizing three new converts in the afternoon. Meanwhile, the brethren in Missouri continued to prosper, but this very circumstance deepened the animosity towards them of all who were not Mormons. Whispers also began to be spread about their indulging in a community of wives. The rumor was not true, but it probably originated in Rigdon's theory of the "spiritual wife," which Smith at first denounced, but afterwards accepted, and thereafter commenced "sealing wives" to himself in some mysterious way that Gentiles cannot yet fathom. The first step towards polygamy—a doctrine not yet revealed, however (in fact, *contrary* to the "revealed" doctrine on the subject), materially helped to inflame the hostility of the impulsive and unscrupulous backwoodsmen. Secret societies (according to Smith, composed "of the basest of men") were formed to expel the Mormons from Missouri; their periodicals were stopped, their printing-press confiscated, their bishops tarred and feathered, and numberless other outrages were committed. Finally, the hapless "saints" were compelled to flee across the Missouri river, and men, women, and children had to encamp in the open wilderness on a winter-night in 1833. They subsequently settled in Clay co., in the same state, where they remained upwards of three years. In July, 1834, they were visited by the "prophet" himself, accompanied by 100 persons, mostly young men, and nearly all priests, deacons, teachers, and officers of the church. During a brief residence of one week among them, he accomplished much in the way of vigorous organization; next year, 1835, a further step was taken in the development of a hierarchy by the institution of a body of apostles—twelve in number—who were sent out to preach the new doctrines among the Gentiles. One of these twelve was the famous Brigham Young, who had become a convert about the close

of 1832, and had soon shown himself to be a man of wonderful sagacity and force of character. He was ordered down east among the Yankees, and made numerous converts even among this acute people. In 1837 Orson Hyde and Heber C. Kimball were dispatched as missionaries to England, where they received large accessions to their numbers, especially from the masses in the great manufacturing and commercial towns, Manchester, Liverpool, Leeds, Birmingham, Glasgow, and, above all, from the mining districts of South Wales, where Mormonism, in some places, almost competed for popularity with Methodism itself. Since then they have extended their strange evangelization to the East Indies, Australia, the islands of the Pacific, Egypt, Palestine, Turkey, and almost every country on the continent of Europe.

About the close of 1837 or the beginning of 1838, the bank at Kirtland stopped payment, and proceedings were taken against the prophet and others for swindling. Luckily, just at this moment, he received a "revelation" to depart into Missouri, which he instantly obeyed, with all the more alacrity that internal disorders had painfully manifested themselves in the new colony. These were at last healed; but the conflict between the saints and the other Missourians became fiercer, more envenomed, more sanguinary than ever, assuming, in fact, almost the proportions of a civil war. The prophet and Rigdon were thrown into prison, and finally, towards the close of 1838, the whole body of saints, about 15,000, quitted Missouri, and took refuge in Illinois. Here they obtained a grant of land in the vicinity of the little town of Commerce, a name which the Mormons, in obedience to a "revelation" given to Smith, changed to Nauvoo, or the city of beauty. The country was a mere wilderness when the Mormons settled in it: it soon began to rejoice and blossom as the rose. Lieut. Gunnison (a most intelligent and impartial writer) is forced by facts to be eloquent in praise of Mormon industry, and gives us a perfectly enchanting picture of the new colony. The legislature of Illinois granted a charter to Nauvoo; a body of Mormon militia was formed, under the name of the Nauvoo legion, of which the prophet was appointed commander; he was also appointed mayor of the city, and was thus supreme in all matters civil and military, as well as religious. But the doctrine of "sealing wives" once more roused the wrath of the neighborhood, and serious disturbances took place, the ultimate result of which was that the prophet and his brother Hyram were thrown into prison at Carthage. After a short time it began to be rumored that the governor of the state was desirous of letting the two Smiths escape, whereupon a band of "roughs," about 200 in number, broke into the jail, June 27, 1844, and shot them. Disastrous as this termination of his career was to Smith himself, there cannot be the shadow of a doubt that it was a most fortunate thing for the system which he founded. "The blood of the martyrs is the seed of the church." A halo of solemn and tender glory now encircles the memory of one who stood greatly in need of this spiritual transfiguration. It may here be stated that it cannot be shown that Smith was a polygamist, in our sense of the word. Years after his death, Brigham Young produced a paper which he said was a copy of a "revelation" made to Joseph at Nauvoo, commanding him to take as many wives as God should give him. But it was not till Aug. 29, 1852, at a public meeting held in the Salt Lake City, that the "revelation" was formally received.

Smith's death created great agitation and confusion among his followers. Sidney Rigdon and others aspired to succeed him, but the council of the twelve apostles unanimously elected Brigham Young, and events have shown the wisdom of their choice. The legislature of Illinois having revoked in 1845 the charter given to the city of Nauvoo, and the hostility of their neighbors not having in the least abated, the saints resolved to emigrate far beyond the boundaries of civilization, and to seek a new home amid the solitudes of the Rocky mountains, where they might pass their lives in unmolested peace. Explorers were sent out to examine the country, and brought back a favorable report of the Great Salt Lake valley. See Great Salt Lake, Salt Lake City, and Utah. In Feb., 1846, the first emigrants crossed the ice-bound Mississippi, settled for a year in Iowa, and then marched under the strictest discipline across the great wildernesses. Agricultural operations were commenced almost the instant they arrived at the shores of the Salt lake. The cheerfulness, intelligence, and zeal exhibited on all sides were truly admirable. The world has never seen swifter, more active, more glad-hearted colonists than these singular "saints." It would be unfair to shut our eyes to such facts. In judging Mormonism, we must keep them constantly in view, to prevent us from forming mere abstract and theoretical decisions, which will not in the least affect the future of Mormonism. Brigham Young arrived in the valley July 24, 1847, and the main body of the Mormons in the autumn of 1848. The Salt Lake City was soon founded, an emigration fund established, and settlers poured in from all parts of Europe and America; and perhaps a greater amount of physical comfort was enjoyed here than in any other part of the world. In 1850 the government of the United States admitted the region occupied by the Mormons into the union as a territory, under the name of Utah, and Brigham Young was appointed governor by President Fillmore. District judges were also appointed by the federal government, but these were looked upon with great suspicion and mistrust by the saints, who finally drove them out of the country in 1851. Brigham Young was now suspended from his office of governor, and Col. Steptoe of the U. S. army was appointed his successor. He arrived in Utah in 1854, but found it prudent after some time to withdraw from the country. During the next two years the collisions

between the U. S. officers and the saints became more and more frequent, and in the spring of 1856 the whole of the former were forced to flee from the territory. A new governor, Alfred Cumming, was appointed by the authorities at Washington in 1857 and also a new superintendent of Indian affairs; besides a force of 2,500 men was sent to enforce obedience to the laws of the United States. The saints attacked their supply trains, and compelled the enemy to winter at some distance from the Salt Lake. In the early part of next year negotiations were entered into between the contending parties; the Mormons submitted to the federal authority, and the federal troops were allowed to encamp on the western side of lake Utah, about 40 m. from Salt Lake City, where they remained till 1860, when they withdrew. After the close of the civil war, the United States seemed determined to insist on its authority. A federal governor was again appointed, and polygamy was declared in 1871 to be a criminal practice contrary to the laws of the United States; Brigham Young was even arrested. One of the most notable events in the recent history of the Mormons took place in the year of Brigham Young's death (1877). John D. Lee, a Mormon bishop, was brought to trial and executed for his share in a crime till then unmvestigated. In 1857 a party of Mormons and Indians, under Lee's command, assaulted a train of 150 non-Mormon emigrants at Mountain Meadows, near Utah, and massacred every soul of them. The complicity of the leaders of the church was not proved, but Lee had been clearly the immediate instigator of the deed. By the death of Brigham Young, which occurred Aug. 29, 1877, the office which he filled fell to John Taylor, an Englishman, though Young's actual position of leader of the Mormons descended to George Q. Cannon, entitled "first counselor" to the president, also an Englishman, a delegate in congress, the Mormon attorney at Washington, and one of the ablest and shrewdest men of the sect. John Taylor died in exile in 1887, and was succeeded by Wilford Woodruff.

Three years prior to the death of Brigham Young his nineteenth and last wife, Ann Eliza Webb, broke away from Mormonism, and traveled through the United States delivering lectures against the institution, and particularly its polygamous feature. These lectures produced no small impression. Congress continued to take cognizance of the condition of Utah and the institution of Mormonism. In 1873 Mr. Frelinghuysen introduced a bill which severely censured the practice of polygamy among the Mormons, and declared that their wives could claim relief by action for divorce. In 1874 the committee of the house of representatives having the matter in charge reported a bill which was still more sweeping in its character, being destructive of all local authority in Utah, and, in fact, placing the territory in the condition of a province, in its relation to the U. S. government. By this bill the control of affairs in Utah was placed in the hands of federal officials, and its practical application would have been to root out the foundation of the system on which Mormonism depended for its existence. During the same year the case of a contest of the election of George Q. Cannon, as delegate from Utah, came up in the house of representatives, and was decided in his favor. But this decision was accompanied by the passage, by a vote of 127 to 51, of a resolution appointing a committee of investigation into the polygamous relation sustained by delegate Cannon, who, it was alleged, was united by the marriage tie of the Mormon church to four wives. Still later, in 1874, what was known as the "Utah judiciary bill," passed the house by a vote of 159 to 25, in the face of a resolute and eloquent defense of Mormon institutions by delegate Cannon. This bill was supposed to comprise "a definite and serious attack at the very foundation of Mormonism."

In 1879 the secretary of state of the United States addressed a circular to the U. S. ministers abroad directing them to invite the attention of the governments to which they were severally accredited, to the laws of the United States against polygamy. This circular also instructed the ministers to inform these governments as to whatever facts might be in their possession, or which they could obtain from consular agents or otherwise, as to the emigration of Mormons from the different countries; and to request the several governments to enforce existing laws against proselytism and the organization of emigration by the Mormon agents and missionaries. Certain of these governments replied to the diplomatic agents of the United States as to these requests, that it was deemed inexpedient and inconvenient to inquire concerning the religion or place of destination of persons leaving their shores. The circular from the secretaryof state also expressed the determination of the government of the United States to enforce the law against polygamy contained in section 5352 of the *Revised Statutes* (the constitutionality of which had been recently sustained by a decision of the supreme court), and to eradicate the institution of Mormonism.

In 1882 an act was passed by congress, known as the Edmunds bill, which, in the main was directed to the exclusion of polygamists from office and from the polls; and a commission was appointed to carry out its provisions. The immediate effect of this bill was to disfranchise 12,000 polygamous Mormons in Utah. But because polygamy was not at once extinguished, and because the elections that followed were carried by Mormons, monogamists in practice, but polygamists in belief, so that the new legislature was as much in favor of the doctrine as the old, hasty criticism asserted that the bill would proved as futile as previous legislation against polygamy. But by those well informed in Utah affairs, it was not expected that the disfranchisement would have immediate effect. In a report made by the Utah commissioners to congress, 1883, they

expressed great confidence in the final effect of the bill upon polygamy, saying among other things: "The very existence of the law disfranchising the polygamists must tend to destroy their influence, whenever it is understood that this is to be a permanent discrimination. Those Mormons who have the ballot will after a time be conscious of a power which they will be unwilling to use forever at the bidding of those who have it not. The fact also that it will be necessary to the preservation of the political influence of the People's party (as the Mormons style themselves) to have a large body of their members who are not polygamists, must tend in time to weaken the practice of polygamy, for every unmarried Mormon who takes but one wife additional loses three votes for his party—his own and those of his two wives (woman suffrage being established by law in Utah). Another consideration—his influence upon young men and the rising generation—is entitled to great weight. Seeing all the offices of honor, trust, and profit, such as delegate to congress, probate judges, sheriffs, etc., held by monogamists, while polygamists are wholly excluded, the aspiring young men of the territory would present an anomaly in human nature if they should fail to be strongly influenced against going into a relation which thus subjects them to political ostracism and fixes on them the stigma of moral turpitude." This report placed in a strong light the final effect of disfranchisement; but there were clauses in the law whose effects upon polygamy were prompt and immediate; such, for instance, as the clause which excluded from juries all persons who had practised polygamy, or all who believed that it was right for a man to have more than one wife; and the clause which provided that if any one man in the territory lived with more than one woman in the marital relation he should be deemed guilty of a misdemeanor. Formerly there was enough law in Utah for the suppression of polygamy, but it was impossible to enforce it, because polygamists or their sympathizers sat upon juries; and testimony needed to establish polygamous marriage was suppressed. But under the present law some of the leading Mormons have been convicted, among them George Q. Cannon, the Mormon delegate to congress. The Anti-Mormon bill of 1887 annulled all territorial acts establishing the religious corporation known as the Church of Jesus Christ of the Latter Day Saints, and the corporation known as the Perpetual Fund Emigration Company, and obliged all voters, officers, and jurors to take an oath to support the constitution and laws of the U. S.

In July of that year a constitutional convention was held at Salt Lake City, and a constitution was adopted by its members, all Mormons, prohibiting polygamy and unlawful cohabitation, but Congress refused to admit the Territory. On May 19, 1890, the United States Supreme Court decided, on appeal, a case brought to test the constitutionality of the Edmunds Act, its verdict (three judges dissenting) being that this act was within the powers of Congress, and that the proceedings already instituted had been properly taken. In Sept., 1890, President Woodruff declared both by a proclamation and in conference that the church accepted the United States law prohibiting polygamy. In 1889, Ogden, and in 1890, Salt Lake City, the elections were carried by "Gentiles."

Hierarchical Organization.—The following is a summary of the main features of the organization: First, there is a president, and he has two counselors. Second, there are twelve apostles. The president is one of them, and each receives a salary of $1500 per annum; the president, moreover, exercising an authority equal to that of the other eleven. Third, there are seven presidents designated as the presidents of the seventies, each body consisting of seventy elders, there being eighty of these seventies in Utah, each seventy having seven presidents, and each seven one president. The seventies make annual reports, and all of these officials mentioned constitute the general authorities of the church. Next comes the head patriarch of the church, the dignity being hereditary when the candidate is worthy, the incumbent residing in Salt Lake City, and being endowed with the power to bless the people by laying on of hands. There is next a presiding bishop who attends to the collection of tithes—the collection from this source being $1,000,000 annually. "Zion" is divided into 23 stakes, each of which has a president, and is divided again into wards, and each ward into districts: the district has a quorum of teachers, whose business it is to visit each family periodically, and look after the spiritual welfare of the members. Each district has a meeting-house, Sunday-school, day-school, young men's mutual improvement society, primary association for small children, and usually a dramatic society. At Cedar City there is a co-operative store, a tannery, and a grist-mill. The church organization ends with the priests and deacons. There is a Sunday-school organization known as the Deseret Sunday-school union. There are temples at St. George, Logan, Manti, and Salt Lake City.

Doctrine.—The saints are almost incredibly materialistic in their doctrines. Their godhead is formed on Buddhistic principles. While professing to believe in the trinity, they explain that God was once a man, who has, however, so advanced in intelligence and power that he may now be called (comparatively speaking) perfect, infinite, etc., but that he has still the form and figure of a man; he has even "legs," as is evident (says Mr. Pratt, "the leading scholar of the Mormon church") from his appearance to Abraham, though he has this advantage over his creatures, that "he can move up or down through the air without using them." Christ is the offspring of the "material" union, on the plains of Palestine, of God and the Virgin Mary—the latter being duly married after betrothal by the angel Gabriel. Yet he is believed to have had a previous existence,

to have even made the universe out of "unformed chaotic matter as old as God," and his worship is enjoined as Lord of all. The Paraclete is vaguely described, but is also material. It would appear, however, that there is an older trinity, that of "Elohim, Jehovah, and Michael, which is Adam." Adam, again, is declared to be the "god" of Jesus Christ; Jesus Christ, the god of Joseph Smith; and Joseph Smith is now the god of this generation: but the whole affair is a mass of unintelligible rubbish. The human intellect probably never sank into more abysmal nonsense; all that can be definitely set before the mind is that Mormons believe that by faith, obedience, holiness, any man may rise into a deity, and acquire the power of making, peopling, and ruling a "world" forever! The *second* article of the Mormon creed affirms that "men will be punished for their own sins, and *not* for Adam's transgressions;" the *third* article states that "through the atonement of Christ, all mankind may be saved by obedience to the laws and ordinances of the Gospel." The *fourth* article affirms these "ordinances" to be: 1. Faith in the Lord Jesus; 2. Repentance; 3. Baptism; 4. Imposition of hands by the gift of the Holy Spirit; 5. The Lord's Supper, administered kneeling. The saints, who are much averse to strong drinks, use water instead of wine in the sacrament, which is taken every week. The *fifth* article declares that "men must be called to the work of God by inspiration;" the *sixth*, that the same organization must now exist that existed in the primitive church; the *seventh*, that miraculous gifts—"discerning of spirits, prophecy, revelations, visions, healing, tongues," etc.—have not ceased. The "discerning of spirits" led Smith, or rather his friends Rigdon, Pratt, etc., who are understood to be the real authors of the metaphysics, into a variety of curious speculations. They believe that the soul of man was not created, but "coexisted equal with God." The *eighth* article is decidedly liberal; it expresses a belief that the word of God is recorded not only in the Bible and the book of Mormon, but in "all other good books." As for the contradictions that exist in the first, they are admitted, but it is alleged that they are "corruptions," and that they can be removed by any prophet's inspired explanations. On the other hand, the statement that the saints pretend to have a new and inspired translation of the Bible was denied by Brigham Young in a conversation with Dixon (*New America*, vol. i. pp. 216–217). The *ninth* article expresses a belief in all that God has revealed, is revealing, or will yet reveal. The *tenth* affirms the literal gathering of Israel, the restoration of the ten tribes (the "American Indians," who are, in consequence, treated with considerable humanity by the saints; the negro, on the other hand, being excluded from the Mormon church, as a descendant of Cain), the establishment of the new Zion on the western continent—the millennial reign of Christ on earth, and the transformation of earth into a paradise. The *eleventh* article maintains "the literal resurrection of the body." The *twelfth* article asserts the absolute liberty of private judgment in matters of religion; the *thirteenth* declares it the duty of the saints and all others to be "subject to the powers that be," whether monarchical or republican. The *fourteenth* and last is worthy of being universally accepted: "We believe in being honest, true, chaste, temperate, benevolent, virtuous, and upright; and in doing good to all men;" also that "an idle or lazy person cannot be a Christian, neither have salvation."

An "apostate," excommunicated in 1869, testified in court that the Endowment House ritual was not written, but that at the ceremony neophytes took the following oath: "You, each and all of you, agree to avenge the blood of the prophets, Joseph and Hiram, who have sealed their testimony with their blood, and that you will teach this to your children and children's children to the third and fourth generation. This you do in the presence of God and his ministering angels."

Of the 207,000 people in Utah, about 166,000 are Mormons. But this sect or nation does not alone hold sway in Utah. It has also the balance of power in Idaho and Arizona, and is rapidly populating Washington, Montana, Wyoming, and Colorado. The vote of Idaho, for congressman, at the election of 1880, is alleged to have been carried by an order from George Q. Cannon, directing that all the Mormons in that territory should vote for a certain man whom he named: all the Mormons in Idaho voted accordingly, as a unit. The Mormons are agriculturists, and wherever they go occupy the arable lands for their farms, and the hill-sides for pasturage for their stock. The mines are given up to the Gentiles, who become the patrons of the Mormons for their supplies. Already the Mormons have endeavored to place such a tax on the proceeds of mining in Utah as should render the business unprofitable, and thus remove the only temptation for Gentile settlement. The nature of the people by whom the Mormon territory is being constantly populated by immigration is of a kind to fall readily under the influence of astute leaders: an influence which is assisted by the ignorance and poverty of the immigrants These immigrants, assisted in leaving a land where they have been forced to live in abject destitution, or by the most arduous labor for the mere necessaries of life, find themselves transported to a country rich in vegetables, meat, fruit, and fish; where, among a people industrious, comfortable, and apparently happy, they are easily imbued with the principles under which these conditions have seemingly been wrought out. The result is subordination to the commands of their leaders; and a confiding belief in the merits of the church and the sect, which is sufficient to render them instruments in the hands of the president and his subordinates.

As to the possible future of the institution of Mormonism it is proper to quote the following statement of a bishop, setting forth the hopes and designs of the Mormons themselves: "Like a grain of mustard was the truth planted in Zion, and it is destined to

spread through all the world. Our church has been organized only fifty years, and yet behold its wealth and power. We look forward with perfect confidence to the day when we will hold the reins of the U. S. government. That is our present temporal aim, after that we expect to control the continent." When the newspaper correspondent, to whom this was said, remarked that such a scheme seemed somewhat visionary, considering the fact that Utah cannot secure recognition as a state, the bishop's reply was: "Do not be deceived: we are looking after that. We do not care for these territorial officials sent out to govern us. They are nobodies here. We do not recognize them. Neither do we fear any practical interference by congress. We intend to have Utah recognized as a state. To-day we hold the balance of power in Idaho, we rule Utah absolutely, and in a very short time we will hold the balance of power in Arizona and Wyoming. Our vote is solid, and will always remain so. It will be thrown where the most good will be accomplished for the church. Then, in some great political crisis, the two present political parties will bid for our support. Utah will then be admitted as a polygamous state, and the other territories we have peacefully subjugated will be admitted also. We will then hold the balance of power, and will dictate to the country. In time our principles, which are of sacred origin, will spread throughout the United States. We possess the ability to turn the political scale in any particular community we desire. Our people are obedient. When they are called by the church they promptly obey. They sell their houses, lands, and stock, and remove to any part of the country the church may direct them to. You can imagine the results which wisdom may bring about, with the assistance of a church organization such as ours. It is the completest one the world has ever seen. We have another advantage. We are now and shall always be in favor of woman suffrage. The women of Utah vote, and they never desert the colors of the church in a political contest. They vote for the tried friends of the church."

There is a large body of Mormons under the leadership of Joseph Smith, eldest son of the "prophet," who repudiate polygamy, and denounce Brigham Young as a promulgator of false doctrines. This sect styles itself the "Reorganized Church of Jesus Christ of the Latter Day Saints," and holds that the legitimate successor to Joseph Smith was his eldest son; that the allegation that Smith introduced polygamy on the strength of Divine revelation was an invention of Brigham Young; that the Utah church had departed from the faith; and that the Reorganized church is the true successor to the original church, and as such is legally entitled to all that church's property and rights. This legal right was recognized by the U. S. court of Ohio, 1883, which awarded to them a temple in Kirtland, consecrated in 1836, and over the right to the possession of which there had been a long litigation between the Reformed and Utah churches. The headquarters of the Reformed church are at Lamoni, Iowa, and it numbers altogether about 27,000 members. It sends missionaries to, and circulates tracts in Utah, where it has maintained a mission since 1863. The Utah church numbers about 144,000 members in the territory, and altogether in America and Europe about 200,000.

There are 3000 in New Zealand, and 3142 in Great Britain. Since the passage of the Edmunds Act thousands of Mormons have emigrated to Mexico.

About 1800 are yearly added to the church in the United States by emigration, chiefly from Scandinavian countries. The total number of foreign adherents received between 1881 and 1889 was 16,094. About 26 Mormon periodicals are published.

See *Book of Mormon* (1830); *Book of Doctrine and Covenants*, consisting of select "revelations" given to Smith (1832); *The Pearl of Great Price*, also by Smith (first published, Liverpool, 1851); *Journal of Discourses*, by Brigham Young and others (1854 *et seq.*); *The Exploration and Survey of the Great Salt Lake*, by Capt. Stansbury (1849); *The Mormons, or Latter-day Saints*, by Lieut. Gunnison of the U. S. topographical engineers (1852); *The Mormons*, by Col. T. L. Kane (1850); *Voyage au Pays des Mormons*, par Jules Remy (1860); *The City of the Saints*, by R. F. Burton (1861); Dixon's *New America* (1867); and Busch, *Geschichte der Mormonen* (Leipsic, 1870); Mrs. Stenhouse, *An Englishwoman in Utah* (1880); Kennedy, *Early Days of Mormonism* (1888); Bancroft, *History of Utah* (1889).

MORMYRIDÆ, a family of malacopterous fishes, allied to the *esocidæ*, or pike family; having longish compressed bodies, and a slender tail, swelling out at the origin of the caudal fin. The skin of the head is naked, enveloping the gill-covers and gill-rays, leaving only a slit for gill-opening. The mouth is small. All the known species inhabit the rivers of Africa. The SHARPED-NOSED MORMYRUS (*Mormyrus oxyrhynchus*) is regarded as one of the best fishes of the Nile. It is caught by lines baited with worms. The mormyridæ are nocturnal fishes. They are sometimes represented on Egyptian monuments, and seem to have been held sacred by the ancient Egyptians.

MORNAY, PHILIPPE DE, Seigneur du Plessis-Marly, 1549–1623; illustrious as a writer and actor during the most direful period of religious intolerance in France. He was son of a Roman Catholic father who destined him for the church, and of a Protestant mother whose opinions he imbibed; becoming according to Voltaire "the most virtuous, and greatest of men." Thoroughly educated in school, and by much travel in youth in Italy and Germany, we find him at the age of 22 at Cologne engaged in theological discussions and writings to inspire the low countries to defy the Spanish power. His address to Coligny, then minister of France, designed to secure that minister's influence for William of Orange, was a marvel of literary power. The minister had already

resolved to send Mornay as confidential representative to that prince when the massacre of St. Bartholemew's took place and the young writer barely escaped from Paris with his life. He fled to England, and immediately sought the influence of Elizabeth to avert the further destruction of Protestants in France. He took part with La Noné in an unsuccessful movement of the Huguenots at St. Germain; married an accomplished Protestant lady in 1576, and immediately after joined the army of Condé in France, from which he was called to become a member of the council of Henry of Navarre. By him he was sent to England on a mission; was intercepted by the Spaniards who, ignorant of his mission, permitted him to escape; and finally succeeded in procuring from Elizabeth 80,000 écus for Condé's army. He remained some years in England occupied in strengthening the Protestant cause at the English court, by his writings, and by material aid. In 1584–88 he was member of the two royal political councils of Montauban and La Rochelle, and remained chief counselor of Henry III. until his assassination. He then served Henry IV., and was by him made councilor of state and engaged in delicate negotiations. When the king abjured Protestantism Mornay broke with him, and published an essay on the institution of the eucharist, in which he shows the mass to be condemned by the New Testament and the fathers of the church. It brought upon his head a storm of invective from all sides, but the answers published only served to cause the more universal reading of the heretical tract. Challenged by Du Perron bishop of Evreux, to maintain the truth of some of its statements in open discussion, he accepted, and was caught in a trap carefully prepared to show some of his statements false. This was May 4, 1600. Henry IV. was glad to be sustained in his treachery to old Protestant friends by the apparent defeat of their ablest champion, and Mornay was retired from public life until 1617, when he appeared in an assembly of notables at Rouen, and again in 1620 in efforts to bring conciliation between insurgent Huguenots and the government of Louis XIII., and soon after retired to his chateâu to die. By the Catholics he was called the pope of the Huguenots. In controversial writings he was prolific, scholarly, and brilliant.

MORNING GLORY. See Convolvulus.

MORNY, Charles Auguste Louis Joseph, Duc de, a noted French statesman, of the second empire, regarding whose parentage the biographical dictionaries published under imperial censorship are strangely silent. It is, however, universally believed that he was the son of Queen Hortense and of the Comte de Flahault, and consequently half-brother of Louis Napoleon. He was born in Paris, Oct. 20, 1811. The Comte de Morny, a French nobleman resident in Mauritius, received 800,000 francs to adopt him as his son; but he was educated by his "grandmother," Madame de Flahault; and Queen Hortense left him at her death, in 1837, an annuity of 40,000 francs. Morny entered the army in 1832 as a sub-lieut. and is said to have shown at this early period a predilection for metaphysics and theology, which is indeed sufficiently surprising, if true, considering his subsequent thirst for material gratifications. He served with some distinction in Algeria; but he soon abandoned a military life, and in 1838 made his début in the world of industry as a manufacturer of beet-root sugar, and published a pamphlet on the subject. Ever after that time, he was mixed up in all sorts of commercial and financial speculations—railway companies, canal companies, French and foreign mining companies, credit societies, industrial enterprises, etc. Chosen a deputy in 1842, he quickly attained a prominent position on account of his aptitude for dealing with financial questions; but events showed that he was not free from the reckless spirit of an adventurer, and his daring at times excited a suspicion of enormous swindling somewhere. After the revolution of 1848, he became attached to the cause of his half-brother, and was the leader of the subtle and treasonable policy of the Elysée. He took a prominent part in the *coup d'état.* His rôle was to exhibit *sang-froid,* and to throw the republican leaders off their guard. Nor did he fail of success. He passed the evening of Dec. 1 at the *Opéra Comique,* and yet, by six o'clock next morning the deed was done, and Morny was minister of the Interior. In 1854 he became president of the *Corps Législatif,* and was ambassador to Russia during 1856–57, where he married the rich and handsome Princess Trubetskoi. The result of his Russian mission was the establishment of intimate political relations between the two governments, and a commercial treaty advantageous to both countries. He died March, 1865.

MOROCCO, or Marocco, called by the natives *Maghrib-el-Aksa,* "the extreme west," or briefly *Maghrib,* an empire or sultanate in the n.w. of Africa, is bounded on the e. by Algeria, on the n. and w. by the Mediterranean sea and Atlantic ocean, and on the s. by the desert of Sahara. It lies between 27° and 36° n. lat. and 1° and 13° e. long. Its area is about 219,000 sq. miles, with a population variously estimated at from 2,500,000 to 12,000,000. An estimate in 1889 placed it at 9,400,000. The country is generally mountainous, the Atlas (q. v.) range traversing it in several parallel chains from s.w. to n.e., and sending out numerous spurs to both the coast-country and the desert. There are, however, many level tracts throughout Morocco, especially at its western and eastern extremities, and on the borders of the desert. The central range of the Atlas forms the water-shed separating the streams which flow into the Atlantic and Mediterranean from those which run southward to the desert. The former rivers have the shorter course and less volume, but they are perennial; while the latter become dry in summer, and even when running are lost in the sands of the Sahara. The chief rivers are the Muluya, with its tributary the Sharef, which drains the n.e. of the country, and falls into the Mediterranean after a course of 400 m.; the Kos, Oom-a-beg,

Bu-Regreb, Tensift, Suse, and Assaker, the last forming for part of its course the southern boundary of Morocco, drain the central and western districts, and fall into the Atlantic; the Draha, Fileli, Ziz, and Gir irrigate the dry plains of Tafilelet, and the first-mentioned then empties itself into the Atlantic ocean. The subsequent courses of the other three rivers are not yet well ascertained.

The *climate* between the central range of Atlas and the sea is temperate, the thermometer seldom falling lower than 40° F., or rising above 90° F., owing partly to the regulating influence of the sea breeze, and the shelter afforded by the mountains from the scorching winds of the desert; but in the s.e. districts, extremes of heat and cold are said to prevail, and rain is there unknown.

Among the chief grain crops of the country are wheat, barley, maize, durra, etc.; and among fruits, figs, dates, pomegranates, oranges, and lemons are common. Beans, peas, almonds, coriander seeds, canary seeds, etc., are also produced in considerable quantities. Morocco is supposed to be rich in mineral treasures, but mining has not been developed, owing to the government prohibition. In the neighborhood of Atlas, however, considerable quantities of iron are mined. Copper occurs in several places as well as gold, antimony, silver, lead, rock salt, coal, gypsum, pottery clay and marble. M. was formerly infested with wild animals, but the larger and more savage species are now no longer common. There are still, however, numerous wild hogs. In the s. part antelopes and ostriches abound. The breeding of sheep, oxen, goats, camels, mules and asses forms an important item of industry. There is an abundance of fish in the streams as well as in the sea. The locusts are numerous and the crops are often injured by their depredations.

The inhabitants, like those of Barbary in general, consist of Moors, Berbers, Arabs, negroes, and Jews, and various intermixtures between these races. The estimate above mentioned divides the population according to race as follows: Shellah Berbers, 2,200,000; Berbers and Tuaregs, 3,000,000; Arabs, 3,700,000; and Jews, 150,000. Of the Arabs it was estimated that about 700,000 were pure nomads. The negroes are for the most part slaves. The Jews are the descendants of immigrants from France, England, and Holland between the 13th and 15th centuries. Very few Europeans reside in Morocco, and they are confined to the coast. An estimate places the number of Christians at 5,000, of whom about 4,000 were centered at Tangier. With the exception of the Christians and Jews, the inhabitants are all Mohammedan. The state of civilization is low and a large part of the nomadic population is in a condition of virtual savagery.

Besides the divisions of Fez and Morocco, which were formerly kingdoms, the country contains the three territories of Tafilelet, Suse, and Draa. For purposes of administration, the empire is subdivided into 44 governments or districts, 35 in the n. and 9 in the region s. of Atlas; but some of the tribes are ruled by their own chiefs and are merely in name under the authority of the sultan. The government is purely despotic, the sultan having power of life and death over all his subjects. There is no written code of laws, the sole repository of legal rules being the Koran. The highest judicial officer is the Cadi-el-Djemma, appointed by the sultan. This officer in turn appoints the cadis of the provinces. Judicial procedure is often disgraced by extortion or perverted by caprice. The testimony of a Christian or a Jew against a Mohammedan is never admitted. The sovereign of M. called by the Europeans the Emperor of Morocco, is known among his subjects as sultan, and assumes the title of *emir-ul-mumenin*, or "prince of the believers." The title is hereditary in the male line, but does not necessarily descend to the eldest son. Education is backward, and conversion to Christianity proceeds very slowly. Some attempts at missionary work have been made, and in 1896 an American missionary was permitted to establish a mission at Mequinez. Up to that time the interior of Morocco was an unknown land to the American missionaries.

The industries of M. have remained stationary for several centuries, although their products show a considerable degree of taste and skill. The principal industries are the production of leather goods, and silk, the weaving of wool, and the making of carpets, embroidery, earthenware, and arms, all of which articles are prized in Europe. In the production of leather articles the Moors have attained remarkable skill, having long known the art of rendering any kind of leather extremely soft and white, and of imparting to it brilliant colors. There is an important caravan trade between Morocco and the Sudan and also with Mecca and the Levant. With Europe commerce is confined to the eight ports on the coast, namely, Mogador, Tangier, Casablanca, Masagan, Rabat, Saffi, Araish and Tetuan. The principal exports are wool, cattle, hides, grain, beans, leather, almonds, wax, feathers, olive-oil, lentils, etc. The principal imports are cotton and cotton goods, sugar, tea, iron and iron ware, porcelain and glass ware, wine, spirits, petroleum, tobacco, etc. The trade is principally with Great Britain, France, Spain and Germany. According to the figures of 1895, Great Britain had fully one-half the trade. The staple articles of import are cotton goods, most of which come from Great Britain. In recent years there has been a marked increase of the trade with Germany. Statistics of 1895 showed a balance of trade against M., the imports being over $8,000,000 and the exports over $6,000,000. In that year the United States did not figure in the commercial returns; but efforts have since been made to promote the trade of the latter country with M. and to secure more direct steamship communication between the two countries.

The army consists of a disciplined force know as *Askar*, numbering about 10,000 infantry and 4,000 cavalry; and a body of about 20,000 militia, cavalry and infantry. By the aid of Spanish, Italian, and British officers, the discipline of the army has been improved and several important military works have been carried out. Besides the forces above mentioned, there is an irregular body of cavalry and infantry amounting to about 40,000.

The history of Morocco is, generally speaking, similar to that of the rest of Barbary (q. v.) down to the end of the 15th century. About that time, it was formed into a monarchy, and, notwithstanding internal divisions, enjoyed considerable prosperity, and the confines of the empire were extended as far south as Timbuctoo. This empire fell to pieces, and was succeeded in 1546 by that of the sherifs of Tafilelet, who conquered both Morocco proper and Fez, and united the whole country under one government. This is the present ruling dynasty. In the middle of the 17th c. the empire of Morocco embraced part of the present province of Algeria, and extended south as far as Guinea, where it came into collision with the Portuguese settlements. Since the commencement of the 19th c. the rebellions of the wild mountain tribes, the disturbances in Algeria, and difficulties with foreign states, caused by the aggressions of the Riff pirates, have greatly retarded the well-conceived measures of the various rulers for the development of the resources and increase in civilization of Morocco. In 1814 the slavery of Christians was abolished; and in 1817 piracy was prohibited throughout Morocco. In 1844 Morocco took part in the war of Abd-el-Kader against the French, in the course of which Tangier was bombarded and Mogadore occupied; but peace was concluded in the same year. In 1851 and 1856 complications took place with France concerning some French vessels which had been plundered by the Riff pirates, but in each case compensation was given by the sultan. In 1859 the Spanish government, smarting under a series of similar outrages, demanded compensation, and also an apology for an insult to the Spanish flag at Ceuta; and on the sultan's disclaiming all responsibility for these acts, war was declared by Spain, Oct. 22, 1859, and a large force under Marshal O'Donnell invaded Morocco. Two battles were fought, several ports were bombarded, and Tetuan taken, and on Mar. 25, 1860, the sultan yielded. A treaty was accordingly signed, April 27, 1860, by which the sultan ceded some portions of his territory, paid 20,000,000 piastres towards the expense of the war, and granted several commercial privileges to Spanish merchants. Since that time, the history of Morocco has been externally uneventful; but the steady weakening of the Sultan's power has made future complications with foreign states not unlikely. Spain, France, Italy, and England would all be glad to acquire a foothold in the country, and each views the other with jealous eyes. Local revolts in 1892 nearly led to the intervention of these powers in the affairs of Morocco, but mutual distrust still keeps them in check. Muley-Hassan died in 1894 and was succeeded by his son Muley-Abd-el-Aziz (b. 1881).

MOROCCO (Arab. *Marakash*), one of the two capitals of the empire of the same name, is situated in the s.w. of the country, four miles s. of the river Tensift, and at the n. end of an extensive and fertile plain. It is surrounded by a strong lime-and-earth wall thirty feet high. The town is ill built, the streets narrow, irregular, and unpaved; the houses, generally built of the same materials as the wall, are one story high, with flat roofs, and narrow openings instead of windows. A large portion of the space within the walls is occupied with gardens, open areas, and market-places. In the bazar and market-place a large miscellaneous trade is carried on. Morocco possesses about twenty mosques, of which the Kutubia is remarkable for size and elegance. There are several tanning and leather-dyeing establishments, some of them of great extent. Est. population (1893), 60,000.

Morocco was founded in 1062, and reached the summit of its prosperity in the 13th c., when it contained more than 700,000 inhabitants, since which time it has been rapidly decaying.

MOROCCO LEATHER. See LEATHER.

MORON', a town of Spain, in the province of Seville, and thirty-five m. s.e. of the city of that name, on the Guadeira. It is built on irregular acclivities, and contains the remains of a once almost impregnable castle erected by the Moors on Roman foundations. The inhabitants are engaged in the culture and preparation of olive oil. Pop. commune, 16,100.

MORPETH, a market-town and parliamentary and municipal borough of England, in Northumberland, is situated on the Wansbeck, fifteen miles north of Newcastle. Of the principal buildings, the parish church dates from the 14th c.; the free grammar school of Edward VI., founded in 1552, has an income from endowment of £650 a year; the town-hall was erected by Sir John Vanbrugh. Flannel is manufactured; brewing, malting, and tanning are carried on, and iron-foundries and corn-mills are in operation. Pop. 1891, 42,500.

MORPHEUS (literally, the "shaper" or "fashioner"), in the classic mythology, the son of Somnus, (Sleep), because he shapes or moulds the dreams that visit the sleeper. He is first mentioned by Ovid, and is represented as an old man with wings, pouring somniferous vapor out of a horn.

MORPHIA, $C_{17}H_{19}NO_3 + H_2O$, derives its name from Morpheus, in allusion to its narcotic properties. It is the most important of the alkaloids existing in opium, of which it constitutes from one-eighth to one-sixteenth by weight. It occurs in combination with meconic, and sometimes with sulphuric acid. It is obtained in short rectangular prisms, containing one equivalent of water of crystallization, which is expelled at a gentle heat, when the morphia melts into a resinoid substance. Morphia is soluble in about 1000 parts of cold and in 400 of boiling water; boiling alcohol dissolves it freely, but it is insoluble in ether and chloroform. Its solutions have a bitter taste, and change the yellow color of turmeric paper to brown. Morphia is not so easily detected in cases of poisoning by opium as meconic acid (q.v.). The following are the ordinary tests for it: Concentrated nitric acid, when applied to a crystal either of morphia or of one of its salts, produces a blood-red color. A solution of morphia in strong sulphuric acid is colored red by a drop of nitric acid.

When it is mixed with iodic acid, iodine is liberated; which may be recognized by its brown color and by the well-known starch-test.

Morphia is the only opium-alkaloid which is soluble in lime-water, and this property affords one of the best means of extracting it. A watery infusion of opium is boiled with milk of lime, filtered, mixed with powdered sal-ammoniac, and again boiled. By this means the lime is converted into the hydrochlorate (or, more correctly, into chloride of calcium), the ammonia is volatilized by the heat, while the morphia is precipitated in a crude form, which admits of easy purification.

Morphia combines with acids to form crystallizable salts, which are readily soluble in water and in alcohol. Of these, the *hydrochlorate* (*muriate*) and the *acetate*, especially the former, are much used in medicine.

The therapeutic uses of morphia and its salts are very similar to those of opium (q.v.); but the preparations of morphia are preferable to opium and laudanum in being less liable to occasion nausea and headache. The ordinary dose of morphia, or its hydrochlorate or acetate, when given to an adult to allay pain or induce sleep, ranges from a quarter of a grain to half a grain. Hypodermic injection of M. is not unusual.

MORPHOLOGY. See METAMORPHOSIS OF ORGANS.

MORPHOLOGY, ANIMAL. See METAMORPHOSIS OF ANIMALS.

MORPHY, PAUL CHARLES, b. New Orleans, 1837; educated at St. Joseph's College. While still a boy he developed remarkable skill in the game of chess, and soon became enthusiastic concerning it, and devoted most of his time to this amusement, which was to him a serious study. He speedily became so proficient as to defeat with ease the players of his native city, and his remarkable skill began to attract general attention among chess-players throughout the country. In 1857 the first chess congress was organized in New York, and Morphy, being specially invited to attend, played daily at the rooms of the congress, which were crowded by persons interested in chess, who were astonished at his remarkable facility in this difficult game. He defeated with ease such players as Paulsen, Fiske, Marasche, Lichtenhein, Thompson, Meade, and others, the leading chess amateurs of the country; and in 1858 made his first public exhibition of those astounding *tours de force*, blindfold games, as to which he had but one equal competitor, Paulsen, who was, however, a far inferior player before the board. In the same year he visited London, where he played with Löwenthal, winning a majority of games. He attended, at Birmingham, the annual meeting of the British Chess Association, where he played eight games at once without the board, defeating his opponents in six of them. In Paris he played at the celebrated chess resort, the *café de la régence*, and defeated the great French players, Rivière, Laroche, Jowmand, and Devinck; beat Harwitz five games out of seven, losing one and drawing one; and out of eleven games played with Anderson, the German champion, beat seven and drew two. He remained abroad until the spring of 1859, exhibiting his remarkable powers with and without the board, and on his return to the United States, was admitted to the bar of New Orleans, where he continued to reside, practicing, however, but little. He greatly injured his health by the strain upon his mental faculties, occasioned chiefly by his blindfold playing, and was forced at last to give up chess altogether, and never quite recovered his mental condition. He d. at New Orleans, 1884.

MORRELL, WILLIAM, b. England; came to Massachusetts bay with Captain Robert Gorges, in 1623. He spent a year in the Plymouth colony, and on his return to England published a Latin and English poem, called *Nova Anglia*, suggested by his observations in America. It has been republished by the Massachusetts historical society. Little is known of his life, except that he was a clergyman.

MORRILL, DAVID LAWRENCE, LL.D., 1772–1849, b. N. H.; at first a physician, then a Congregational pastor at Goffstown. In 1807 he resumed the practice of medicine, from which he retired in 1830. He served for a number of terms in the New Hampshire legislature, of which he was chosen speaker in 1816 and in 1823 he was president of the state senate. In 1817 he was elected U. S. senator, and on the expiration of his term, was elected governor.

MORRILL, JUSTIN SMITH, b. Vt., 1810; a merchant and afterwards a farmer. He was a member of congress from Vermont, from 1855 to 1867. During much of this period he was chairman of the ways and means committee, and had an important part in the economical and financial legislation that came before congress. He is the author of the famous Morrill tariff of 1861, and a strong advocate of protection. He was elected U. S. senator in 1867, 1872, 1878, 1884, 1890, and 1896. He published *The Self-Consciousness of Noted Persons* (1886).

MORRILL, LOT MYRICK, b. Me., 1813; graduated at Waterville college (now Colby university); was admitted to the bar in 1839. In 1854 he was elected a member of the Maine legislature; two years later, president of the state senate, and in 1858–60, governor. From 1861–76 he was a U. S. senator, an office he resigned to accept the appointment of secretary of the treasury, June 21, 1876. After serving until the completion of President Grant's administration, he received the appointment of collector of customs at Portland, Me., which post he held until his death, 1883.

MORRIS, a co. in e. central Kansas; 684 sq.m.; pop. '90, 11,381, chiefly of American birth. The surface is level and generally fertile. Most of it is prairie, and in the w. portion there is little or no timber. It is watered by the Osage river, and numerous small tributaries of the Kansas river. Limestone is found in some parts. The principal productions are Indian corn, wheat, oats, potatoes, hay. Co. seat, Council Grove.

MORRIS, a co. in n. New Jersey, bounded on the n.e. by the Pequannock river, on the e. and s.e. by the Passaic river, and on the n.w. by the Musconetcong; 470 sq.m.; pop. '90, 54,101, chiefly of American birth. The surface is uneven and crossed by a number of ridges, of which one of the highest, Schooley's mountain, is a summer resort. Co. seat, Morristown.

MORRIS, a co. in n.e. Texas, s. of the Sulphur Fork of the Red river. The surface is diversified, and heavily timbered with oak, hickory, ash, and cypress. The soil is fertile, but not much cultivated. The county has lately been set off, and has not yet become thickly settled. Pop. '90, 6580. Area, 260 sq. m. Co. seat, Dangerfield.

MORRIS, city and co. seat of Grundy co., Ill., on the n. bank of the Illinois river, and the Illinois and Michigan canal, and on the Chicago, Rock Island and Pacific railroad; 62 miles s.w. of Chicago. It has a high school, newspapers, national banks, and churches. St. Angela's academy, for the higher instruction of women, is here, a Roman Catholic institution, established in 1857. The city is the center of a considerable trade in grain and cattle. There are mines of bituminous coal and flouring mills. Agricultural implements, hardware, leather, bricks, tile, and other clay products are made. Pop. '90, 3,653.

MORRIS, Benjamin Wistar, D.D., b. Wellsboro, Penn., 1819; graduated at the General theol. seminary, 1846; was ordained priest in the Prot. Epis. church, 1847; was rector of St. Matthew's church, Sunbury, and St. David's church, Manayunk; asst. minister at St. Luke's church, Germantown. He was consecrated miss. bp. of Oregon and Washington territory, 1868. His diocese now includes only Oregon.

MORRIS, Charles, 1784–1856; b. Conn.; entered the navy in 1799. He was attached to the American squadron in the war with Tripoli, and was made lieut. in 1807. In the war of 1812 he was first lieut. of the *Constitution*, and was dangerously wounded in the engagement between that frigate and the *Guerriere*, Aug. 19, 1812. Two years later, in command of the *Adams*, he cruised along the coast in search of British merchantmen. He was attacked on the Penobscot river by a superior British force, and was obliged to destroy his ship. He continued in the service for the rest of his life, holding various commands. He was successively chief of the bureau of construction, inspector of ordnance, and from 1851 till his death chief of the ordnance bureau.

MORRIS, Clara, b. Cleveland, O., about 1846; made her first appearance at the academy of music in her native city, 1862. She resided in Cleveland for several years. Her first important part was "Theresa," in the *Orphan of Geneva*, acted in Buffalo, N. Y., 1866. She married Mr. Harriott, 1876. She is greatly admired in portrayals of emotional parts.

MORRIS, Edward Joy, b. Philadelphia, 1815; educated at Harvard; elected to the Pennsylvania legislature in 1841. He was a member of congress, 1843–45; and again, 1857–61. He was *chargé d'affaires* at Naples, 1850–54, and minister to Turkey, 1861–70. Morris published a *Tour through Turkey, Greece, Egypt, and Arabia Petræa; The Turkish Empire;* and some translations. He d. 1881.

MORRIS, George Pope, 1802–64; b. Penn.; at an early age he became a journalist in New York city, where in 1823 he established *The Mirror*, a literary weekly that he continued to publish until 1842, when he united with N. P. Willis in publishing *The New Mirror* a year or more, and then *The Evening Mirror*. These publications were the representatives of the best literary, dramatic, and artistic interests of the day, having among their contributors Bryant, Halleck, Poe, Paulding, Leggett, Hoffman, and most of the well-known literary men of New York. In 1845 Mr. Morris originated another journal, *The National Press*, which eventually became *The Home Journal*. It is as a song-writer, however, that he is chiefly remembered; and among the songs which made his name familiar may be mentioned particularly: *Woodman, Spare that Tree, My Mother's Bible, We were Boys Together*, and *A Long Time Ago*. In 1853 he published *The Deserted Bride, and other Poems;* and also during the same year he edited, with Mr. Willis, *Prose and Poetry of Europe and America*. Another of his successes was a drama, *Brier Cliff*, which was played forty consecutive nights in one of the New York theaters.

MORRIS, George Sylvester, b. Vt., 1840; graduated at Dartmouth college, where he was afterwards tutor. After spending a number of years abroad, in the study of philosophy, he was appointed, in 1870, professor of modern languages and literature in the university of Michigan. He published a translation of Ueberweg's *History of Philosophy*, in 1871. His *British Thought and Thinkers* appeared in 1880; *Philosophy and Christianity*, 1883. He d. in 1889.

MORRIS, George Upham, 1830–75; b. Mass.; entered the navy in 1846, and was lieut. in command of the Cumberland when she was sunk by the Merrimac, Mar. 8, 1862, on which occasion his cool courage gained great praise. He was made a commander in 1866, and placed on the retired list in 1874. He d. 1875.

MORRIS, Gouverneur, 1752–1816; b. N. Y.; educated at Columbia, then known as King's college; studied law, and was admitted to practice in 1771. He was known as a writer of ability while still in his teens; and certain papers by him on finance were highly considered. In 1775 he was sent as a delegate to the provincial congress, and was one of the committee that drafted the constitution for the state of New York. In 1777 he was a member of the continental congress, and of the committee appointed by that body to investigate and report on the condition of Washington's army, then at Valley Forge. He was appointed by Robert Morris, in 1781, assistant superintendent of finance, and held the position for about three years, when he entered into mercantile business. He was sent by Pennsylvania as a delegate to the constitutional convention of 1787, and was appointed one of the committee of five appointed to draft the constitution. In 1791 he was sent by Washington to England on a diplomatic mission; and in the following year was named minister to France, where he remained until 1794, when the French government requested and obtained his recall. In 1800 he was elected to the U. S. senate by the legislature of the state of New York, to fill out an unexpired term. He retired from public life after he had completed the period for which he was elected. He is said to have been an eloquent speaker, and remarkably well informed.

MORRIS, Henry W., 1806–63, b. N. Y.; entered the navy in 1819, and was made capt. in 1856. He was attached to the African, Brazilian, and Mediterranean squadrons successively, and at the beginning of the civil war was in Washington superintending the construction of the *Pensacola*. He succeeded in running her by the confederate batteries on the Potomac early in 1862, and reached the federal blockading squadron in the gulf of Mexico. He distinguished himself in the attacks upon Forts Jackson and St. Philip at New Orleans, after the capture of which he took the command of the squadron stationed there.

MORRIS, John Gottlieb, D.D., LL.D., b. Penn., 1803; educated at Dickinson college and Princeton theological seminary. From 1826 to 1859 he was pastor of Lutheran churches in Baltimore. He catalogued the books in the Peabody institute at Baltimore, of which he was the first librarian, and prepared a list of lepidoptera found in the United States for the Smithsonian Institution. He edited the *Lutheran Observer* and other periodicals, and wrote a number of books: *Popular Exposition of the Gospels*; *The Life of Catharine de Bora*; and some translations from the German. He d. in 1895.

MORRIS, John Thomas, b. India, 1826; studied at Trinity college, Cambridge, where he became a Roman Catholic. He completed his education in the English college at Rome, and was ordained to the priesthood. After passing three years in the diocese of Northampton he returned to Rome, and became vice-rector of the English college. At the end of three years he went back to England, where he was appointed canon residentiary of the London chapter. He also acted as private secretary to Cardinal Wiseman, and his successor, Cardinal Manning. In 1867 he became a member of the Society of Jesus. He was for a time rector of a Jesuit college in Malta, and is now professor of canon law and church history in St. Bruno's college. He has published a *Life of St. Thomas of Canterbury*; *Condition of Catholics under James I.*; *The Troubles of our Catholic Forefathers*, 3 series; *The Letter-books of Sir Amias Poulet*; and *Cardinal Wiseman's Last Illness*.

MORRIS, Lewis, 1671–1746; b. N. Y.; son of an officer in the army of Oliver Cromwell, who in 1672 settled where Morrisania now is on a farm of 3000 acres. He ran away from home when a lad, and visited Virginia and the West Indies. Returning he studied law, and at the age of 21 was a judge of the superior court of New Jersey, a member of the council, and afterwards member of the assembly. He became chief-justice of New York and New Jersey; state councilor, 1710–38; acting governor, 1731: and governor of New Jersey in 1738, retaining the office until his death.

MORRIS, Lewis, 1726–98; b. N. Y.; educated at Yale college, where he graduated in 1746. He farmed the family estate at Morrisania, but in 1786 sold it to his brother Gouverneur. He was a member of the provincial congress of 1775; and on the close of the session was dispatched on a mission to gain the adherence of the Indians in the coming struggle. He was again in congress in 1776, and was one of the signers of the declaration of independence. His property was seized by the British, and the family homestead demolished as reprisal for this act. Mr. Morris was a member of the legislature of the state of New York after the organization of the state government.

MORRIS, Lewis Nelson, 1800–46; b. New York; grandson of Lewis (signer of the declaration of independence); educated at West Point military academy, graduating in 1820. He was occupied in garrison and frontier duty until the war with Mexico, when he went into active service, and distinguished himself at the battles of Resaca de la Palma and Palo Alto. He was killed at Monterey, being, at the time of his death, a brevet maj. and capt. of the 3d regiment U. S. infantry.

MORRIS, Lewis Owen, 1824–64; son of Lewis N. Morris; was a second lieut. in the U. S. army, and served in the war with Mexico. In 1861 he was in command of a battery stationed in Texas, and on the outbreak of hostilities, though summoned to surrender it to the confederates, refused to do so. In 1862 he was appointed col. of

the 113th N. Y. volunteers; and shortly after, being stationed at Washington, his command was converted into a heavy artillery regiment, and in the spring of 1864 was attached to the army of the Potomac and participated in all the engagements of the campaign. He commanded a brigade at the battle of Cold Harbor, June 3, 1864, where he was shot at the head of his men.

MORRIS, RICHARD, LL.D., b. England, 1833; educated at St. John's college, Battersea. He became lecturer on the English language and literature in King's college school in 1869, and took holy orders in 1871. Four years later he was made head-master of the Royal Masonic Institution for boys in 1875. He has edited a number of publications for the Early English Text Society, the Chaucer Society, and the Philological Society; and was elected president of the latter in 1874. Besides his editions of early English works, he has published, *The Etymology of Local Names* (1857); *Specimens of Early English* (1867); *Historical Outlines of English Accidence* (1872); *Elementary Lessons in Historical English Grammar* (1874); and *Primer of English Grammar* (1875). He died in 1894.

MORRIS, ROBERT, 1734–1806; b. in Liverpool, England; received a common school education only; was taken to the U. S. by his father, and when about 15 years old entered the counting-house of Charles Willing, a Philadelphia merchant, and continued in the firm for many years, gradually rising by his integrity and ability until, in 1754, he was made a partner. When the revolution broke out he had already acquired a very large fortune, and the firm was second to none in the state in the extent of its business. He at once ardently sided with the patriot party, and by assenting to the non-importation act, 1765, sacrificed great trade advantages for sake of principle. In 1775 he was a delegate to the continental congress, and was a signer of the declaration of independence, though he had opposed its adoption as ill-timed. He served for several years on the committee of ways and means, and in that capacity was of immense assistance to the cause not only by his sagacity as a financier, but by his personal credit. More than once he rescued congress from a seemingly fatal crisis by borrowing money on his own name and that of his firm; the $1,500,000 which enabled Washington to carry out his last campaign against Cornwallis was raised by his exertions and on his own notes. From 1781 to 1783 he was superintendent of finance and was vested with complete control over the monetary affairs of the country. Here again he several times used his reputation as a man of great wealth to rescue the treasury from embarrassment. The Bank of North America was founded in Dec., 1781, with a capital of $400,000 and was of great use to the government. The looseness of the confederated bond between the states and the general poverty of the people rendered the financial management peculiarly difficult and vexatious; and it was with a sense of relief that, in 1783, Morris resigned his office. Pressed to remain he reluctantly continued his duties until the end of 1784, when a commission was appointed to examine his accounts, and he issued an address, explaining his measures and promising to fulfill all obligations undertaken by him on behalf of the government. In 1786–87 he was influential in procuring the re-establishment of the North American Bank, the charter having been repealed. He was a member of the constitutional convention of 1787, and was afterward U. S. senator from Pennsylvania. He was more than once offered the office of secretary of the treasury, but refused and suggested the name of Hamilton. Unfortunate land speculations proved disastrous to his wealth; and on May 7, 1806, the man who had controlled the finances of a rising nation and by his personal exertions saved it from bankruptcy, died in a debtor's prison.

MORRIS, ROBERT HUNTER, d. 1764; son of Governor Lewis Morris; was chief-justice of New Jersey, and for 26 years a member of the council. In 1754 he was lieutenant-governor of Pennsylvania, and held the office two years.

MORRIS, SAMUEL, 1700–1770; one of the founders of Presbyterianism in Virginia, about 1750, was a resident of Hanover, and a layman in the Established Church. On reading some works by Presbyterian divines, he became convinced that his own denomination was spiritually dead, and with others withdrew and built a house of worship, called by their opposers "Morris's Reading-room." The seceders were brought into court, on complaint of the Established Church, but were quickly discharged without trial.

MORRIS, STAATS LONG, 1728–1800; b. N. Y.; grandson of Governor Lewis. He joined the British army, and in 1756 held the rank of capt.; was made lieut.col. of the 89th Highlanders, and was present at the siege of Pondicherry in India in 1761. He was brig.gen. in 1763; married the duchess of Gordon; was a member of parliament; promoted to maj.gen. in 1777, and to gen. in 1786; in 1797 was appointed governor of Quebec.

MORRIS, THOMAS, 1776–1844, b. Va.; removed in 1800 to Ohio, where he began the practice of law. In 1809 he became an associate justice of the state supreme court. After a service of several terms in both branches of the state legislature, he was elected a member of the U. S. senate. Though a democrat, he did not act with the majority of his party, but was opposed to the extension of slavery, and defended the right of the opponents of slavery to have their petitions considered by congress. His independent attitude estranged his party, and lost him his seat at the next election. In 1844 he was

the candidate for vice-president on the "liberty" ticket with James G. Birney. His *Life and Writings* were published by his son, Rev. B. F. Morris, in 1855.

MORRIS, WILLIAM, one of the most powerful of contemporary English poets, was b. near London in 1834 and educated as a painter. In 1863, with several partners he founded an establishment for designing and manufacturing artistic furniture and household decorations, and afterward was actively engaged in this business. His chief poems are *The Defense of Guenevere* (1858); *The Life and Death of Jason* (1867); *The Earthly Paradise*, 3 vols. (1868–70); *Love is Enough* (1873); a translation of Virgil's *Æneid;* and *Sigurd the Volsung* (1877). He also published translations from the Icelandic, *Hopes and Fears for Art* (1882); and in 1890 began the publication of English versions of the *Sagas*. He entered warmly into the socialist movement; became a leader in the Socialist league and a contributor to *The Commonweal;* and published *Signs of Change*, a series of lectures (1888). His latest works include *Socialism; its Growth and Outcome* (1893); *The Wood beyond the World* (1894); *The Well at the World's End* (1896); and *The Water of the Wondrous Isles* (posthumous). He d. in 1896.

MORRIS, WILLIAM WALTON, 1801–65; b. N. Y.; educated at West Point. He served, with distinction, through the Seminole war, and was with Gen. Taylor in the Mexican war. He was at Palo Alto and Resaca de la Palma, and was made military governor of Puebla, in 1847. He was stationed at Fort Kearney, Nebraska, 1853, and was in command of Fort McHenry, Baltimore, during the civil war. He was brevetted maj.gen. the day before his death.

MORRIS-DANCE, probably derived from the Morisco, popular in Spain and France. No traces of it in England before time of Henry VIII., when it became a favorite, and almost an essential feature of festivities. It is frequently alluded to in the plays and poems of the 16th and 17th centuries. At first it was danced by five men and a boy dressed as Maid Marian. The dancers wore spangled doublets and hose, flowers, ribbands, and their garments were decorated with bells of different notes, which sounded harmoniously as the dancers moved. These were called the fore, second, treble, mean, tenor, bass, and double bells, and much skill was needed to make them chime properly. From its association with the May-games, the Morris was incorporated into the pageant of Robin Hood, with various other characters—Robin Hood, Maid Marian, Friar Tuck, Little John, a clown, piper, tabourer, whifflers, and the hobby-horse. The Morris-dance was prohibited by the Puritans, and though revived at the Restoration, it never attained its former popularity. A note to Scott's *Fair Maid of Perth* contains a description of a Morris-dancer's habit. For tunes, see Grove's *Dictionary of Music*, vol. II. (London, 1880); see also Douce's "Illustrations of Shakspere" (1839); Strutt's *Sports and Pastimes* (1801); and Brand's *Popular Antiquities* (1849).

MORRIS ISLAND, situated at the entrance to the harbor of Charleston, S. C., 3½ m. long. It was connected with the very first overt act in the war of the secession, a battery at Cumming's Point, the northern end of the island, being concerned in the capture of Fort Sumter, April 12–13, 1861. It was made one of the line of defenses of Charleston, Fort Wagner and other batteries being erected upon it, and proved to be of great importance to the confederates. Early in July, 1863, the union forces made a descent on the s. extremity of the island and effected a landing; but the efforts immediately made to capture Fort Wagner proved unsuccessful. It having been concluded to reduce this important work by regular siege, parallels were opened and approaches made, beginning July 9, with the first parallel. Five parallels were established between that date and Aug. 26; and, with the assistance of the navy, a fierce attack was opened on Sept. 5, under cover of which the approaches were pushed forward, and on Sept. 6 the fort was evacuated. The island was now employed in the siege of Charleston by the union forces, by placing powerful ordnance of long range on the n. end of the island, and using these effectually to throw projectiles into the city, 4 m. distant.

MORRISON, a co. in central Minnesota, bounded on the w. by the Mississippi river, on the n. by the Crow Wing river, drained by the Platte and Swan rivers and other streams; 970 sq. m.; pop. '90, 13,325. Co. seat, Little Falls.

MORRISON, city and co. seat of Whiteside co., Ill.; on the Chicago and Northwestern railroad; 12 miles e. of the Mississippi river, 124 miles w. of Chicago. It has the Odell museum and library, Spring park, public high school, national and state banks, electric lights, waterworks supplied from inexhaustible springs, weekly newspapers, and manufactories of flour and refrigerators. It is in an agricultural, dairying, and stock-raising region. Pop. '90, 2,088.

MORRISON, ROBERT, D.D., the founder of Protestant missions in China, was b. of Scottish parentage at Morpeth, in Northumberland, Jan. 5, 1782. He studied at one of the Independent colleges, and 1805 he was sent to Macao and Canton by the London missionary society, to learn the Chinese language, and to translate the Bible into it. He reached Canton in September, 1807, and in the course of a year was appointed translator to the East India company's factory at Canton. By the year 1814 he had completed the translation and printing of the whole of the New Testament. Four years later, by the help of Mr. (afterwards Dr.) Milne, he had done the same with the Old Testament; and in 1822 he completed and printed his great *Chinese Dictionary* at an expense to the East India company of £15,000. In 1816 he acted as interpreter to Lord Amherst. In 1818

he established an Anglo-Chinese college at Malacca for English and Chinese literature, and for the propagation of Christianity. After a residence of 17 years in China, he returned to England in 1824, and brought with him a collection of 10,000 books in the Chinese tongue. In 1826 he returned to China. In 1834 he accompanied Lord Napier to Canton as interpreter, and died there Aug. 1. Besides the works already mentioned, he is author of *Horæ Sinicæ* (Lond., 1812), being translations from the popular literature of the Chinese; a *Chinese Grammar* (Serampore, 1815), and *Chinese Miscellany* (1825).

MORRISON, William, 1785–1866, b. Canada; was apprenticed to the New York fur company in 1802, and was afterwards admitted as a partner. During the twelve years of his service with the company, he explored a large part of Wisconsin and the northwest, and he is said to have been the first white man to find the source of the Mississippi. From 1815 to 1826 he managed the fur business of John Jacob Astor.

MORRISON, William Ralls, b. Monroe co., Ill., 1825. He received a public school education, and then attended McKendree coll., Ill.; was admitted to the bar, and was clerk of the circuit court; was a member of the Ill. house of representatives for four terms, and speaker for one term. He fought as a private in the Mexican war, and during the civil war was col. of the 49th Ill. infantry. He was elected as a democrat to the XXXVIIIth congress, and subsequently to the XLIIId–IXth congresses. He has distinguished himself in the house as an advocate of free trade principles; and it was chiefly through his support that John G. Carlisle was made speaker of the XLVIIIth congress. During this congress he introduced a bill "to reduce import duties and war tariff taxes," which became famous as the Morrison bill. It proposed a horizontal reduction of the tariff, and the placing of the various articles upon the free list. The free traders and the protectionists among the democratic representatives divided upon this bill, and it was finally killed by four votes. He was chairman of the committee on ways and means, 1884; and chairman of the committee on resolutions which drew up the platform at the democratic national convention, 1884. In 1887 he was appointed member of the interstate commerce commission.

MORRISSEY, John, 1831–78; b. Templemore, Tipperary co., Ireland. His parents emigrated to America, 1836, settling in Troy, N. Y., where M., on reaching manhood, opened a bar-room, and later a faro-bank. From 1849 to 1858 he was a professional pugilist, defeating many champions of the ring. He then opened a gambling-saloon in New York; became a noted Tammany politician; was elected to congress, 1865; re-elected 1868; established a magnificent gambling saloon in Saratoga, 1870; became one of the leaders of the anti-Tammany democrats; and was elected by them to the state senate, 1874, and again 1877.

MORRISTOWN, town and co. seat of Morris co., N. J.; on the Delaware, Lackawanna and Western, the Rockaway Valley, and the Whippany railroads; 16 miles w. of Newark. It contains the remains of Fort Nonsense, erected by Washington and marked by a memorial monument; the building occupied by Washington in 1779–80, now belonging to the Washington association and filled with relics of the Revolutionary period; a memorial hospital; All Souls' hospital; Young Men's Christian Association and Young Men's Catholic Association buildings; public park; Morris academy; Dana Seminary, St. Hilda's school (P. E.), and a military school; public library and lyceum; about 12 churches; gas and electric light plants; and national and state banks. Four miles from the town, at Morris Plains, is the State lunatic asylum, which cost nearly $3,000,000, has accommodations for 1,000 patients, and at the time of its completion was the largest institution of its character in the United States. The town is in the great rose and peach belt of the state, on a table-land surrounded by hills nearly 700 feet above sea level, and is almost exclusively a wealthy residential place; no effort has ever been made to foster manufacturing, and but little is done. Pop. '90, 8,156.

MORRISTOWN, city and co. seat of Hamblen co., Tenn.; on the Morristown and Cumberland Gap and the Southern railroads; 42 miles e. of Knoxville. It is 3½ miles from the Holston river, in a rich agricultural section, and has a public high school for white pupils, normal academy for colored pupils, electric lights, waterworks supplied from springs, national and state banks, and manufactories of flour, tobacco, stoves, wagons, and sash and blinds. There are quarries of variegated marble in the vicinity. Pop. '90, 1,999.

MORROW, a co. in central Ohio; 432 sq. m.; pop. '90, 18,120, chiefly of American birth. The surface is undulating and the soil fertile. Co. seat, Mount Gilead.

MORROW, a co. in northern Oregon, formed, 1885, from part of Umatilla; on the Columbia river, and drained by Willow creek and other streams. The southern part is mountainous. Pop. '90, 4205. Area, 2020 sq. m. Co. seat, Heppner.

MORROW, Jeremiah, 1771–1852, b. Penn.; settled in the northwest territory in 1805. He was a member of the convention in 1802 which framed a constitution for the new state of Ohio. He represented that state in the lower house of congress, 1803–13, and in the senate, 1813–19. He was elected governor in 1822, and served till 1826. Soon afterwards he became commissioner of canals; and in 1841–43 he was again in congress.

MORS, the largest island in the Lymfiord, in the w. of Jutland, in the kingdom of Denmark, 24 m. long, 11 m. broad; pop. 6000. The chief town is Nykjöbing.

MORSE, Edward Sylvester, ph.d., b. Me., 1838; educated at the Lawrence scientific school of Harvard university; was a founder and after 1881 the curator of the Peabody academy of sciences at Salem; founded and was editor of *The American Naturalist;* was professor of comparative anatomy and zoology at Bowdoin college, 1871–74, of zoology at the Imperial university of Tokio, 1877–79; president of the American association for the advancement of science, 1885–87. He has written many books and papers, and delivered lectures on scientific subjects, and has published *An Elementary Text Book of Zoology.*

MORSE, Jedediah, d.d., 1761–1826; b. Conn.; graduated at Yale college in 1783; in 1784 published at New Haven a small geography, which was followed by a series of geographies and gazetteers of the United States from materials collected by traveling and correspondence with J. Belknap, historian of New Hampshire, and others. These works were very popular and had a large circulation. They were published in England, and translated into French and German. He entered the ministry in 1785; was tutor in Yale in 1786; pastor of the First Church (Congregational) in Charlestown, Mass. 1789–1820. At the close of his pastorate, having received a commission from Mr. Calhoun, secretary of war, he spent two winters in visiting some Indian tribes, of which a report was published in 1822. He was editor of the *Panoplist* 1806–11, and one of the founders of Andover theological seminary. He published, besides his geographies, *A Compendious History of New England; Annals of the American Revolution; An Appeal to the Public on the Controversy respecting the Revolution in Harvard College;* and several sermons and addresses. In 1794 he received the degree of d.d. from Edinburgh. Dr. Morse, who was eminent in the New England ministry, was much engaged in religious controversy, maintaining the old evangelical faith in New England against the Unitarians.

MORSE, Richard Cary, 1795–1868; son of Jedidiah; b. Charlestown, Mass.; studied at Phillips academy, Andover, and graduated at Yale college in 1812. After graduating, he spent a year in New Haven as an amanuensis in the family of president Dwight; studied theology at Andover seminary; entered the ministry in 1817. Convinced that he was not fitted for the ministry he retired from it, and engaged with his father in the preparation of his geographies; in 1823 he united with his brother Sidney in establishing the *New York Observer*, of which he was associate editor and proprietor during the remainder of his life. He wrote largely for its columns, especially translations from French and German. In 1858 he retired from active life.

MORSE, Samuel Finley Breese, ll.d., etc.; American artist and inventor, was the eldest son of Rev. Jedidiah Morse, d.d., geographer, and was b. at Charlestown, Mass., April 27, 1791. He graduated at Yale college in 1810, and visited England with the American painter, Washington Allston, to study painting with him and Benjamin West. In 1813 he received the gold medal of the Adelphi Society of Arts for his first effort in sculpture, the "Dying Hercules." Returning to New York in 1815, he became the first president of the National Academy of Design, and was appointed professor of the arts of design in the University of the City of New York. He did not give his entire attention to art, but was interested in chemistry, and especially in electrical and galvanic experiments; and probably had his interest first awakened in the subject of electro-magnetism, through conversations with Prof. J. Freeman Dana, who lectured in New York on that subject in 1826–27, and who was a personal friend. Morse first conceived the idea of the telegraph while on board the packet-ship *Sully*, on his way from Europe to America in 1832, and was led up to the conception by the then recent discovery in France of a method for obtaining the electric spark from the magnet. This fact was established by the testimony of passengers on board the ship, and by his own evidence, and that of drawings made by him at the time. Before the close of the year 1832 a portion of the apparatus which he had devised had been constructed in New York, but it was not until three years later that, in a room in the New York university building, in that city, he showed the telegraph operating with half a mile of wire. In Sept., 1837, he made a public exhibition of his discovery, and in that year filed his caveat at Washington. No tangible result following his appeal to congress for aid during that session, Prof. Morse visited Europe with the hope of enlisting the interests of foreign governments in his invention. In this hope he was unsuccessful, and he returned to New York, where, and in Washington, he struggled under serious privations during the four years which elapsed before he obtained (1843) congressional aid, when, as he had almost yielded to despair, congress at midnight, and the last moments of the session, appropriated 30,000 dollars for an experimental line between Washington and Baltimore. And after this aid had been granted, and through the means thus afforded, he had succeeded in establishing a working telegraph line, he did not obtain his full reward for the service he had accomplished without tedious and expensive litigation with parties who contested his claims. The number and character of the honors heaped upon Prof. Morse on account of his invaluable invention have probably never been equaled in the case of any other American. He received gold medals from Prussia, Austria, and Würtemberg. France conferred upon him, through the Emperor Napoleon, the cross of the chevalier of the Legion of Honor; Denmark made him knight commander of the first class of the Danebrog, and Spain, knight commander of the order of Isabella the Catholic; from Italy he received the cross of the order of

Saints Maurice and Lazarus, and from Portugal that of the order of the Tower and the Sword. Turkey bestowed upon him, at the hands of the Sultan, the decoration of the *Nishan Iftikar*, and Yale college conferred upon him in 1846, the degree of LL.D. Public banquets were given him in London, Paris, and New York, and in June, 1871, a bronze statue of him was unveiled in Central Park.

Prof. Morse set up the first daguerreotype apparatus, and took the first daguerreotypes in America; he also laid the first submarine telegraph line (in New York harbor, in 1842); and from him, in a letter to the secretary of the treasury of the United States in 1843, seems to have come the first suggestion of an Atlantic telegraph. His death occurred about three months after his last public act—the unveiling of the statue of Benjamin Franklin, in Printing-house square, New York. See TELEGRAPH. He died in New York, April 2, 1872. See Life by S. I. Prime (N. Y., 1875).

MORSE, SIDNEY EDWARDS, son of Jedediah; 1794–1871; b. Charlestown, Mass.; graduated at Yale college in 1811; studied law in Judge Reeve's school at Litchfield, Conn.; established in 1815 the *Boston Recorder*, a weekly religious newspaper, and was for fifteen months its sole editor and proprietor. In 1817, in connection with his brother, he invented and patented the flexible piston pump. In 1820 he published a small geography, and in 1822 a larger one which was a text-book in several American colleges. In 1823 he united with his brother, Richard C., in establishing the *New York Observer*, now the oldest religious newspaper in the state. In 1839, jointly with Henry A. Munson, he produced superior map-prints by a new art which he called cerography. The first application of the art was in the preparation of maps for a school geography written by himself, of which 100,000 copies were printed and sold the first year. He continued the senior editor and proprietor of the *Observer* until 1858, when he disposed of his interest to the Rev. Dr. S. I. Prime, for many years his associate. Much of his time during the last years of his life was devoted to the invention of the cathometer, for deep-sea soundings, and he was preparing an essay on the subject at the time of his death.

MORSE, WALRUS, or SEA-HORSE (*trichecus*), a genus of amphibious mammalia of the family *phocidæ*, agreeing with the rest of that family—the seals—in the general form of the body and limbs, but widely differing from them all in the head, which is remarkable for the enormous development of the canine teeth of the upper jaw, and the tumid appearance of the muzzle caused by the magnitude of their sockets, and by the thickness of the upper lip. These great canine teeth form two tusks directed downwards, and the lower jaw becomes narrow in front, so as to pass between them. There are no canine teeth in the lower jaw. The incisive teeth are small, six in the upper jaw, and four in the lower, mostly disappearing from adult animals. The molars—at first, five on each side in each jaw, but fewer in the adult—are simple and not large; they have the crowns obliquely worn. The nostrils, as if displaced by the sockets of the tusks, open almost upwards, at some distance from the muzzle. The eyes are small, and the ears have no auricle, or, in popular language, there is no ear.—There is only one known species (*T. rosmarus*), sometimes called the ARCTIC WALRUS, an inhabitant of the Arctic seas and of the colder parts of the north temperate zone. It sometimes attains a size greater than that of the largest ox, and the tusks are sometimes 2 ft., or even 30 in. long; but the ordinary length of the tusks is only about one foot. The morse is a gregarious animal, and is often seen in great herds, which sometimes leave the water to rest for a while either on the ice or on the land, where, however, their movements are very awkward and clumsy, and the hunter assails them with much greater prospect of success than in the water. Hundreds have thus been killed at one time, although the adventure is not without danger, as they must be assailed with spears, their hide being thick enough to resist even a rifle bullet. The morse uses its tusks for protecting itself or young from attack, for combating with its enemy the polar-bear, for aiding it in climbing upon ice; but principally, it is supposed, for tearing sea-weed from submarine rocks; that being, there is every reason to think, the principal food of the animal, although it is supposed also to prey on mollusks, crustaceans, and other marine animals. The female morse shows great affection for her young, and will defend it to the last extremity; the young also remains beside the mother even after she is killed. When one of these animals is attacked, the rest of the herd—at least if in the water—hasten to its assistance. The morse is very capable of being tamed.—It is much sought after by the inhabitants of the most northern parts of the world for its skin, thongs of which seem to have been generally used in former times for ropes and cables—esteemed so valuable, that the Finlanders paid tribute in this article; whilst its oil—not very abundant—is employed like seal oil; and the tusks are very much valued as ivory, being superior in compactness to those of the elephant. The flesh is coarse, but is eaten by the Esquimaux.

The name *morse* is from the Russian *morss* or Lapp *morsk*. The name *walrus* is Norwegian (*hval-ros*, whale-horse). Another Norwegian name is *rosmar*, supposed to be from the Teutonic *ros*, horse, and *mar*, the sea. See illus. WHALE, ETC., Vol. XV., fig. 7.

MORSELLI, ENRICO AGOSTINO, Italian neurologist, b. in 1852 and graduated at the University of Modena in 1874. He wrote a number of important books on medico-legal subjects, but is best known in the United States for his work on suicide, translated into English and published in New York in 1882,—an attempt to discern, by means of statistical study, the laws determining suicide, and the reason for its increase.

He considers race an important factor, finding the greatest number of suicides among Teutonic peoples and the smallest where the Celtic element predominates. Among his other works are a critical treatise on anthropological methods and a work on animal magnetism.

MORSHANSK, a t. in the government of Tambov in Russia, 58 m. n.n.e. of Tambov, is situated on a feeder of the Oka. Pop. 22,050. Morshansk is the port for shipment of corn. It is on a railway from Tula to Samara.

MORTAGNE, t. in France, in the department of Orne, 22 m. e.n.e. of Alençon. The town is famous for its horse fair. Pop. '91, about 5000.

MORTALITY, Law of. See Vital Statistics.

MORTALITY, Statistics of. See Vital Statistics.

MORTAR. See Cements.

MORTAR, a piece of artillery which differs from a cannon in the large diameter of its bore in proportion to its length, and in the circumstance that it is usually fired at a considerable angle, so that the projectile may strike the object aimed at in a direction more or less vertical. The object for which mortars are intended is the discharge of live shells (q.v.) or carcasses. As the projectile has a large diameter, and, except in rare instances, a very great range is unnecessary, a comparatively small charge of powder is requisite. To give this its utmost power and concentration, it is confined in a hemispherical chamber at the lower end of the bore, but of less diameter. The shell completely closes this chamber; and when the explosion ensues receives its full force on its center. In the British service the ordinary mortars range in diameter of bore from 5 to 13 inches.

Larger mortars have, however, been tried at times, as at the siege of Antwerp citadel in 1832, when the French brought one of 24 inches bore to the attack. This monster, owing to its unwieldiness and other causes, was a failure. Larger still than this, though perhaps more manageable, is Mr. Mallet's great 36-inch mortar, constructed in 1855, of iron parts welded together, and now at Woolwich, rather as a curiosity than for use. As loaded shells are of immense weight, so heavy as sometimes to involve the use of special apparatus to deposit them in their places, and the mortar is fired at high elevations, the recoil is so great and so nearly vertical that no carriage could withstand the shock; it is necessary, therefore, that the mortar should be mounted on a solid iron or timber bed, by the trunnions, which are placed behind the breech, and supported in front by massive blocks of wood. This arrangement renders the apparatus so heavy that mortars of large size are rarely used in field operations, their ordinary positions being in defensive or siege works, and in mortar-vessels. Mortar batteries form an important part of the new system of coast defenses, begun by the United States war department in 1891. In that year several powerful mortar batteries were placed in position at Sandy Hook, at the approach to New York through Long Island Sound, and on the Potomac, below Washington. See Ordnance.

More wieldy, however, are the Coehorn mortars, invented by the Dutch engineer of that name, for clearing the covert-way or ditch of a fortress. This mortar is sufficiently small to be managed by one man, and is accounted useful in siege or defense operations. The French use a similar Lilliputian ordnance under the denomination of pierriers, or stone-throwers. Small mortars are likewise constructed for mountain warfare; a mule carries the mortar, another the bed, and a third is laden with the projectiles. The use of mortars is diminishing at the present time, elongated shells of great weight being now thrown from rifled cannon. See illus., Cannon, vol. III.

MORTARA, a t. in n. Italy, 25 m. n.e. of Alessandria, and about 20 m. n.w. from the city of Pavia. It is in a fertile agricultural district, in the province of Pavia, on the Arbogna, and until recently was surrounded by fortifications and high walls, which have been removed and their place occupied by elegant villas; pop. about 5000. It is the center of a number of railways and highways which give it some commercial consequence, and it contains military barracks, a theater, and good public schools. From the rice-fields in the vicinity there rises an unwholesome exhalation said to make the atmosphere unhealthy. In 774, when Charlemagne, having invaded Italy, besieged Pavia for eight months, the expedition resulting in the capture of Desiderius, one of the Lombards, and the downfall of their government, this city was the scene of a bloody battle

MORTARA, Edgar, a Jewish boy, whose abduction attracted great and painful interest throughout Europe. The facts are as follows: On June 23, 1858, Signor Momolo Mortara, a manufacturer and wholesale merchant of cloth in Bologna, and by religious profession a Jew, returning home about ten o'clock at night, found his house in the possession of the police, who informed him that they had orders from Padre Felletti, inquisitor-in-chief at Bologna, to carry off his son, Edgar, who had been surreptitiously baptized into Christianity by a Roman Catholic maid-servant. The inquisitor was waited upon by some friends of the family a little after midnight, who implored delay. He informed them that he was acting under the orders of the archbishop of Bologna, but consented to sist procedure till "next evening." The archbishop, however, was "absent" from the city, and next evening the papal cabineers entered the house and tore the child out of his father's arms." They carried him to Rome, where he was immured in a convent. The bereaved father immediately followed, obtained

several interviews with cardinal Antonelli, and offered to prove that the servant who said she had baptized Edgar had turned out to be a worthless prostitute, living in sin with Austrian officers. The cardinal declined to interfere, on the ground that the case did not come under his jurisdiction, and recommended Signor Mortara to apply to "the proper tribunals." After some weeks had passed, the child was removed to Alatri, whither his father and mother also went, and saw Edgar in a church among a number of priests, but had no opportunity of speaking to him. They returned to Rome, once more sought the presence of cardinal Antonelli, and prevailed upon him so far that he ordered the child to be brought back to the city, and allowed his parents several times to converse with him. These interviews are described as agonizing, and Edgar earnestly entreated his father and mother to take him home, but this of course was a hopeless request. He had been baptized, and baptism, no matter by whom administered, was an inviolable rite, which laid the Catholic church under the solemn obligation of protecting its son from the snares of parental infidelity. It dared not give him up. Signor Mortara and his wife had to go away without their child. The case soon became known throughout Europe, and excited great indignation, more particularly in England. The evangelical alliance drew up a protest, which was signed by the archbishop of Canterbury and above twenty other bishops, by a large number of peers, members of parliament, heads of colleges, and ministers of the gospel, by upwards of a hundred mayors and provosts, and by many other influential laymen. It was presented to Lord John Russell. The British Jews presented another. Nothing, however, was effected by these efforts. Edgar Mortara remained, of his own choice, the result would seem to prove, in the hands of the Roman Catholic church authorities. He was educated for the priesthood, became an Augustine monk of the monastery Notre-Dame de Beauchène, and preached his first sermon in 1874. The narrative, which created such excitement as echoed this boy's name over all the world, was at the time taken by the judicious as an *ex parte* statement; no authorized exposition of the facts, on the part of the Roman authorities, having ever been made public.

MORTAR-VESSEL, a class of gun-boat for mounting sea-service mortars, and in some cases provided with steam-power. The mortars are usually of the largest caliber—13 inch. To enable the mortar to be properly maneuvered, and to resist the recoil from the nearly perpendicular explosion of so great a piece of ordnance, the vessel has considerable breadth in proportion to her length. The mortar is slung amidships in a massive bed. The ancient form of mortar-vessel was the "bomb-ketch," convenient because of the length of deck without a mast. The present vessels originated during the Russian war, and were found serviceable at the bombardment of Vicksburg.

MORTGAGE, in American law, is the temporary pledging of land in security of a debt; and as the land cannot be delivered into the creditor's hand, he acquires a hold over it by a deed called an indenture, or deed of mortgage. The ordinary form of a mortgage deed resembles an absolute conveyance, but it contains a proviso that if the money borrowed is repaid within a certain time, then the mortgagee shall reconvey the land to the mortgagor or borrower. In early times the only way to create a mortgage under the common law was to give livery of seizure of a freehold estate, thus passing the estate to the pledgee and his heirs. Afterwards a peculiar form of mortgage was created as an estate for years, the only right of the mortgageor being to pay the debt on the day specified, and thus clear his land of the obligation. If he failed to do this the estate was lost beyond recovery. The modern doctrine that time is not of the essence of the contract was established by equity courts and is founded on the distinction in Roman law between *hypotheca* and *pignus;* if the property was left in the hands of the mortgageor, the law of *hypotheca* was applied; if given over to the mortgagee, the law of *pignus.* While the common law considered a mortgage as a freehold estate, equity preferred to regard it as a pledge, and, as equity is supreme within its own domain, the entire law relating to the subject has now come under the control of its courts, and the old feudal ideas have given way. Three views then might be taken—that a mortgage is an estate possessing all the common-law incidents except that it is not absolute until foreclosure has been had; that it is a *quasi* interest of the mortgagee in the land without those incidents; or that it is a *pledge* (*hypotheca*) with the right of foreclosure. In every mortgage the estate and the debt or obligation are distinct, and the mortgagee cannot have seizin until the debt is due, though the decisions in some of the states seem to recognize a title before the time set for payment. Whether the assignment of the debt do or do not carry the mortgage with it is also a point on which the laws of the different states are not uniform. A conditional sale is often closely akin to a mortgage. In the latter there is a contract right of the creditor to obtain the land at some time after the non-payment of a debt which is a charge on the land; while in a conditional sale the contract stipulates that the vendor may repurchase at a fixed price; the existence or non-existence of intention to procure a loan or obligation making the distinction. The tendency of courts is to consider such an agreement a mortgage, if there be any doubt. Where there is clearly a conditional sale intended there is no equity of redemption in the vendor after the date specified. This, it will be seen, makes it of great importance to ascertain the true nature of the contract. A recent case on the subject is that of Bassett *vs.* Bradley, reported in the volume of the Connecticut reports issued 1880.

No special form of words is necessary to create a mortgage, if it be clear that the real property is held for payment of the obligation. Wherever the statute of frauds is in force, the mortgage must conform to its provisions. As to construction, parole evidence may be received to prove the existence of a condition, even though the deed seems on its face to be absolute. This, however, is allowed only when the parties have not reduced the whole of their negotiations to the form of a written contract; otherwise the usual rule as to written instruments applies. Though no special form of language must be used, yet the mortgage debt must be so described as to be intelligible to the examination of an interested party. If the obligation of the mortgage be to pay money it is almost always accompanied by a note or bond, but this is not necessary. If the obligation be to perform or not to perform a particular act, a bond should be given. If the note be lost, the loss must be set out in the pleadings, as it is the evidence of the debt which the mortgage is given to secure.

The rights and relations of the mortgageor and mortgagee are governed by the local laws of the states, the only universal rights being that of the mortgageor to pay before foreclosure, and of the mortgagee to hold the property for the debt. The provisions as to registration and foreclosure can be learned only by reference to the statutes of each state. Where the seizin is considered as in the mortgagee, he has the right to enter at any time, and, after entry, is regarded as a tenant in possession, and liable to the mortgageor for rents or profits received. No essential change in the property can be made by the mortgageor without the consent of his mortgagee. After foreclosure the mortgagee either takes the estate or the property is sold under statute regulations to satisfy the debt. He may bring an action for his debt in a court of common law if he choose, but must do so, if at all, within the time set by the statute of limitations. The usual method of foreclosure is by bringing a bill in equity setting out all the particulars of the mortgage contract and asking that a day be appointed before which the debt must be paid or the foreclosure proceed. Notice must be given to all parties interested. If there be several mortgagees, the court will appoint a day before which the mortgageor must redeem, a subsequent day before which the last mortgageor may assume the mortgage on which foreclosure is asked, and so on up to the mortgagee who brings the petition. If payment be not made, a certificate of foreclosure is issued and recorded. If the mortgage be an absolute one, the foreclosing party acquires full title to the property; but a strict foreclosure is unusual, the law generally providing that the land or other real property shall be sold at auction, and the claims paid in order of precedence, so far as the proceeds will allow. By common law, if the sum realized will not pay the amount of the debt, the mortgagee has no further remedy, but, by the laws of most of the states, the property is appraised, and judgment given by the court of equity for the excess, though sometimes the mortgagee is sent to a court of law for remedy. The mortgagee may refuse to accept payment before the day fixed. A tender of payment on the proper day met by refusal will usually release the mortgageor, but tender after that date is of no avail. The mortgagee may be compelled by law to give a release or quit claim deed after receiving payment, and it should always be required in order to make the record of title clear. Where the mortgagee has had the right of entry, and has applied rents or profits to the payment of the debt, the mortgageor may by a bill in equity be made to account therefor; he is also liable for waste, or any act tending to injure permanently the value of the property. This follows from the doctrine of equity that the seizin has not left the mortgageor. Assessments for public improvements in most states take precedence over mortgage liens. When a mortgaged property is sold it has been held in New York that the vendee does not become responsible for the mortgage debt beyond the value of the land, unless he specially assume the lien; but this is not the case in other states. Where the mortgage and debt are held to be one, they both pass on assignment of mortgage, but elsewhere they are severed. If the mortgage is paid in full by one of two or more mortgageors, the others are compelled to contribute, and equity considers him as an assignee of the whole mortgage.

MORTIER, Édouard Adolphe Casimir Josephe, Duc de Treviso; 1768–1835; first a soldier under the republic in 1790, adj.gen. in '93, in the battles of Mons, Bruxelles, Louvain, under Gen. Kleber in 1794, repulsed the Austrians on the German frontier in 1796 and retook Mayence; gen. of division in 1799, charged by Napoleon with the conquest of Hanover in 1803, made marshal in 1804, head of an army corps in 1805, distinguished for skill in making resistance to an overwhelming force of Russians at Leoben the same year, in 1806 occupying Hanover and making the siege of Stralsund; in 1807 beat the Swedes at Anclam and Friedland; and at the peace of Tilsit June 21, was made governor of Silesia and duke of Treviso. In 1808 in Spain at the siege of Saragossa, and the battles of Ocana and Gebora; in 1809–11, with the French army in the Russian campaign, received the order to blow up the Kremlin, and after the battle of Krasnoë in Nov. 1812 commanded the rear-guard in retreat; arrived at Frankfort-on-the-Main late in 1812 and participated in the bloody battles of Bautzen, Dresden, and Leipsic early in 1813; fought in retreat with Napoleon in 1814, and when the latter was beaten, and at Elba, gave adhesion to the government of Louis XVIII. On the return

of Napoleon from Elba joined him, and received command of the eastern department of France. After the Hundred Days he was reinstated in office by Louis, became member of the chamber of deputies in 1816, and of the chamber of lords in 1819. After the revolution of 1830 he was made ambassador at St. Petersburg, grand chancellor of the Legion of Honor in 1831, minister of war and president of the council under Louis Philippe in 1834–35, and died by a missile from the infernal machine of Fieschi while engaged in a public review by the king's side.

MORTIFICATION, in Medicine. See INFLAMMATION.

MORTIMER, ROGER, earl of March, 1287–1330, also baron of Wigmore; for some years a faithful adherent of Edward II. and his representative in Ireland, but in 1320 joined the insurgent barons who were hostile to the favorite, Despensers. In 1322 Mortimer was captured at Boroughbridge and imprisoned in the Tower of London, but escaped to France. There he met and fascinated queen Isabella, wife of Edward, became her paramour, and determined upon the overthrow of the king. With a small force he landed on the English coast and was soon joined by large numbers of the discontented nobles and common people. The king was defeated, taken prisoner and soon assassinated in his dungeon. Mortimer took the title of earl of March and was given confiscated estates of great value. Edward III. was but 14 yrs. old, and though a council held the regency, Mortimer's influence was supreme. He caused the death of Kent and Lancaster, both uncles of the young monarch. The latter resolved to be king in fact as as well as name, had the earl of March seized at Nottingham castle and summoned a new parliament. Mortimer was tried on charges of treason; condemned, and in 1330 hung, drawn and quartered near Smithfield.

MORTISE AND TENON (Fr. *mortaise*, probably from Lat. *mordere*, to bite; *tenon*, from *tenir*, to hold), a form of joint in carpentry. The tenon is a projection, generally rectangular in form, on the end of a piece of wood, cut so as to fit exactly into a deep groove (called the mortise) cut in another piece, so that the two are united at a required angle. The framing of doors, shutters, and such pieces of joinery, is usually fitted together with mortise and tenon joints.

MORTMAIN, THE STATUTES OF (Fr. *mort*, dead, and *main*, hand). The object of the statutes of mortmain is to prevent priests and others from importuning a dying man to convey his land for charitable purposes. Hence, though a person can, up to the last hour of his life, if possessing sufficient knowledge of what he does, devise by will all his land to individuals absolutely, it is otherwise if he intend to give the land to trustees for a charitable purpose, as to build a church, or school, or hospital. The statute of mortmain, 9 Geo. II. c. 36 (1736), reciting that public mischief had greatly increased by many large and improvident dispositions made by languishing and dying persons to charitable uses, to take place after their deaths to the disinherison of their lawful heirs, enacted, that in future no lands or sums of money to be laid out in land should be given to any person or body, unless such gift or conveyance should be made or executed in presence of two witnesses twelve months before the death of the donor or granter, and be enrolled in the Court of Chancery within six months after the execution. Therefore, a person on death-bed cannot in England give land, or money to buy land, for a charitable purpose. It can only be done in the life of the donor, at least twelve months before his death; and the property must be completely alienated, so that he has no further control over it. The deed must have a present operation, and must not reserve any life-interest to the donor; it must be done at once and for ever. The policy of this statute has sometimes been questioned, and several well-known modes of evading the statute have been adopted from time to time.

Mortmain is, then, the alienation of real estate to a corporation. The term, however, is generally used of religious corporations. In consequence of the feudal restrictions on alienation, a corporation was obliged to get a mortmain license to make a valid purchase of lands. One of the chief objections to the alienation of land to religious corporations, was the loss to the lord of the fee, of the ordinary feudal profits, such as reliefs, wardships, and marriages, by the vesting of land in a technical person who cannot die or suffer attaint. The license of the sovereign was necessary, as the lord to whom, in the last resort, the fee would ultimately revert. If there were an intermediate lord between the alienating tenant and the king, his license must also be obtained for the alienation; for want of such license, the land was forfeitable to the lord, after entrance. Licenses were necessary in Saxon times, and after the conquest they are recognized in the constitutions of Clarendon. But the church continued to increase its lands, in spite of the restriction. The estate alienated without a license reverted, in the first instance, to the immediate lord of the fee. To escape this forfeiture, the tenant made a conveyance to the religious corporation, and then held the land as its tenant; the corporation thus obtained a sufficient seizin, to enable them to enter upon the land as immediate lord, under color of a surrender or forfeiture. By the 36th chapter of Magna Charta, such conveyances were made void. The prohibition in Magna Charta applied to religious houses only, so that religious corporations sole were exempt from its provisions; and the religious houses evaded it, by buying in lands that were really holden of themselves as lords of the fee, or by taking long terms for years. To meet these evasions, the statute 7 Edw. I., *De Religiosis*, was passed.

The restrictive statutes applied to conveyances between the parties only, and the religious houses evaded them by bringing a suit to recover the land on a pretended title, in collusion with the tenant who would let the suit go by default. This kind of collusive suit came afterwards into general use under the name of a *common recovery*. The 2d statute of Westminster enacts a prohibition of this evasion, and the statute *Quia emptores*, permitting free alienation, expressly excepts alienation in mortmain. The next ecclesiastical device was to convey the land to feoffees to the use of the religious houses. The seizin thus remained in the feoffees, who were held by chancery to account for the rents and profits. This was the origin of uses and trusts. The statute 15 Richard II. declares all lands conveyed to the use of ecclesiastical persons, without the license of the king or intermediate lord, to be forfeited. The statute 23 Henry VIII. prohibited the conveyance of land for superstitious uses to non-corporate bodies also. Meanwhile it has always been possible for the crown to grant a mortmain license enabling a corporation to purchase and hold lands. The mortmain acts have not been re-enacted in the United States except in a very few states; a corporation can hold land, but only a charitable corporation can take by devise. In some states the amount which can be bequeathed to charitable uses is limited by statute; within that limit the devise is good.

MORTON, a co. in the southern part of N. Dakota, drained by the Missouri, which bounds it on the e., and by the Cannonball and Heart rivers. It is very scantily settled, the population in '90 being 4728. The surface is a rolling prairie with little wood. The Northern Pacific railroad passes through. Fort Abraham Lincoln and Fort Rice are on the e. border. Area, 3168 sq. m. Co. seat, Mandan.

MORTON, Fourth Earl of (James Douglas), b. 1530, regent of Scotland, the second son of sir George Douglas of Pittendriech, in 1553 succeeded, in right of his wife, Elizabeth, daughter of the third earl, to the title and estates of the earldom. He early favored the cause of the reformation, and in 1557 was one of the original lords of the congregation. Sworn a privy councilor in 1561, he was appointed lord high chancellor of Scotland Jan. 7, 1563. Having been one of the chief conspirators against Rizzio, the Italian secretary of Queen Mary, on his assassination, Mar. 9, 1566, he fled with his associates to England, but, through the interest of the earl of Bothwell, soon obtained his pardon from the queen. Though privy to the design for the murder of Darnley, on the marriage of the queen to Bothwell, he joined the confederacy of the nobles against her. He was present at Carberry Hill when Bothwell parted from the queen, and after Mary's imprisonment in the castle of Lochleven he was restored to the office of high chancellor, of which he had been deprived, and constituted lord high admiral of Scotland. On the death of the earl of Mar, in Oct., 1572, he was elected regent of the kingdom. His rapacity and avarice made him obnoxious to many of the nobles, and as the young king, James VI., desired to assume the reins of government, Morton resigned the regency in Mar., 1578. Subsequently obtaining possession of the castle of Stirling, with the person of the king, he recovered his authority, but was accused of participating in the murder of Darnley, and being tried and condemned, was beheaded at Edinburgh, June 2, 1581.

MORTON, Charles, 1626–95; b. England; educated at Oxford. He took orders in the English church, and was at first attached to the royalist party. He afterwards sided with the Puritans, and was obliged to give up his living in Cornwall on account of nonconformity. Soon after 1662 he opened a school at Newington Green, where Daniel Defoe was one of his scholars. To escape the persecution of the ecclesiastical courts he came to Massachusetts bay in 1686, accompanied by his pupil Penhallow, the future historian of the Indian wars. The same year, he became minister of the church in Charlestown, where he remained till his death. During a part of this time he was vice-president of Harvard college, and wrote a system of logic for use there.

MORTON, George, b. England, 1585; joined the Separatists, and settled, with his brother Thomas, at Leyden. He went over to London in 1620, where he became the agent of the Separatists. In 1623 he came to Plymouth, Mass., in the ship Ann, bringing emigrants and supplies to the pilgrims. Some years later he went back to England, where he died at a date unknown. He published in England, in 1622, a description of the Plymouth colony, under the title of *Mourt's Relation.*

MORTON, Henry, ph.d., b. New York, 1836; educated at the university of Pennsylvania. He first studied law, but afterwards took up chemistry, and in 1863 became professor of chemistry in the Philadelphia dental college. In 1869 he conducted a number of parties sent out to take photographs of the solar eclipse of Aug. 7, and the same year he took the chair of chemistry in the university of Pennsylvania. In 1870 he became president of the Stevens Institute of Technology, at Hoboken, N. J. He has contributed many papers to scientific periodicals, such as the *Chemical News* and the *Philosophical Magazine.*

MORTON, James St. Clair, 1829–64, b. Philadelphia; graduated at West Point in 1851, and was appointed to the engineers. After serving as assistant professor of engineering at the academy, and taking charge of various works, he went to Central America at the head of the Chiriqui expedition in 1860. In the spring of 1862 he became chief engineer of the army of the Ohio, and in the following October was appointed to the same position in the army of the Cumberland, and soon afterwards he was made

brig.gen. He built the intrenchments at Murfreesboro, and was engineer of the works at Chattanooga, in whose capture he took a prominent part. In 1864 he became chief engineer of the 9th army corps in Virginia, and served through the Richmond campaign, up to Petersburg, participating in the engagements at North Anna and Bethesda church. He was killed June 17, at the head of the union assault on Petersburg. He published a number of works on engineering and fortification.

MORTON, John, Cardinal, Archbishop, 1420–1500; b. England; educated at Cerne Abbey and Oxford. Through his practice in the court of arches he attracted the attention of Cardinal Bourchier, who presented him to Henry VI. who made him a member of the privy council. Edward IV. also took him into favor, made him master of the rolls in 1473, and in 1478 bishop of Ely, and lord chancellor. He was not in favor with Richard III., who arrested him, and committed him to the custody of the duke of Buckingham, from whom he escaped and fled to the earl of Richmond on the continent. He is said to have suggested the union of the houses of York and Lancaster, by the marriage of Richmond with the daughter of Edward IV. Henry VII., on his accession, made Morton a member of the privy council, and on the death of cardinal Bourchier he was promoted to the see of Canterbury. In 1487 he was again appointed lord chancellor, and in 1493 pope Alexander VI. made him a cardinal. The English life of Richard III. which bears the name of sir Thomas More has been attributed to Morton.

MORTON, John, 1724–77; b. Penn.; a surveyor by profession. In 1756 he was elected to the Pennsylvania legislature, in which he served for many years, part of the time as speaker. He was a delegate to the stamp act congress, convened at New York in 1765, and for the next four years was high sheriff for Chester co., the present Delaware county. Soon afterwards he became a justice of the court of common pleas, from which he was promoted to the state supreme court. In 1774 he was elected to the continental congress, where he gave the decisive vote of his state delegation for the declaration of independence, and acted as chairman of the committee of the whole on the proposals for confederation.

MORTON, Julius Sterling, was born in Adams, Jefferson Co., N. Y., in 1832. His parents subsequently settled in Michigan, whence he removed to Nebraska, where for many years he pursued farming near Nebraska City. He published the first newspaper that the state ever had; served a term as territorial governor, and as acting governor (in 1866); and is well known as the originator of Arbor Day (q.v.). In March, 1893, he was appointed secretary of agriculture in the cabinet of President Cleveland.

MORTON, Levi Parsons, b. Vt., 1824. Early in life he was in business at Hanover, N. H., and after five years he removed to Boston. He settled in New York, 1854, and became one of the most successful of its business men; was elected as a repub. to the XLVIth and XLVIIth congresses. He was sent as an honorary commissioner to the Paris exposition, 1878; and was appointed minister to France by Pres. Garfield, 1881, serving until 1885. In 1888 he was elected vice-president of the United States; and in 1894 governor of New York.

MORTON, Marcus, ll.d., 1784–1864; b. Mass.; educated at Brown University, and admitted to the Massachusetts bar. He obtained a good practice, and became an active democratic politician. He served in congress, 1817–21; was a member of the state executive council in 1823; and the next year was elected lieut.-governor. He sat on the bench of the state supreme court from 1825 to 1839, when he was elected governor of Massachusetts, beating Edward Everett, the whig candidate, by one vote. He had been an unsuccessful candidate for many years for this office, to which he was again chosen in 1842. He was collector of Boston during the administration of President Polk.

MORTON, Nathaniel, 1613–85; b. England; came with his father to America in 1623. On the death of his father he was taken into the family of Gov. Bradford, whose wife was his maternal aunt, and early assisted the governor in public affairs. He was secretary of the colony in 1645, holding the office till his death. He had received a good education, and almost all the records of Plymouth colony during the 17th c., which were published in several large volumes by the government of Massachusetts, were in his handwriting. He published the *New England Memoriall; or a Brief Relation of the most Memorable and Remarkable Passages of the Providence of God manifested to the Planters of New England*, etc. It was compiled mainly from the manuscripts of his uncle, William Bradford, and the journals of Edward Winslow, and included the period 1620–46. In 1680 he wrote a history of the Plymouth church.

MORTON, Oliver Perry, 1823–77; b. Ind.; the family name, Throckmorton, was shortened by his father. He was educated at the Wayne co. (Ind.) seminary, and Miami university, Oxford, Ohio; studied law, and was admitted to practice at Centreville, Ind., in 1847. He rose to be a leading member of the Indiana bar, and in 1852 was elected a circuit judge. At an early age he interested himself in politics, at first as a democrat, but became a republican on the formation of that party. He ran for governor of Indiana in 1856 on the republican ticket; was defeated, and returned to the practice of law; but in 1860 was elected lieut.-governor of the state; the governor having been chosen U. S. senator, Morton became governor, Jan. 16, 1861. The beginning of the rebellion found the state legislature and the attorney-general of Indiana democratic, and thus a fierce and active opposition against furnishing aid for the prosecution of the war. Gov. Morton, who gained the sobriquet of "the great war governor," devoted

himself, heart and soul, to plans for placing Indiana strongly on the side of the union, and even effected a sufficient loan on his personal responsibility to meet the exigencies of the situation: this obligation was afterwards assumed by the state. In 1864 he was elected governor by a large majority; but in the following year experienced a stroke of paralysis, and was obliged to go to Europe for his health. He was absent only a few months, and on his return resumed the duties of his office. In 1867 he was elected to the U. S. senate; and on the expiration of his term, in 1873, was re-elected for the term ending in 1879. In the senate he became the recognized leader of the republican party, while he accomplished a prodigious amount of labor, serving on the committees on foreign relations, agriculture, military affairs, private land claims, and privileges and elections. He was one of the principal promoters of the passage of the fifteenth amendment to the constitution, and sustained the administration in the effort to carry through the senate the proposed San Domingo treaty. For this last service he was offered the English mission, which he declined on the ground that his acceptance would involve the election of a democratic senator in his place by the legislature of Indiana. At the republican national convention in 1876, Senator Morton received 124 votes on the first ballot for president. He was a member of the electoral commission called to decide the question of the disputed presidential election; and afterwards strongly pressed an amendment to the law directing the method of counting the votes. Senator Morton was a man of powerful intellect and determined will, and an orator of great popularity through his vigorous and straightforward speech. During the latter part of his life his infirmities necessitated his use of assistance in moving about, and he had to be carried from the lobby of the senate chamber to his carriage. In his prime he was over 6 ft. in height, with a powerful physique.

MORTON, Samuel George, m.d., American physician and ethnologist, son of an Irish emigrant, was b. in Philadelphia, Jan. 26, 1799. He studied medicine in Philadelphia, Edinburgh, and Paris, and in 1824 settled in Philadelphia, where he contributed papers on physiology and craniology to scientific journals. In 1834 he visited the West Indies, and made observations on the development of races. In 1839 he was appointed professor of anatomy in the Pennsylvania medical college, and published his great work, *Crania Americana*, based on his collection of 867 classified skulls. In 1844 he published *Crania Ægyptiaca*, based on the collection of George R. Gliddon, esq.; and in 1849 his last work, *An Illustrated System of Human Anatomy, Special, General, and Microscopic.* He died at Philadelphia, May 15, 1851. Morton may be regarded as the first American who endeavored to place the doctrine of the original diversity of mankind on a scientific basis. See the memoir of Morton prefixed to Nott and Gliddon's *Types of Mankind* (Philadelphia, 1854), a work largely illustrated by selections from his unedited papers.

MORTON, Sarah Wentworth Apthorp, 1759–1846; b. Mass.; married in 1781 to Perez Morton. She acquired considerable reputation by her verses contributed to the *Massachusetts Magazine*, over the signature of "Philenia." Under that pseudonym she published at Boston, in 1790, *Ouâbi, or the Virtues of Nature; an Indian Tale, in* 4 *cantos.* This work was followed in 1797 by *Beacon Hill*, a poem in 5 cantos; and in 1823 by *My Mind and its Thoughts*, a mixture of verse and prose pieces.

MORTON, Thomas, 1590–1645; b. England; a lawyer and member of Clifford's Inn, London. He came to this country with Weston's colony in 1622. He soon returned to England, but came to Massachusetts bay with Wollaston in 1625, and took up his residence at Mount Wollaston, now a part of the town of Braintree. Morton called his settlement "Merry Mount," set up a may-pole there, and very much scandalized the Plymouth people by his merry-making. A small party came up from Plymouth in 1628, cut down the may-pole, took Morton to Plymouth, and sent him thence to England. Morton ventured to return in 1629, but was again sent home, and the next year his house at Wollaston was demolished. Morton, however, came once more to Massachusetts in 1643, and was imprisoned for a year by the authorities on account of his "scandalous book," *The New England Canaan*, which he had published in England in 1632. This work contains a valuable account of the condition of Massachusetts, mingled with amusing satire on the Puritans. The late J. L. Motley made Morton the subject of two novels, *Morton's Hope* and *Merry Mount.*

MORTON, William Thomas Green, 1819–1868, b. Mass.; commenced studying dentistry in Baltimore in 1840, continued there for 18 months and settled in Boston. He is, more than for anything else, known as the introducer and discoverer of the surgically useful anæsthetic properties of sulphuric ether. His attention was first called to the subject in 1844 when attending lectures at the medical college in Boston, and after some experiments performed upon himself, he administered the ether to a man Sept. 30, 1846, and extracted a firmly rooted tooth without pain. He repeated the operation, and making known the results to Dr. John C. Warren, he administered ether at the latter's request in the Massachusetts General Hospital, Oct. 16, 1846, to a man for the operation of removing a tumor from the jaw. Dr. Morton obtained a patent for the use of ether, under the name of "letheon," in 1846, a month after the operation in the hospital, and a month after this, in England, Dr. C. T. Jackson also claimed the honor of having made the discovery, and the Montyon prize of the French Academy was

equally awarded to Dr. Morton and to Dr. Jackson, but Dr. Morton declined to accept it, which resulted in his receiving in 1852 the large gold medal, the Montyon prize in medicine and surgery. He claimed compensation from congress for his invention, the government having used it, and also from individuals, and he was involved in many suits. He received, however, no compensation, and his life was spent in contests, literary and legal, in regard to his invention. Memorials were presented to congress signed by many physicians, but for one reason or another they failed to secure what was asked. His latter years were spent upon a farm at Wellesley, Mass., where he d. from an affection brought on by reading an article which sought to deprive him of the merit of his discovery.

MOSA'IC, the art of producing artistic designs by setting small square pieces of stone or glass of different colors, to give the effect of painting (Greek *mouseîos*, of the Muses). The origin of the art is buried in obscurity; it was, however, much practiced by the ancient Romans, especially for ornamental pavements, specimens of which are almost always found whenever the remains of an old Roman villa are discovered. Under the Byzantine empire, it was also much used for the ornamentation of churches, in which it formed a large portion of the wall-decoration. It was re-introduced into Italy for the latter purpose about the middle of the 13th c. by Andrea Tafi, who learned it of some Greek artists employed at Venice in decorating St. Mark's. Since then it has been especially an Italian art, and to such wonderful perfection has it been brought, that most minute pictures are produced by it. Within quite recent years, mosaics of surpassing, beauty both in design and material, have been produced by Russian artists in the Imperial glass manufactory of Russia: those shown in the Russian department of the international exhibition (1862) have probably never been surpassed. The pieces of glass of every shade of color are technically called *smalts;* they are generally opaque, and are set in cement in the same manner as tiles or pavement. Some fine pieces of mosaic pavement have lately been produced in Great Britain by Messrs. Minton & Co. of Stoke-upon-Trent, and by Messrs. Maw of Brosely, proving that the art only wants sufficient encouragement to obtain a high position. In Italy there are two very distinct varieties of mosaic work—i.e., the Florentine and the Roman; the former is entirely formed of pieces of stone or shell of the natural colors, and is limited in its application chiefly to floral and Arabesque designs. The later is made of the glass smalts mentioned above, and has so wide an application that most of the finest paintings of the best old masters have been copied in mosaic, and the pictures so taken form the almost imperishable decorations of the finest churches of Italy. The manufacture of the opaque glass or smalts for making the little square pieces called tesseræ of which the pictures are composed, is a very important one, and is carried on in the Vatican, where 25,000 shades of the various kinds of colored glass are produced.

MOSAIC GOLD. See Tin.

MOSAIC WOOL, or Wool Mosaic, is a remarkable application of the principle of mosaic-work to the production of woolen or worsted rugs and carpets, having a definite design or pattern, independent of the ordinary processes of printing and weaving. Many attempts in this direction have been made, chiefly on the continent; but the most successful is that of Messrs. Crossley, in whose extensive carpet factory at Halifax the mosaic wool is produced as a regular department of manufacture.

In the first place, well-spun worsted threads are dyed to every color and almost every shade or tint, amounting to a hundred varities in all. An artist prepares a full-sized drawing of the pattern or design, ruled all over with cross-lines; this is copied on lined paper by girls, each of whom takes as much of the pattern as will fill a square foot. A workman (or woman) having a good eye for color, examines each square piece of drawing in detail, and selects the proper color of thread suitable to every portion of it; the threads are a little over 200 in. long each, or about 17 ft., and are numerous enough to pack closely together into a mass of one sq. ft. in width and depth. A strong iron framework, 17 ft. long, is so arranged that all these threads can be stretched on it horizontally, tied at one end, and weighted with 4 lbs. to each thread at the other. Girls, under the direction of the workwoman who selects the colors, arrange these threads one by one, tying them at one end, weighting them at the other, and supporting them on a steel bar in the middle. This being done, the mass of 17 ft. in length is cut up into blocks of 20 in. long each, for convenience in after-operations. All these processes are for one sq. ft. only of the pattern, and they have to be repeated as many times as there are sq. ft. in it. Supposing a rug 6 ft. by 2, with a lion, tiger, or other device occupying the greater part of the surface: there must be 12 masses prepared, and as each mass contains 50,000 threads, there will be 600,000 altogether. Blocks are cut from each mass, and are placed in an iron box or frame, side by side; thus forming a quadrangular solid 6 ft. by 2, and 20 in. deep, with the threads arranged *vertically*. Now, to convert this into a great number of separate rugs, the pattern of which is seen represented on the upper surface, formed by the ends of the colored threads, india-rubber is dissolved in camphine to the consistence of carpenter's glue, and brushed well over the top, so that every individual thread shall receive its portion; this being dried, a second coating is applied; and afterwards a third. A backing of canvas, or of some kind of strong cloth, is cemented down upon the mass of threads by a glue of the same kind, and is scraped

and rubbed until it adheres to every individual fiber. When dry, the mass of threads is raised up three-sixteenths of an inch, by a screw acting upon a movable bottom to the box. A very keen circular cutter, 12 ft. in diameter, and rotating 170 times per minute, quickly severs a horizontal slice three-sixteenths of an inch thick, the box of threads being caused by an endless screw to travel onward to meet the cutter. This slice when turned up, presents the picture complete, in a beautifully soft nap, or pile of woolen threads, supported by a canvas or woolen backing. It is a mere question of hand-work to convert this into a rug, carpet, coverlet, or wrapper of any kind. A second repetition of the same processes converts another slice into a second rug; and so on, until the mass of 20 in. in depth has been cut up into about a hundred slices, each forming one rug. As the blocks of 20 in. were originally cut from a mass of 200 in., the whole mass produces about a thousand rugs, all exactly the same pattern. It is this power of repetition which makes the process pay; for the great preparatory labor of selecting and arranging (say) 600,000 distinct threads could not otherwise be compensated for.

MOSAYLIMA (Little Moslem), one of the most important rivals of Mohammed, belonged to the clan Dûl, a division of the tribe of the Bani Hanifah, of Yamâma in Nedjed. The traditions about his life and age are extremely contradictory and legendary. It appears, however, tolerably certain that he had risen to a certain eminence in his tribe, probably as a religious teacher only at first, before Mohammed assumed his prophetical office. The name he was known by among his friends was Rahmân, the Benignant or Merciful; a term which Mohammed adopted as a designation of God himself. This word, which is Aramaic, was a common divine epithet among the Jews, from whom Mohammed took it, together with a vast bulk of dogmas, and ceremonies, and legends. If, however, Mosaylima, as is supposed by some, assumed that name in the meaning of Messiah, Savior, it would prove that he had anticipated Mohammed in the apostleship, which is commonly denied. It was in the ninth year of the Hedjrah that Mosaylima, at the head of an embassy sent by his tribe, appeared before Mohammed, in order to settle certain points of dispute. The traditions are very contradictory on the circumstance whether or not Mosaylima was then already the recognized spiritual leader of his tribe. When they were introduced to Mohammed in the mosque, they greeted him with the orthodox salutation of Moslems—viz., "Salâm alayk" (Peace upon thee), and after a brief parley, recited the confession of faith. Shortly after this event, Mosaylima openly professed himself to be a prophet, as well as Mohammed. The latter sent a messenger to him, as soon as he heard of this, to request him to reiterate publicly his profession of Islam. Mosaylima's answer was a request that Mohammed should share his power with him. "From Mosaylima, the apostle of God," he wrote, according to Abdufeda, "to Mohammed, the apostle of God. Now let the earth be half mine, and half thine." Mohammed speedily replied: "From Mohammed, the apostle of God, to Mosaylima, the liar. The earth is God's: he giveth the same for inheritanee unto such of his servants as he pleases, and the happy issue shall attend those who fear him." Yet notwithstandiug these testimonies, of probably late dates, it seems, on the other hand, perfectly certain that Mohammed made very great concessions to his rival—concessions that point to his having secretly nominated Mosaylima his successor, and that he by this means bought Mosaylima's open allegiance during his lifetime. It was not a question of dogmas, though they each had special revelations, but a question of supremacy, which was thus settled amicably. "Mohammed," Mosaylima said, "is appointed by God to settle the principal points of faith, and I to supplement them." He further had a revelation, in accordance with Mohammed's: "We have sent to every nation its own prophet," to the effect: "We have given unto thee [Mosaylima] a number of people; keep them to thyself, and advance. But be cautious, and desire not too much; and do not enter into rival fights."

When Mohammed was at the point of death, he desired to write his will. Whatever he may have wished to ordain, is uncertain; it is well known, at all events, that his friends did not obey his order, and refused to furnish him with writing materials, very probably because they did not like to be bound by his last injunctions. Sprenger supposes that he wished formally to appoint Mosaylima his successor, and that it was just this which his surrounding relations feared. Mosaylima then openly declared against Islam, and many parodies of the Koran sprang up in the Nedjed, ascribed to him. In the 11th year of the Hedjrah, it at last came to an open breach between the two rival powers. Abu Bekr, the caliph, sent Khalid, "the sword of the faith," with a number of choice troops, to compel Mosaylima to submission. Mosaylima awaited the enemy at Rowdah, a village in the Wadi Hanifah. So formidable indeed was Mosaylima's force, that Walid is said to have hesitated for a whole day and night before he undertook an assault unanimously disapproved of by his council. On the second morning, however, he advanced, and in a battle which lasted until the evening, contrived, with fearful losses of his own, to gain the victory. Mosaylima fell by the hands of a negro slave, and his head was cut off by the conqueror, and placed at the head of a spear, to convince both friends and foes of his death. Khalid then advanced to the slain prophet's birthplace, in order to slay all its inhabitants. They, however, by a clever stratagem contrived to conclude an honorable peace, but had to embrace Islam. The Mosleymian "heresy" was thus stamped out, and only a few scattered remnants of the new faith

contrived to escape to Hasa and Basrah, where they may have laid the foundation of the later Karmathian creed.

It is extremely difficult to come to any clear notion of Mosaylima's real doctrines, as all the accounts that have survived of them come from victorious adversaries—adversaries who have not hesitated to invent the most scandalous stories about him. Thus, a love-adventure between Mosaylima and the prophetess Sajâh, the wife of a soothsayer of Yamâma, who is supposed to have stayed three days in his tent, is told with great minuteness, even to the obscene conversation that is supposed to have taken place between them during that time; the fact being that this story, which is still told with much relish by the natives, is without the slightest foundation. From the same source, we learn that Mosaylima tried to deceive his followers by conjuring-tricks. It seems, on the contrary, that Mosaylima was of much higher moral standing than Mohammed himself. Thus, he is said to have enjoined the highest chastity even among married people: unless there was hope of begetting children, there should be restriction of conjugal duty. Even the nickname, "Little Moslem," given to him seems to indicate that he, too, preached the unity of God, or Islam, as the fundamental doctrine of faith. How far his religion had a socialist tendency, and offered less show of dignity and outward morality to its followers, or whether it rejected fatalism, contained an idea of incarnation, and invested its preachers and teachers with a semi-mediatorial character, as the latest explorer of the Nedjed, Mr. Palgrave, tells us we have no means of judging. But we must receive these conclusions, probably drawn from the information of the natives, with all the greater caution, as that story of the prophetess Sajâh, whom he reports, after his informants, not only to have been properly married to Mosaylima, but to have, after his death, become a devout partisan of Islam, and to have entered an "orthodox alliance," does not, as we said before, deserve the slightest credence.

MOSBY, John Singleton, b. Edgemont, Va., 1833. He practised law at Bristol, Va., until the civil war, when he entered the confederate service as a private. He made a name as a scout and a guerrilla, and became col. of the Partisan battalion, famous for its guerilla raids. After the war he became a warm personal friend of Gen. Grant, and was U. S. consul at Hong Kong, 1878–85. He published *War Reminiscences* (1887), and is the subject of several memoirs.

MOSCHELES, Ignaz, 1794–1870, b. Prague; studied music under Dionysius Weber at the Prague conservatory, and at the age of 11 was the best pianist in Prague, and had begun to compose. In 1808, he went to Vienna, where he met Beethoven and Haydn, and took lessons from Albrechtsberger, who had been Beethoven's teacher. He soon won a reputation in concert, and disputed with Hummel the honor of being the first pianoforte player in Germany. After a tour of Germany, Holland, and France, he visited England, which was his residence till 1846. From 1825, he was professor in the London academy and conductor of the philharmonic concerts. The music of Beethoven was almost unknown in England at that time; and Moscheles, by his rendering of the sonatas and concertos of that composer, made the pianoforte a fashionable instrument. He was the most successful teacher, in his day, in England; but many later pianists, as most notably, Liszt and Thalberg, have surpassed him in execution. In 1846 he became professor at the conservatory at Leipsic. His own compositions are additions to classical music, and his compositions for other instruments than the piano show a profound theoretical knowledge. He published with notes, an English translation of Schindler's *Life of Beethoven.*

MOSCHI, a people of Asia living s. of the Caucasus. According to Pliny they dwelt around the sources of the Phasis, between the Euxine and Caspian seas. At the time of Augustus their territory is said to have been divided between Colchis, Armenia, and Iberia; and from them a mountain range extending from the Caucasus to the Anti-Taurus was called the Moschic mountains. Their name by early writers is often coupled with that of the Tibareni, and the two people are generally identified with the Meshech and Tubal of Scripture.

MOSCH'IDÆ, or (recently) Mosch'inæ. See Musk deer.

MOS'CHUS, a bucolic poet who lived in Greece in the 3d c. B.C., and whose writings are classed with those of Bion who was his master. The two writers are published together in a translation in Bohn's *Classical Library.* He wrote in the Doric dialect, and all his works that have been preserved are fragmentary, idyllic, and pastoral in character, but much admired by scholars.

MOSCOW, an important government of Central Russia, lies s. of the governments of Tver and Vladimir. Area, 12,859 sq.m.; pop. '93, 2,336,187. The surface is level with the exception of a tract in the s.w., which is elevated. It is watered by the Moskva and the Kliazma, while the Oka forms a portion of its southern boundary. The soil, principally clayey, with some sandy and stony tracts, is, on the whole, unfertile, and barely supplies local consumption. Few of the governments of Russia, however, equal that of Moscow in manufactures and general industry. In contains numerous cloth, silk, brocade, chintz, paper, and other factories. China-ware is manufactured from the clay dug up in the district of Gjelsk. Many of its villages carry on special branches of manufacture, of which pins, glass beads, and small looking-glasses for Asia is one. White limestone is quarried, and is much used for building in the capital.

MOSCOW (Russ. *Moskwá*), the ancient capital of Russia, and formerly the residence of the czars, is situated in a highly-cultivated and fertile district on the Moskva, 400 m. se. of St. Petersburg, with which it is in direct communication by railway. Lat. 55° 45′ n., long. 37° 37′ east. Pop. '97, 988,610. Previously to its being burned in 1812, Moscow was perhaps the most irregularly built city in Europe, and that distinction to a great extent it still retains; for, as the main object in 1813 was to build speedily, the streets rose again on the old model, undulating and crooked, and consisting of alternating houses, the most varied in character and pretensions. Many improvements have, however, been recently accomplished in the city. Gas pipes have been laid along the streets; letter-boxes are placed at frequent intervals; the Romanzoff Place, formerly so dirty, has been converted into a splendid square, with an ornamental garden, and the old obelisk, the former monument of the place, standing in the center, with water fountains on each side. The general view of the town, especially that obtained from an eminence on its southern side called the Sparrow Hills, is eminently original and picturesque. Its hundreds of churches and convents, surmounted by gilt and variously-colored domes; its gardens and boulevards; and, above all, the high walls and crowded yet stately towers of the Kreml or citadel, produce a most striking effect. The Kreml, situated on the northern bank of the river, forms the center of the town, and around it, with a radius of about a mile, is a line of boulevards, extending, however, only on the n. side of the river. Outside of this line, and concentric with it, is another line of boulevards, with a radius of a mile and a half; while beyond all, and forming the girdle of the city, is the outer rampart, with a circumference of 26 English miles. The Kreml comprises the principal buildings, as the cathedral of the Assumption of the Virgin, founded in 1326, a small but gorgeously-decorated edifice; the Cathedral of the Archangel Michael, containing the tombs of all the czars down to the time of Peter the Great, who changed the royal burial-place to St. Petersburg; the church of the Annunciation, the floor of which is paved with jaspers, agates, and carnelians of various shapes; the tower of Ivan Veliki 200 ft. in height, and surmounted by a magnificent gilded dome, from which, as from all the domes of Moscow, rises the "honorable cross;" the Czar Kolokol (king of bells), the greatest bell in the world; several palaces, and collections of ancient arms and other antiquities; the arsenal, surrounded by the splendid trophy of 850 cannons, taken from the French; and the senate. The walls of the Kreml are surmounted by 18 towers, and pierced with 5 gates. In the town, the chief buildings are the cathedral of St. Vassili, remarkable for its peculiar architecture; the Gostinoi Dvor, or bazaar; and the exchanges. The temple of the Savior, which was commenced in 1812, to perpetuate the memory of the repulse of the French invasion, was finished in 1881. The leading educational institution is the university, the first in Russia, founded in 1753. It has four faculties, namely: historical philological, juristical, physical mathematical, and medical, and in 1891 was attended by 3,888 students. Besides this there are numerous gymnasia and *real* schools, elementary and district schools, a musical conservatory, and various other institutions for special or technical instruction. There are large and numerous charitable establishments, among them an extensive orphan asylum. There are several learned societies in Moscow, which is also the seat of a Greek Metropolitan, one of the three highest dignitaries of the Russian church. Among the museums of Moscow there are, besides the various scientific cabinets of the university, the public museum removed from St. Petersburg to Moscow in 1861, and having a library, an art gallery, and a collection of antiquities, minerals, and articles of ethnological interest; the Tretjavok gallery, with a fine collection of modern Russian paintings; the historical museum and the museum of art and industry.

M. is admirably provided with means of communication, both by land and water. The Moskva opens traffic to the Caspian and Baltic seas, and railways branch out in six directions, connecting the city with St. Petersburg, Jaroslav, Nijni Novgorod, Kazan, Kursk and Brest-Litovsk. It is the seat of extensive manufacturing industries, second in importance to St. Petersburg alone. Among the articles of manufacture are textiles, silk, machinery, leather goods, metals, and tobacco. It is the chief seat of Russia in respect to domestic commerce, and its foreign commerce is also of great importance. From the central grain-producing lands of Russia it draws large supplies and it receives metals from the Ural mountains, furs from Siberia, wooden articles from the north, beef and hides from the east, and wool from the south. From China it imports tea, from Bokhara and the Baltic ports it obtains large quantities of cotton and from the Caucasus and Persia it obtains silk and dye stuffs. It derives a large part of its manufactured articles from the northern governments of the Volga and from St. Petersburg.

Moscow is of ancient origin for a Russian town. Its site was bought by Yuri Dolgoruki, in the 12th c., and a fortress built. In the 14th c. not only had it become the capital of the Russian religious world, owing to the residence there of the metropolitan, but it had also become the actual capital of Muscovy. In 1368, 1370, and 1372, it suffered from the inroads of the Lithuanians; in 1381 it was sacked by the Tartars. From 1415 to 1501 it was, on four separate occasions, partially destroyed by fires; and it was burned to the ground by Devlet-Girey, khan of the Crimean Tartars, in 1571. It was taken by the Poles in 1610, and remained in their possession till their expulsion by the Russians under Minin and Pojarsky in 1612. In 1682, 1689, and 1698, it was the theater of the revolts of the Strelitz. In 1812, from Sept. 14 till Oct. 24, it was in the hands of the French.

Its growth within the past few years has been extremely rapid. Though the newer parts have added boulevards, wide avenues, parks, and stately architecture to the attractions of the old city, it is the picturesqueness of the Kremlin, its aggregation of old and new palaces, its fortified walls and lofty towers, its churches, mosques, monasteries, domes, spires, and minarets, forming from a distance perhaps the most remarkable architectural scene in the world, that is still the greatest attraction of Moscow, and is even heightened in its effects by contrast with the old narrow and tortuous streets, their mingled poverty and magnificence, with the open, airy, and polished beauty of the new.

MOSELEY, Henry, D.D., 1802–72; b. England; educated at Cambridge. He was for a number of years professor of natural philosphy and astronomy in King's college, London. He had already taken holy orders, and in 1853 was appointed canon of Bristol cathedral. He was afterwards presented to the living of Olveston, and made chaplain to the queen. He was a member of the school-board for many years. He published a number of scientific books, including a *Treatise on Mechanics Applied to the Arts*, and *Mechanical Principles of Engineering and Architecture.*

MOSELLE (Ger. *Mosel*), an affluent of the Rhine, rises in the Vosges mountains, France, at an elevation of 2,260 ft. above the level of the sea, not far from the sources of the Saône. Its course is north-westerly as far as Pont-à-Mousson, in the department of Meurthe, where it becomes navigable; then n. to Thionville, near the French frontier; after which it proceeds in a north-easterly direction (latterly, with many zigzag picturesque windings) through Luxemburg and Rhenish Prussia, joining the Rhine at Coblentz. On its way it passes the towns of Remiremont, Epinal, Toul, Pont-à-Mousson, Metz, Thionville, and Treves. From Metz to Treves it flows through a broad valley, inclosed by rounded vine-bearing hills. Its entire length is about 320 miles. Its principal tributaries are the Meurthe, the Seille, and the Sarr on the right, and the Us, the Sauer, and the Kyll on the left. The wines grown in the basin of the Moselle are noted for their lightness and their delicate aromatic flavor. The inferior kinds are liable to acidity.

MOSELLE was formerly a frontier department in the n.e. of France, but the greater part of it was taken by Germany after the war of 1870–71. The small portion left to France was joined to the department of Meurthe Population of Moselle in 1866, 452,157. It is watered by the Moselle and its tributaries; is richly wooded, and yields abundance of grain, fruits, and wine, though the last is of an inferior quality. Agriculture is in an advanced condition; roads are numerous, and the river navigation important. Coal, iron, and building-stone are the most valuable minerals. There are also linen, woolen, leather, glass, papier-mâché, and other manufactures.

MOSELLE WINES. See German Wines.

MOSENTHAL, Salomon Hermann, b. 1821, in the Prussian province of Hesse; a German dramatist, chiefly known by the dramas *Deborah* and *Sonnenwendhof*, which have been represented with success, and translated into English, Danish, Hungarian, and Italian. He d. 1877.

MOSER, George Michael, 1705–83; b. Switzerland. At an early age he went to London and became a gold-chaser. To this he at length added enamel painting, chiefly for lockets and watch-cases, and won the notice and commendation of sir Joshua Reynolds. He was one of the founders and first keepers of the Royal Academy, in which last capacity he was superintendent of the students in drawing from the antique.

MOSER, Johann Jakob, 1701–85; b. Germany; made professor extraordinary of law at the university of Tübingen in 1720. Six years later he became councilor at Stuttgart, and in 1727 he became ordinary professor of law at Tübingen. He resigned this chair on account of a quarrel with his colleagues, and for the same cause left the directorship of the university at Frankfort-on-the-Oder. He was engaged for many years in the preparation of his most important work, on the *Public Law of Germany*, and other legal books. He afterwards opened an academy in Hanover, where the sons of the nobility were taught public affairs.

MO'SES (Heb. *Môsheh;* LXX. and Vulg. *Moyses;* ? Egypt. *Mes* or *Messou;* Copt. *Mo-ushe*, i.e., drawn out of the water), prophet and legislator of the Israelites, born about 1600 B.C. in Egypt (? Heliopolis), during the period of their hard bondage. His father was Amram, his mother Jochebed, both of the tribe of Levi. The tale of his birth and early education has, by tradition (Manetho, Philo, Josephus, Midrash, etc.), received a much more extraordinary legendary character than is found in Exodus; while the main features are, on the whole, the same in them all. And there is no reason to doubt the truthfulness of an account which shows us Moses, like many other supreme benefactors and "suns" of mankind, struggling against an apparently adverse fate, nay for very life, from the instant of his birth. The well-known narrative, to which late traditions (contained in Philo, Josephus, the Fathers, etc.) have supplied questionable names and dates, is that Moses's mother, unable to hide the child—which was to have been drowned at its birth—longer than for the space of three months, put it into a basket of papyrus, and hid it among the Nile rushes, Miriam, his sister, watching it from afar. The king's daughter (Thermuthis, or Merris?), coming down to the river, observed the weeping child, and was so struck with its beauty that she allowed Miriam to fetch a Hebrew nurse, Joche-

bed. Grown up, he was sent to the king's palace (Heliopolis) as the adopted son of the princess, and here seems to have enjoyed not only princely rank, but also a princely education. He is also said to have become a priest, under the name of Osarsiph or Tisithen, and to have been a mighty adept in all the sciences of "Egypt, Assyria, and Chaldea;" to have led Egyptian armies against the Ethiopians, defeated them, and pursued them to their stronghold, Saba (Meroe); this place being delivered into his hands by Tharbis, the king's daughter, whom he subsequently married. The Bible contains nothing whatever about the time of his youth. He first reappears there as the avenger of a Hebrew slave, ill-treated by an Egyptian overseer. Threatened by the discovery of this bloody act, he escapes into Midian, where he is hospitably received by Jethro, the priest, and married his daughter, Zipporah. He stayed for many years in Midian, tending the flocks of his father-in-law. This most sudden transition from the brilliant and refined life of an Egyptian court, of which he had been brought up a prince, to the state of a poor, proscribed, exiled shepherd, together with the influences of the vast desert around him, must in Moses's mind have produced a singular revolution. The two names which he gave to his sons, strikingly express part of what filled his soul—a feeling of gratitude for his salvation from the avenging hand of justice, and the deep woe of his exile. The fate of his brethren went now to his heart with greater force than when he was a prince and near them. There rushed upon his memory the ancient traditions of his family, the promises of Jehovah to the mighty sheikhs, his forefathers, that they should become a great and a free nation, and possess the ancient heritage of Canaan; why should not he be the instrument to carry out this promise? The *Ehye asher Ehye* (I am that I am) appeared to him while his mind was occupied with such thoughts, and himself put the office upon his shoulders. A new king had succeeded in Egypt, his old enemies were either dead or had forgotten him, and Moses returned to Egypt. Together with Aaron, his brother, the man of small energy but of fine tongue, he consulted about the first steps to be taken with the king as well as with their own people—both of whom treated them at first with suspicion, nay, with contempt.

After ten distinct plagues (more or less akin to natural phenomena peculiar to Egypt), the last being the death of all the firstborn, Pharaoh consented to let his slaves go free, "that they might serve their God." Moses very soon had occasion to prove that he was not only the God-inspired liberator of his people, who in the enthusiasm of the moment had braved the great king and his disciplined armies, but that he possessed all those rarer qualities which alone could enable a man to mold half-brutalized hordes of slaves into a great nation. Calmness, disinterestedness, patience, perseverance, meekness, coupled with keen energy, rapidity of action, unfailing courage—"wisdom in council and boldness in war"—constituted the immense power which he held over the hundreds of thousands who knew no law in their newly-acquired liberty, and who were apt to mur mur and to rebel on any or no provocation. Nor were the hostile Bedouin tribes, whose territories the new emigrants approached, easily overcome with untrained warriors, such as formed the ranks of Moses's army. The jealousy of certain elders fostering seditions within, added to his unceasing vexations; and to fill the measure to overflowing, indeed, his own brother Aaron, whom he had made his representative during his temporary absence on the Mount of Sinai, himself assisted in the fabrication of an idol. His sacred office as legislator he in reality first assumed in the third month after the Exodus, when, after many hard and trying marches and counter-marches—from Goshen to Succoth (? Latopolis, the present old Cairo); thence, by a *detour*, to Etham (? Ramlieh), Pi-hachiroth (? Bedea), through the Red sea, to the desert of Shur (? Al-Djofar), Marah, Elim (Wadi Gharandel), desert of Sin (Wadi Mocatteb, or Wadi Al-Sheikh), Dophka, Alus, Raphidim (near the Makkad Sidna Mousa)—made more trying by want of food and of water, by encounters with Pharaoh and the Amalekites, having arrived near the Mount of Sinai, he made the people encamp all round, and ascended the summit of the mountain by himself. On the incidents connected with the "revelation" made to the whole people, we need not dwell any more than on any other part of this well-known narrative. Suffice it to point out briefly, that the tendency of the whole law was to make the Hebrews a people "consecrated to the Lord," "a holy people, and a kingdom of priests," i.e., a people of equals both before God and the law. Three distinct parts compose this Mosaic constitution. The doctrine with respect to God and his attributes; the "symbolical" law, as the outward token of his doctrine, and the moral and social law. The Decalogue forms a kind of summary of all the three: the existence of Jehovah as the Absolute Being, the liberation of the people and the prohibition of polytheism, and the representation of the divinity by visible images (i.—iii). While the institution of the Sabbath, the symbol of creation and the Creator, forms the basis of all religious observances (iv.), the remaining part of the laws relate to the intercourse among the members of the human commonwealth; the gratitude of children is inculcated; murder, adultery, theft, false witness, coveting of others' goods are prohibited. The groundwork of these regulations had, indeed, been a special inheritance in the family of the Abrahamites from the earliest times; but the vicissitudes of fortune, the various migrations, and the enormous increase of this family, and its being mixed up for long years with the surrounding idolaters, had obliterated nearly all traces of the primeval purity of creed in the populace. The wisdom displayed even in the minor regulations of the Mosaic dispensation, with respect to their adaptation to the peculiarity

of the race, the climate, the political state of the country which they were to inhabit; in the hygienic regulations, and the rules which treat of the social and domestic relations; and, above all, the constantly-reiterated caution from mixing again with other nations, such as they found them in Canaan—and the neglect of which subsequently proved their ruin—is traced to a direct influence of Jehovah, generally indicated by the words, "And God spake to Moses, speak unto the children of Israel." An ample ritual, in connection with the tabernacle, or constantly-visible symbol of a divine dwelling; the allegory of an ever-new covenant represented by sacrifices, prayers, purifications, kept the supreme task of being priests and a holy people unceasingly before the eyes of the nation. The tribe of Levi (q.v.) to a certain degree acted in this respect as permanent representatives; and not to Moses's sons, but to his brother Aaron and his descendants, was intrusted the office of high-priest.

When on the eve of entering into the promised land, the people broke out in open rebellion, and threatened, by a spontaneous return to the land of slavery, to undo the entire work of Moses's life. Convinced that they were not as yet fit to form a commonwealth of their own, the liberator and lawgiver had to postpone, for the long space of 40 years, the crowning act of his work; and, in fact, did not himself live to see them taking possession of the hallowed territory. How these years of nomadic journeying through the desert (El-Tyh or Al-Tyh Beni-Israel) were spent, save in rearing up a new generation of a more manly and brave, as well as more "civilized" stamp, we can only conjecture. All those who had left Egypt as men were doomed to die in the desert, either by a natural death, or by being suddenly "cut off," in consequence of their openly defying Moses, and through Moses Jehovah. The apparent lack of incidents during this period has indeed furnished grounds for various speculations on this subject, and critics have tried to reduce it to a much shorter space, without, however, being able to prove their point. Even Goethe, with more ingenuity than knowledge of the subject, has endeavored to prove the "forty" to be a mythical round number, the real time being two years. The testimonies of the Hebrew prophets and historians, however, are perfectly unanimous on the subject (cf. Jos. v. 6; xiv. 10; Amos, ii. 10; v. 26; Ps. xcv. 10, etc.) and modern criticism has mostly endorsed the number as in keeping with the circumstances. On the first month of the fortieth year after the exodus, we find Moses at the head of an entirely new generation of Hebrews at Kadesh, in the desert of Phoran or Zin. Here his sister Miriam died. Here also, for the first time, Moses seeing the new generation as stubborn and "hard-necked" as their fathers, is recorded to have despaired of the Divine Providence; and his disobedience to the letter of the command given to him, "to speak to the rock," is alleged as the reason "that his bones too had to fall in the desert." His brother Aaron died at Hor (near Petra, according to Josephus and St. Jerome), whither the Israelites had gone next. Not long afterwards, Moses once more had occasion to punish with relentless severity the idolatrous tendencies of the people (Baal Peor), thus showing that age had had no power of making him relax his strong rule over the still half-savage and sensuous multitude. Having finally fixed the limits of the land to be conquered, and given the most explicit orders to Joshua, to Eliezer, and the chiefs of the ten tribes, respecting its division, he prepared the people for his own impending death. He recalled to their minds in the most impressive language, their miraculous liberation, and no less miraculous preservation in the desert. Their happiness—their life—was bound up, he told them, in the divine law, communicated through him by Jehovah. A recapitulation of its principal ordinances, with their several modifications and additions, and reiterated exhortations to piety and virtue, form the contents of his last speeches, which close with one of the grandest poetical hymns. The law was then handed over to the priests that they might instruct the people in it henceforth; Joshua was installed as successor (while his own sons sunk into the obscurity of ordinary Levites), and he blessed the whole people. He then ascended the mount of Nebo, from whence he cast a first and last look upon the land for which he had pined all his life, and on which his feet were never to tread. He died upon this mountain, 120 years old, in the full vigor of manhood, according to the Scriptures, "and no man knew his burial-place up to this day"—so that neither his remains nor his tomb were desecrated by "Divine honors" being superstitiously paid to them.

This is a summary of Moses's life as derived from biblical as well as non-biblical sources. The latter—except, perhaps the very doubtful traditions of Manetho—belong, whatever may be the date of the respective documents of the Pentateuch, to a much later age, and bear the air of tradition and legend, grown out of those very documents, so plainly on their face, that they are of about the same importance for historical purposes as the cycle of Midrash-sagas that have gathered around Moses, and which are reproduced variously in Moslem legendaries. On his office as a "prophet:"—what was the special nature of his revelations, how far the doctrines promulgated by him were traditional among the Abrahamites, and how much of his laws is due to Egyptian influences; whether part of them was first inaugurated by later generations and ascribed to him, or whether others were never carried out at all: on these and similar questions which have been abundantly raised, more especially in recent times, we must refer for fuller information to the special works on the subject. Some notices of the more important points will be found under GENESIS, JEWS, PENTATEUCH, DECALOGUE, etc. There seems, however, but one conclusion. The brief span of human history of which we

have any knowledge, shows few, if any, men of Moses's towering grandeur—even with all the deductions that the most daring criticism has yet proposed.

MOSHEIM, Johann Lorenz von, a distinguished church historian of Germany, was b. at Lübeck, Germany, Oct. 9, 1694, and studied at Kiel. In 1723 he became ordinary professor of theology at Helmstedt, from which he was removed in 1747 to a similar office in Göttingen. He died chancellor of the university of Göttingen, Sept. 9, 1755. His theological works are numerous, amongst which are a work on Bible morality, *Sittenlehre der Heiligen Schrift* (new ed. continued by J. P. Miller, 9 vols. Helmst. 1770–78); and discourses, *Heiligen Reden* (3 vols. Hamb. 1732, et seq.). But his most important contributions to theological literature are in the department of ecclesiastical history, in which his *Institutiones Historiæ Eccleiasticæ* (Helmst. 1755) is familiar to every student as a work of great learning, fullness, and accuracy. It has been translated from the original very elegant Latin into English and other languages. The best English translation is that by Dr. James Murdock (3 vols. New York, 1832), of which there are many reprints. Besides this, Mosheim is the author of *Institutiones Historiæ Christianæ Majores* (Helmst. 1763); *De Rebus Christianorum ante Constantinum Commentarii* (Helmst. 1753): *Dissertationes ad Hist. Ecclesiasticam pertinentes* (2 vols. new ed. Altona, 1767); and *Versuch einer unparteiischen Ketzergeschichte* (2 vols. Helmst. 1746–48). His stand-point is that of liberal orthodoxy: yet he is essentially *dogmatic*, and pays more regard to the mere "opinions" of men than to the character and genius shining through them; hence, his *Church History* is far inferior in point of richness, depth, and suggestiveness to that of Neander.

MOSKVA, a river of European Russia, a branch of the Oka, which is itself a branch of the Volga. It is celebrated in history for the great battle, called the battle of Borodino (q.v.), fought on its banks, Sept. 7, 1812, from which Ney (q.v.) obtained his title Prince of Moskva. The Moskva rises in a marsh in the government of Smolensk, passes close by the towns of Moshaïsk and Svenigrod, passes through the city of Moscow, and joins the Oka near Kolomna, in the government of Moscow. The whole length of its course is about 290 miles. A considerable commerce is carried on by boats on the Moskva, and it is directly connected with the Volga by the *Moskva Canal.*

MOSLEM. See Mussulman; Mohammedanism.

MOSOSAU'RUS, Meuse Lizard, a genus of huge marine lizards, whose remains occur in rocks of cretaceous age. Three species are known, one from the upper chalk of Sussex, a second from the cretaceous beds of North America, and the third from the Maestricht beds. This last (*M. Hofmanii*) was first known from a nearly perfect head dug out of St. Peter's Mount in 1780, and popularly called the great animal of Maestricht. Originally the property of Hofman, it was taken from him, in virtue of some clause in their charter, by the ecclesiastical authorities of Maestricht, who, in their turn, were compelled to give it up to the victorious French army, and by them it was removed to Paris. It is said that the French cannoniers, when preparing for the siege, had instructions not to point the artillery toward that part of the town in which the precious specimen was deposited. This head is 4 ft. in length, and the animal to which it belonged is estimated to have been 25 ft. long. The total number of the vertebræ was 133: they were concave in front and convex behind, and were fitted to each other by a ball-and-socket joint, admitting of easy and universal flexion; the sacrum seems to have been wanting. The limbs were developed into four large paddles, and these with the comparatively short and strong tail, the bones of which were constructed to give great muscular power, enabled the animal to move quickly through the water in pursuit of its prey. The jaws were furnished with a single row of strong conical teeth. Cuvier first showed the affinities of the animal. It is most nearly related to the modern monitor, but differs from all modern lizards in its peculiar adaptations for an ocean life, and in its great size. The largest living lacertian is only 5 ft. in length, and of this a large proportion is made up by the tail; the Mososaurus, with its short tail, is estimated to have been at least 25 ft. long.

MOSQUE, a Mohammedan house of prayer. The word is derived, through the Italian *moschea*, from the Arabic *mesjid*, a place of prayer. The form of the oldest mosques (at Jerusalem and Cairo) is evidently derived from that of the Christian basilica, the narthex being the origin of the court, with its arcade, and the eastern apses representing the principal buildings of the mosque facing Mecca. The original forms became, however, entirely obliterated in the progress of Mohammedan architecture, and the mosques, with their arcaded courts, gateways, domes, and minarets, became the most characteristic edifices of Saracenic art. Wherever the Mohammedan faith prevailed, from Spain to India, beautiful examples of these buildings exist. They vary considerably in style in different countries, the Saracens generally borrowing much from the architecture of the various nations who adopted their faith. In India, the mosques have many features in common with the temples of the Jains, while in Turkey they resemble the Byzantine architecture of Constantinople. Everywhere the dome is one of the leading and most beautiful features of the mosques, which commonly consist of porticoes surrounding an open square, in the center of which is a tank or fountain for ablution. Arabesques and sentences of the Koran inscribed upon the walls, which are

generally white-washed, and never bear any device representing a living thing, are the only ornaments of the interior. The floor is generally covered with mats or carpets; there are no seats. In the s.e is a kind of pulpit (Mimbar) for the imám; and in the direction in which Mecca lies (the Kibleh), there is a niche (Mehrab) toward which the faithful are required to look when they pray. Opposite the pulpit, there is generally a platform (Dikkeh), surrounded by a parapet, with a desk bearing the Koran, from which portions are read to the congregation. The five daily prayers (see MOHAMMEDANISM), which are generally said at home—especially by the better classes—on week-days, are said in the mosque by the whole congregation on Fridays, the days of Al-Gumah, or the assembly, the Moslem Sundays, together with some additional prayers, and at times a sermon is superadded to the service. It is not customary for women to visit the mosques, and if they do, they are separated from the male worshipers. The utmost solemnity and decorum are preserved during the service, although in the hours of the afternoon (when there is no worship) people are seen lounging, chatting, even engaged in their trade, in the interior of the sacred building. On entering the mosque, the Moslem takes off his shoes, carries them in his left hand, sole to sole, and putting his right foot first over the threshold, he then performs the necessary ablutions, and finishes by putting his shoes and any arms he may have with him upon the matting before him. The congregation generally arrange themselves in rows parallel to that side of the mosque in which is the niche, and facing that side. The chief officer of a mosque is the nazir, under whom are two imáms, a kind of religious official, in no way to be compared with what we understand by a clergymen of a creed, but who performs a certain number of religious rites, as long as the nazir allows him to do so, and who, being very badly remunerated, generally has to find some other occupation besides. There are further many persons attached to a mosque in a lower capacity, as mueddins (q.v.), bowwabs (door-keepers), etc., all of whom are paid, not by the contributions levied upon the people, but from the funds of the mosque itself. The revenues of mosques are derived from lands. With many of the larger mosques, there are schools, academies (medressehs), and hospitals connected, and public kitchens, in which food is prepared for the poor.

MOSQUÉRA, RUY GARCIA, 1501–55, b. Spain, a navigator who accompanied Sebastian Cabot to South America in 1526, where nine years later he joined Pedro de Mendoza in founding Buenos Ayres. His descendants for three hundred years have been prominent and influential in Colombia.

MOSQUI'TO (Span. *gnat*), a name very generally given to the most troublesome species of *culex*, and allied genera. See GNAT. The name mosquito is given, according to Humboldt, in some parts of tropical South America to species of *simulia*, which are active during the day, whilst species of *culex*, active chiefly during the night, are called *zancudoes;* but these latter are the mosquitoes of other countries generally. The name was probably first used in the West Indies, where it particularly designates a species (*C. mosquito*) very similar to the common gnat, but not quite so large, with black proboscis, and marked with silvery white on the head, thorax, and abdomen. It abounds in the warm parts of America, especially in marshy districts and in the vicinity of stagnant waters. It and similar species extend even to very northern regions, appearing during the heat of summer in prodigious swarms. Similar species are found also in similar situations in almost all parts of the world, and are almost as great a pest in Lapland as within the tropics. The bite which they inflict is painful, and their incessant sharp buzzing prevents sleep. In India and other countries, beds are provided with *mosquito curtains* of gauze, which are closely drawn, to protect the occupant, while the natives who cannot avail themselves of such protection, smear their bodies with oil. So numerous are mosquitoes in some localties in South America, that the wretched inhabitants sleep with their bodies covered over with sand three and four inches deep, the head only being left out, which they cover with a handkerchief; and travelers have been obliged to have recourse to the same expedient. Even thick clothes afford at best a very partial protection from mosquitoes, being readily penetrated by the proboscis. Mosquitoes are readily attracted to a lamp, and perish in its flame; but where they are numerous, a lamp only causes additional swarms to congregate to its neighborhood until it is extinguished, as is often very soon the case, by their dead bodies.

MOSQUITO COAST, MOSQUITO TERRITORY, or MOSQUITIA, formerly a native kingdom, under the protectorate of Britain, lies on the e. coast of Central America, having Honduras on the n., Nicaragua on the w., and Costa Rica on the south. The area is estimated at 15,000 English sq.m., but as 20,000 m. of contested territory lie between it, and Honduras and Nicaragua, its extent would be more correctly given at 25,000 sq. miles. The coast is low, with many bays and lagunes, and possesses a number of good harbors. The two principal rivers are the Rio de Segovia (which rises within 35 m. of the Pacific ocean), and the Rio Escondido, both of which flow into the Caribbean sea. The climate is rainy, and the temperature, considering the latitude, is cool and equal, the thermometer seldom rising above 82° or falling below 71°. On the whole, this territory is one of the most healthy parts of Central America. Ague is not unusually common, epidemics are exceedingly rare, and white people who do not recklessly expose themselves enjoy the best health. The swampy grounds are generally covered with

dense forests, in which dye-woods and timber-trees of great value abound. Rice, maize, manioc, and other tropical plants, are cultivated. The country abounds in deer of various kinds, half-wild horses and oxen roam in the savannas, which are covered with tall grass, and alligators and serpents are common. The chief exports are mahogany, cocoa, ginger, sarsaparilla, and tortoise-shell, but the whole trade is inconsiderable.

The Mosquito Coast was discovered in 1502 by Columbus, and though never conquered, was claimed by Spain till about 1660, when the king, with consent of his people, placed himself under the protection of Britain. British colonists at different times attempted to found settlements in various parts of the country, but from various causes were soon after compelled to withdraw. Of late years they have met with more success. The foothold Britain thus obtained in Central America was viewed with great jealousy by the United States, who left no means untried to effect her expulsion. During the British protectorate a sort of constitutional government was established, consisting of a legislative body, and regular jury courts. In July, 1850, the United States and Great Britain bound themselves by the Clayton-Bulwer treaty "not to occupy, fortify, colonize, or exercise dominion over the Mosquito Coast, or any part of Central America;" and in November, 1859, Britain ceded the protectorate of Mosquito Coast along with the Bay Islands to Honduras, a proceeding which gave rise to much discontent among the natives of the coast, and a complete rebellion of the islanders. After this the natives enjoyed self-government, for, on account of a vague and undefined authority which England claimed to have over the Mosquito coast, Nicaragua was afraid to claim it. In 1894, however, the Nicaraguans grew bolder, and advancing, claimed possession, and on Nov. 20 of that year the Mosquito coast was incorporated as a province of Nicaragua, under the name of the department of Zeloya. Its population in 1894 was about 15,000.

MOSS-AGATE. See Mocha Stone.

MOSS-BUNKER, or Bony Fish. See Menhaden.

MOSSES, *Musci*, an order of acotyledonous plants, consisting of mere cellular tissue without vessels, and distinguished from *Hepaticæ* (q.v.), the order with which they are most nearly allied, by having always a leafy stem, and an operculated capsule or urn (*sporangium* or *theca*), which opens at the top, and is filled with spores arranged around a central column (*columella*). The capsule is covered by a hood (*calyptra*); and when it is ripe, and has thrown off the calyptra and operculum, exhibits around its mouth a single or double row of rigid processes, few or numerous, but always either four or a multiple of four, collectively called the *peristome*. These reproductive organs are viewed by many botanists as female flowers or *pistillidia*; whilst reproductive organs of another kind, sometimes found on the same plant, but more generally on distinct plants, are regarded as male flowers or *antheridia*. These are minute cylindrical sacs, occurring in the axils of the leaves, or collected into a head inclosed by variously modified leaves at the summit of the stem, and finally bursting and discharging a great number of spherical or oval vesicles, through the transparent walls of which, when moistened with water, filaments (*spermatozoids*) coiled up within them may be seen wheeling rapidly round and round. As the sacs merely discharge these vesicles and perish, it is supposed that the spermatozoids contained in them may effect the fertilization of the spore-producing capsules; but this wants confirmation, and their particular office as reproductive organs is not yet fully ascertained.—None of the mosses are large plants, many are very small. Many have elongated stems, often branching; others have the stem scarcely developed, so that they seem to consist of a mere tuft of leaves. They are generally social in their manner of growth. They are among the first plants which begin to clothe the surface of rocks, sands, trunks of trees, etc., adapting inorganic matter for the support of higher kinds of vegetation. They love moisture, and are generally more abundant in cold and temperate than in hot climates. They struggle for existence on the utmost limits of vegetation in the polar regions and on mountain-tops. They dry up and appear as dead in a very dry state of the atmosphere, but revive when moisture returns. Some of them grow in bogs, which they gradually fill up and consolidate. They are of great use in protecting the roots of many plants from cold and from drought, and afford harbor to multitudes of insects. Some of them supply food for cattle, particularly for the reindeer, when nothing better is to be obtained, and a wretched kind of bread is even made by some of the dwellers in the Arctic regions, of species of *Sphagnum*. Some are astringent and diuretic, but their medicinal virtues are unimportant. Among the other principal uses to which they are applied by man are the packing of things liable to be broken, the littering of cattle, the covering of garden plants in winter, and the stuffing of the open space in roofs to moderate the heat of attic rooms in summer and their cold in winter—perhaps the most important use to which they are ever put, at least in Britain, and to which, as the benefit is great and easily attained, it is wonderful that they are not much more frequently applied. The abundance of mosses in meadows and pastures is disagreeable to farmers. The best remedies are proper drainage, the application of lime, and the liberal use of other manures, by which the soil may be enriched, so that better plants may grow with sufficient luxuriance, upon which the mosses are choked and disappear.

Several thousand species of mosses are known. Many of the mosses are very beauti-

ful, and their capsules and other organs are interesting objects of study, even with an ordinary magnifying-glass.

MOSS-TROOPERS, marauding bands that inhabited the borders between Scotland and England during the last half of the 17 c., compelling the vicinage to purchase security by paying a constant rent to them. They were called moss-troopers because they dwelt in the mosses and always rode in troops. In Fuller's *Worthies of England* it is stated that, at one time, they numbered several thousands, and that their great enemies were "the laws of the land and the lord William Naworth," who finally reduced them to legal obedience. Scott mentions them in *The Lay of the Last Minstrel.*

MOST, JOHN, b. Augsburg, Bavaria, 1842; received a good common education. He is a violent Socialistic agitator; has been imprisoned in Austria, Germany, England, and the U. S. He published in London the *Freiheit*, a socialistic paper, and was there, 1881, tried and condemned to 16 months' imprisonment, upon the charge of inciting to murder. At the expiration of his term he came to the U. S., where he has made socialistic speeches in many of the cities, and been twice imprisoned for inciting to riot.

MOSTAR', a t., capital of Herzegovina (q.v.), Austria-Hungarian kingdom, on the Narenta, 47 miles s.w. of Sarajevo. It is surrounded by embattled walls, contains ten mosques, a Greek church, and a famous Roman bridge of one arch, 95 ft. in span. Silk, grapes, and wine are produced, and knife-blades and weapons are manufactured. Mostar is also a place of considerable trade. Pop. about 12,700.

MO'SUL, a t. of Asiatic Turkey, chief town of the vilayet of Mosul, is situated on the right bank of the Tigris, opposite the ruins of ancient Nineveh (q. v.), and 220 m. up the river from Bagdad. It is surrounded by walls, and is still in a more flourishing condition than most Turkish towns, on account of its caravan trade with Diarbekir, Bagdad, and Aleppo, though its prosperity is nothing to what it formerly was. During the middle ages it supplied all Europe with its rich manufactures—*muslins*, according to Marco Polo, got their name from this town, now, on the contrary, the bazars of Mosul are filled with the manufactures of the west. The principal causes of its diminished importance are the rise of Abushehr (q. v.) as an emporium of trade, and the opening up of the new sea-route to India by the isthmus of Suez. Mosul is the seat of a Jacobite patriarch, and was formerly the great metropolis of all the Mesopotamian Christians. Pop. 61,000, of which 48,000 are Mohammedans, 10,000 Christians, and 3,000 Jews.

MOTACIL'LIDÆ. See WAGTAIL.

MOTAZ'ILITES, or MUTAZALITES, a "heretical" Mohammedan sect, dating a few generations after Mohammed, of which brief mention has been made under the heading MOHAMMEDAN SECTS. Their name is derived from an Arabic word, denoting to "separate one's self," and originally applied to any special sect or union of men, but the Motazilites becoming the most important and dangerous in Islam, they received this denomination by way of eminence. They were also called Moattalites—i. e., those who divest God of his attributes—and Kadarija, i. e., "those who hold that man has a free will, and deny the strict doctrine of predestination." The first beginnings of this sect are traced to Mabad, who, in the time of Mohammed himself, already began to question predestination, by pointing out how kings carry on unjust wars, kill men, and steal their goods, and all the while pretend to be merely executing God's decrees. The real founder of the sect, as such, however, is Wasil, b. Ata. He denied God's "qualities," such as knowledge, power, will, life, as leading to, if not directly implying, polytheism. As to predestination itself, this he only allowed to exist with regard to the outward good or evil that befalls man, such as illness or recovery, death or life, but man's actions he held to be entirely in his own hands. God, he said, had given commandments to mankind, and it was not to be supposed that he had, at the same time, preordained that some should disobey these commandments, and that, further, they should be punished for it. Man alone was the agent in his good or evil actions, in his belief or unbelief, obedience or disobedience, and he is rewarded according to his deeds. These doctrines were further developed by his disciple, Abu-l-Hudail, who did not deny so absolutely God's "qualities," but modified their meaning in the manner of the Greek philosophers, viz., that every quality was also God's essence. The attributes are thus not without but within him, and so far from being a multiplicity, they merely designate the various ways of the manifestations of the Godhead. God's will he declared to be a peculiar kind of knowledge, through which God did what he foresaw to be salutary in the end. Man's freedom of action is only possibly in this world. In the next, all will be according to necessary laws immutably preordained. The righteous will enjoy everlasting bliss; and for the wicked, everlasting punishment will be decreed. Another very dangerous doctrine of his system was the assumption that, before the Koran had been revealed, man had already come to the conclusion of right and wrong. By his inner intellect, he held, everybody must and does know—even without the aid of the divinely given commandments—whether the thing he is doing be right or wrong, just or unjust, true or false. He is further supposed to have held, that unless a man be killed by violent means, his life would neither be prolonged nor shortened by "supernatural" agencies. His belief in the traditions was also by no means an absolute one.

Many were the branches of these Motazilites. There were, apart from the disciples of Abu-l-Hudail, of whom we have just spoken, the Jobbaians, who adopted Abu Ali

Al-Wahhab's (Al-Jobbâi's) opinion, to the effect, that the knowledge ascribed to God was not an "attribute;" nor was his knowledge "necessary;" nor did sin prove anything as to the belief or unbelief of him who committed it, who would anyhow be subjected to eternal punishment if he died in it, etc.—Besides these, there were the disciples of Abu Hashem—the Hashemites, who held that an infidel was not the creation of God, who could not produce evil. Another branch of the Motazilites were the disciples of Ahmed Ibn Hayet, who held that Christ was the eternal word *incarnate*, and assumed a real body; that there were two gods, or creators, one eternal, viz., the Most High God, and the other not eternal, viz., Christ—not unlike the Socinian and Arian theories on this subject; that there is a successive transmigration of the soul from one body into another, and that the last body will enjoy the reward or suffer the punishments due to each soul: and that God will be seen at the resurrection with the eyes of understanding, not of the body.

Four more divisions of this sect are mentioned, viz., the Jâhedhians, whose master's notion about the Koran was, that it was "a body that might grow into a man, and sometimes into a beast, or to have, as others put it, two faces—one human, the other that of an animal, according to the different interpretations." He further taught them, that the damned would become fire, and thus be attracted by hell; also, that the mere belief in God and the Prophet constituted a "faithful." Of rather different tendencies was Al-Mozdar, the founder of the branch of the Mozdarians. He not only held the Koran to be uncreated and eternal, but so far from denying God the power of doing evil, he declared it to be possible for God to be a liar and unjust.—Another branch was formed by the Pasharians, who, while they carried man's free agency rather to excess, yet held that God might doom even an infant to eternal punishment—all the while granting that he would be unjust in so doing.—The last of these Motazilite sectarians we shall mention are the Thamamians, who held, after their master, Thamâma, that sinners would undergo eternal damnation and punishment; that free actions have no producing author; and that, at the resurrection, all infidels, atheists, Jews, Christians, Magians, and heretics should be returned to dust. We cannot, in this place, enlarge upon the different schools founded by the Motazilites, nor upon the subsequent fate. The vast scientific development, however, which their doctrines begot, and which resulted in the encyclopædic labors called "The Treatises of the Sincere Brethren and True Friends," are touched upon under SINCERE BRETHREN (q. v.). See Weil, *Geschichte der Khalifen;* Sale's *Koran;* Steiner, *Mutaziliten;* Dieterici, *Transactions of the German Oriental Society*, etc.

MOTETT, a name applied to two different forms of musical composition—1. A sacred cantata, consisting of several unconnected movements, as a solo, trio, chorus, fugue, etc.; 2. A choral composition, generally also of a sacred character, beginning with an introduction in the form of a song, perhaps with figurative accompaniment; after which follow several fugue subjects, with their expositions, the whole ending either with the exposition of the last subject, a repetition of the introduction, or a special final subject. A motett differs in this respect from a double or triple fugue, that the subjects never appear simultaneously, but are introduced one after the other. In one form of the motett, the successive phrases of an entire chorale are treated as so many fugal subjects.

MOTH, the popular name of all the insects included in the section *Nocturna* of the order *Lepidoptera* (q.v.). They formed the genus *Phalæna* of Linnæus, but are now distributed into many genera and families, the species being extremely numerous. Among them are the very largest *Lepidoptera*, and also the smallest. They are distinguished from hawk-moths, and from most of the butterflies, by their bristle-shaped antennæ, tapering from base to apex. The antennæ are frequently feathered or pectinated, especially in the males. The proboscis is generally similar to that of butterflies; but there are some groups of moths in which it is merely rudimentary, and these are supposed to take no food after they pass from the larva state. The thorax is generally shorter and more robust than in butterflies; the tibiæ of the legs often bear a kind of spur; the wings are held either in a horizontal or in an inclined position when at rest; or, as in many of the smaller moths, are wrapped around the body. The two wings of the same side are generally hooked together in repose by means of bristles on the margin. The females of a few species are wingless.—Moths are generally nocturnal, although to this rule there are a few exceptions. They often exhibit great richness in beauty of colors, although in brightness of color they are not generally equal to butterflies. Their food is similar to that of butterflies.—They lay great numbers of eggs, which exhibit varieties of form and color as great as those of the insects themselves. Their caterpillars are more widely various in form and characters than those of the butterflies; differing from each other in the number of their legs, and in horns, protuberances, caudal appendages, hairy covering, etc. Some are social both in the larva and chrysalis state, forming, on their entering the latter state, very curious nests. The chrysalis of a moth is never angular nor furnished with protuberances, and is generally enveloped in a silken cocoon, pretty close and compact; although some moth chrysalids are found in a mere space filled with threads which cross each other in various directions. Silk-worm (q.v) moths are among the insects most useful to man; but moths in general are regarded by him as injurious, the larvæ of many feeding on leaves of various kinds, and often destroying valuable

crops; and the larvæ of some small species proving very destructive to clothes, books, etc. The largest and most splendid moths inhabit tropical countries. Some of the most interesting and important kinds of moth are noticed in separate articles. Observation of the habits and of the richness of color of moths is a favorite pursuit of naturalists. See illus., INSECTS, vol. VIII.

MOTHER CAREY'S CHICKEN, a name familiarly given by sailors to the stormy petrel and other small oceanic species of Petrel (q.v.).—The name MOTHER CAREY'S GOOSE, is in like manner, given to the great black petrel or gigantic fulmar (*Procellaria gigantea*) of the Pacific ocean; a bird of about three feet in entire length, with very long wings, and blackish gray plumage, a ravenous feeder on dead whales and all other animal garbage, and which also kills and preys upon other sea-birds.

MOTHER OF PEARL, the shells of the large bivalve mollusk *Meleagrina margaritifera*, which also produces the precious pearls. See PEARL. These shells are collected in vast numbers in the tropical seas, chiefly on the coast of Ceylon, Manilla, Cuba, Panama, and the South Sea islands. Those from Panama are small and thick, and are known in commerce as "bullock" shells; those from Manilla are finest in quality, often as much as a foot in diameter, round and flat. There are two varieties—the white or silver-lipped, and the black-lipped. So enormous is the trade in these shells, that the imports of this country alone amount to 3,000 tons per annum, the value of which is nearly £100,000. Although large quantities of these shells are consumed in inlaying fancy wood work, papier-mâché, and in making knife-handles and other small ornamental objects, by far the greater portion is required for making buttons, chiefly in Birmingham.

MOTHER OF PRESIDENTS is a name frequently given to the State of Virginia, which has furnished more presidents to the Union than any other state. The following five were elected from this state: George Washington, Thomas Jefferson, James Madison, James Monroe, and John Tyler. See STATES, POPULAR NAMES OF.

MOTHER WATER. MOTHER LYE. See LYE.

MOTHERWELL, WILLIAM, a Scottish poet and antiquary, was b. in Glasgow, Oct. 13, 1797, and educated chiefly at the grammar-school of Paisley, where, in his fifteenth year, he entered the office of the sheriff-clerk. At the age of twenty-one, he was appointed sheriff-clerk depute of the county of Renfrew. In the following year he published his first work, the *Harp of Renfrewshire*, containing biographical notices of the poets of that district, from the 16th to the 19th century. This work was but the prelude to one of far greater importance—his *Minstrelsy, Ancient and Modern*, which appeared at Glasgow in 1827. In 1828 he commenced the *Paisley Magazine*, in which some of his finest original pieces first saw the light, and in the same year accepted the editorship of the *Paisley Advertiser*, a conservative journal. In 1830 he became editor of the *Glasgow Courier*. He died in that city, Nov. 1, 1835, at the early age of 38. Motherwell displays in his best moods (but *only* then) a rich, beautiful, and strong imagination, great warmth and tenderness of feeling, and a thorough knowledge of the language of a poet. His *Jeanie Morison* is unsurpassed for the mingled pathos and picturesque beauty of its reminiscences of boyish love; *The Sword-Chant of Thorstein Raudi* is perhaps the most heroic rune in the English tongue; and the little piece beginning, "My heid is like to rend, Willie," has seldom been read without tears. An enlarged edition of his poetical remains, with a memoir, was published in London in 1849.

MOTHERWORT, *Leonurus Cardiaca*, a plant of the natural order *Labiatæ*, found about hedges and in waste places in Europe, and now abundantly naturalized in some parts of North America. It is not very common in Britain, and probably has been introduced. It is perennial, has a branched stem about three feet high, stalked leaves, the lower ones three-lobed, and crowded whorls of reddish-white flowers. The calyx has five pungent spreading teeth. The upper lip of the corolla is shaggy on the upper side, the lower lip trifid. The anthers are sprinkled with shining dots. The plant was formerly in much use as a domestic pectoral medicine, but is now comparatively little employed. It has a strong, but not agreeable smell.—Other species of the same genus are found in Europe and the n. of Asia.

MOTION, LAWS OF, are the fundamental principles connecting force and motion in the physical universe; and are obviously to be derived from *experiment* alone, since intuitive reasoning cannot possibly give us any information as to what may or may not be a law of nature. Though these laws are derived from experiment, it cannot be said that we have any very *direct* experimental proofs of their truth—our most satisfactory verifications of them are derived from the exact accordance of the results of calculation with those of observation in the case of such gigantic combinations of mutually influencing bodies as that of the solar system; and it is by such proofs that they must be considered to have been finally established.

They seem first to have been given systematically and completely by Newton, at the opening of the *Principia;* but the first two were known to Galileo, and some of the many forms of a *part* of the third were known to Hooke, Huyghens, Wren, and others. We shall give them here in order, with a few brief comments, showing their *necessity* and their *use*.

First, then, we naturally inquire, what matter would do if left to itself; and, by con-

sidering cases in which less and less external force is applied to a body, we are led to the statement called the *first law of motion:*

1. *Every body continues in its state of rest or of uniform motion in a straight line, except in so far as it may be compelled by impressed forces to change that state.*

This expresses simply the *inertia* of matter—i.e., a body cannot alter its *state* of rest or motion; for any such alteration external *force* is required. Hence the definition of force (q.v.), as that which changes or tends to change a body's state of rest or motion.

Now, how does the change of state depend on the force which produces it? This is obviously a new question, to be resolved by experiment; and the answer is the *second law of motion:*

2. *Change of motion is proportional to the impressed force, and takes place in the direction of the straight line in which the force acts.*

Newton's silence is as expressive as his speech. Nothing is here said about the previous motion of the body, or about the number of forces which may be at work simultaneously. Hence, a force produces its full effect in the form of change of motion, whether it act singularly, or be associated with others; and whatever, moreover, be the original motion of the body to which it is applied. Hence, there is no such thing as equilibrium of *forces*; every force produces motion—and what we call equilibrium is *not* the balancing of forces, but the balancing of their *effects*. Hence, the absurdity of attempting to found the science of statics on any other basis than is to be derived from the second law of motion; which, in fact, leads us at once (by the *parallelogram of velocities*, which is a purely geometrical conception) to the *parallelogram of forces*, and thence, with the help of the third law, to the whole subject of statics. The second law also supplies the means of measuring *force* and *mass;* and of solving any problem whatever concerning the motion of *one* particle.

But more is required before we can study the motion of a *system* of particles—as a rigid body, or a liquid, for instance; or a system of connected bodies. Here there are mutual actions and reactions of the nature of pressure or of transference of *energy* (see Force) between the parts—and these are regulated by the *third law of motion:*

3. *To every motion there is always an equal and contrary reaction: or, the mutual actions of any two bodies are always equal and oppositely directed in the same straight line.*

Thus, the mutual pressure between two bodies has equal, but *opposite*, values for the two. The tension of a rope is the same throughout, and tends as much to pull *back* the horse at one end as to pull *forward* the canal-boat at the other. The earth exerts as much attractive force on the sun as the sun exerts on the earth—and the same law applies to the other attractive and repulsive forces, as those of electricity and magnetism.

But Newton goes much further than this; he shows, in fact, that action and reaction (subject to the third law) may consist in *work done by a force*, instead of the mere force or pressure itself. From this form of the third law we derive at once the principle of virtual velocities (see Velocity; Work), which in its application to machines is familiar as "*What is gained in power is lost in speed.*" But we also derive the grand principle of the indestructibility of work or energy; at all events in the case of the ordinary mechanical forces—one of the grandest discoveries which science owes to Newton. It is true that he merely *mentions* it, and then abruptly passes to another subject; yet we can hardly exaggerate the value of this single remark. Experimenters, mainly Davy and Joule, have since shown that all the physical energies, as heat, light, electricity, etc., are subject in their transformations to the third law of motion, and thus the system constructed by Newton for ordinary dynamical purposes, is now found to rule the most mysterious of the affections of matter. For a development of this, see our article on Force.

MOTION, Animal. Motion or progression is that function by which an animal is able to transport itself from place to place. It is enjoyed exclusively by animals, there being nothing strictly analogous to it in the vegetable kingdom. The organs employed in locomotion are of two kinds, the *passive* and the *active;* the former including all those textures which form the skeleton, and by which its segments are united, as fibrous and areolar tissue, synovial membrane, cartilage, fibro-cartilage, and bone, while the latter includes the muscles with the nerves, which convey to them the mandates of the will.

Before proceeding to notice the different modes of progression of men and animals, it may be expedient to say a few words on *standing*, or the natural attitude of an animal. This attitude depends upon the form and functions of the limbs. Most of the terrestrial mammals and the reptiles (excepting the serpents), both of which use four feet in walking, have the backbone (the vertebral column) nearly horizontal (being only slightly concave downwards), and resting, at the same time, both on the fore and hind legs. Birds, whose anterior extremities are intended for flight, stand upon the posterior limbs only, although in their case, too, the backbone is generally nearly horizontal when the animal is at rest. Man alone stands erect with his head supported on the summit of the nearly vertical vertebral column. Some other animals (monkeys, hares, kangaroos, etc.) can rise more or less erect, but in their case the attitude is obviously not the natural one.

In standing it is requisite that the limbs should be so arranged that the center of gravity may fall within the space included by the feet. If the center of gravity does

not fall within this space the animal cannot stand, but must fall to that side to which the center of gravity inclines. On this account certain aquatic birds (the albatross, for example), which have their feet placed very far back, cannot use them for walking. If an animal has four legs, it is not necessary that they should have the broad base, which is essential in bipeds. We see that most quadrupeds have comparatively small feet, while birds are furnished with long toes, which, when spread out, form large bases of support. Moreover, the flexor muscles of the toes are so arranged that the weight of the body causes them to contract firmly, and hence birds are enabled to sleep standing without any effort.

Walking is the most common form of progression. When it is accomplished by two legs only, as in man, the body is inclined forward, carrying the center of gravity in that direction; and while one leg supports the body the other is thrown forward to prevent it from falling, and to sustain it in turn. Hence, walking has been defined to be a continual falling forward, interrupted by the projection of the leg. Those writers who have especially studied the theory of walking (Borelli, the brothers Weber, and Bishop) have divided the time of a step into two portions—i.e., that in which one leg only rests on the ground, and that in which both legs rest on the ground. The period in which both feet are on the ground is shorter than that in which the body is supported by one leg only. During the time the body is supported by one leg, the other leg swings from behind forward, without the active intervention of its muscles, but by the mere force of gravity—in short, like the pendulum of a clock. When this leg is again placed on the ground the first interval ends, and the other—i.e., that in which the body is supported by both legs—begins, and, of course, terminates with the raising of the other leg. The time that the body is supported by both legs diminishes as the velocity increases, and vanishes as the walk merges into a run; while, on the other hand, it attains its maximum in extremely slow walking, when it is found by experiment to amount to half the time in which only one leg supports the body. The greatest velocity of walking is attained when the time of a step is equal to half the duration of the motion of the swinging leg, and the velocity in walking of any given person depends on the time taken in making each step, and on the length of the steps; and both of these are, again, dependent on the height at which the center of gravity of the body or the heads of the thigh-bones are carried above the ground; for as the height of the latter diminishes, the length of the step is increased, while its time is diminished, and *vice versa*. The best walkers are incapable of acquiring a speed of more than 7 m. an hour; and even this speed cannot be kept up for any length of time. The walking of quadrupeds is a similar process to that of bipeds, except that the body always rests on at least two legs. The limbs are raised in a determinate order, and usually in such a manner that the hind-leg of one side succeeds the fore-leg of the opposite side.

Running consists of the same succession of motions as walking; but these motions are so accelerated that there is a period between two steps when the body is not supported on either leg; and this constitutes the essential difference between the two paces. It requires a far greater expenditure of muscular force than walking, and cannot be long maintained without considerable exhaustion. First-rate runners can accomplish a mile in a few seconds under four minutes and a half, and 10 m. in an hour. (Levett in a match with Frost, which came off on Mar. 22, 1852, at Copenhagen Fields, ran 10 m. 250 yds. in 52′ 53″, and Deerfoot ran 11 m. 740 yds. at Brompton in an hour). In quadrupeds there are various paces besides walking, which are known as trotting, cantering, and galloping; and as every one is familiar with the ordinary paces of the horse, we shall take that animal as our illustration. In *trotting*, the horse moves its legs in pairs diagonally. Thus, if the left fore and right hind-leg be raised, and advanced first, the right fore and left hind-leg will be raised the instant the others reach the ground. In fact, in trotting, the first pair are actually raised before the other legs reach the ground, so that there is a minute interval when all four legs are raised above the ground at the same time. The velocity acquired by moving the legs in pairs (as in running), instead of consecutively (as in walking), depends upon the circumstance that in trotting each leg rests on the ground during a short time and swings during a long time, while in walking the swing occupies a short period, and the rest a comparatively long one. In *cantering*, the animal, after advancing the two fore-legs one after the other, brings forward the two hind-legs simultaneously; and when this movement is greatly urged, the fore-legs are raised together, as well as the hind-legs, and the pace then becomes the *gallop*.

In *leaping*, the horse raises the fore-legs from the ground, and propels the body upward and forward by the hind legs alone. This act in the horse is, however, mainly the result of education, and those animals that leap or spring upon their prey (as the members of the cat tribe) crouch before leaping, in order to throw the body forward with the greatest possible force, by first bending all the limbs, and then suddenly extending them. As the hind legs are, however, the essential agents in leaping, we observe that in those animals whose natural mode of progression is leaping—as frogs, hares, kangaroos, etc.—the hind legs are much longer, and more muscular than the fore-legs. Leaping is a common mode of progression in many short-legged birds (blackbirds, thrushes, finches, sparrows, etc.), in which the step would be extremely short if performed by moving the legs alternately. There is also a large number of insects, such as grasshoppers, fleas, etc., whose ordinary mode of progression is by leaps; and it is in this class of animals that

the leaping power is developed to its greatest extent. The common flea, for example, can leap 200 times its own length. While fleas, locusts, and grasshoppers leap by means of their long and strong hind legs, other insects, as the *podurid*æ, or spring-tails, possess a forked tail, which they bend beneath the body, and which, when suddenly extended, propels them to a considerable distance.

Climbing, is merely walking on an inclined or vertical surface. It is usually accomplished by means of sharp nails or claws, as in the cat-tribe, the lizards, etc. In many birds, as the woodpeckers, parrots, etc., the toes are arranged in two divisions, so as to grasp branches in the manner of a hand. Bears and sloths use their arms for climbing, while monkeys use their hands, and in some cases their tails. It is only in a very few cases, as in the sloth, that this is the ordinary method of progression.

The act of *flying* in the bird is accomplished by the simultaneous action of the two anterior limbs, the wings, much as leaping is by that of the two posterior limbs. See Flying; Birds. Many attempts have been made to estimate the velocity at which different birds can fly. Whether, as has been stated, the eider-duck can fly 90, and the hawk 150 m. in an hour, is very questionable; but it has been ascertained that carrier-pigeons can accomplish from 38 to 42 m. in that time.

The bats are the only mammals which possess a true power of flight. For a description of their organs and mode of flight, we must refer to the article Bat, where will also be found a notice of the false claims of some other mammals, as the so-called flying-squirrel, to the possession of true flight. Similarly, the actions of the flying lizard and of the flying-fish are not true flight. In no class of animals is the mechanism of flight so perfect as in insects. The dragon-fly, for example, can outstrip the swallow; and can do more in the air than any bird, as it can fly backwards and sidelong, to right or left, as well as forward without turning. The wings of insects, of which there may be either one or two pair, are analagous (as instruments of motion) to the feathered wings of birds, but are regarded as homologous to (or in their essential nature) branchiæ or respiratory organs. For details regarding the mechanism employed in their aërial progression by insects, see Insects.

Swimming is the mode of progression employed by most aquatic animals. It mainly differs from flying in this respect, that water being much more dense than air, and the body of the animal being nearly of the same weight as the water it displaces, very little effort is required to keep the animal from sinking, and hence almost the whole of the muscular force can be employed in progression. In fishes, the locomotive organs consist of the fins and tail, the latter being the great propelling organ. The swimming of a fish has been correctly compared to the motion of a boat propelled by a single oar or scull at the stern. In the same manner as a succession of strokes alternately right and left propels the boat straight forward, so the fish advances by striking alternately right and left with its tail. The caudal fin, in which the tail ends, is vertical in fishes, and is usually considerably forked, when there is great speed. The ventral fins are for the purpose of keeping the fish in its proper position, with the back upwards, as is shown by a well-known experiment of Borelli, who, after cutting off these fins, restored the living fish to the water, when it rolled from side to side like a drunken man. The air-bladder with which many fishes are provided, and which they can distend and contract at pleasure, facilitates their swimming by enabling them to modify their specific gravity. Most terrestial mammals, excepting man, swim at once the first time they find themselves in deep water. The reason of this is, that their limbs move in water precisely as they do on land, and no new action either as regards direction or order is required, as is the case with man, to enable them to swim. Those which frequent the water, as seals, otters, and beavers, have webbed feet like ducks and other palmiped birds, the toes being united by membranes, which, when expanded, act as paddles. A large number of invertebrate animals move chiefly by swimming. Thus lobsters move by means of a vertical motion of the tail, and many of the crabs by means of their posterior legs, which are fashioned like oars. Many insects swim with their legs, which are fringed with hairs to give additional surface. The cuttle-fish uses its long arms as oars, and darts through the water with extreme rapidity; while other mollusks erect sail-like organs, by which they are propelled along the surface of the water. See Crustaceans; Serpents; Worms.

MOTION, in Plants. See Irritability and Spore.

MOTIONS, a name given to certain dramatic exhibitions, illustrating scriptural narrative, which prevailed in England in the 15th c. and later. The characters were represented by wooden puppets, while the dialogue was spoken behind the scenes.

MOTIVE, or Motivo, in a musical composition, means the principal subject on which the movement is constructed, and which, during the movement, is constantly appearing in one or other of the parts, either complete or modified. In elaborate and long compositions there are also secondary motives. See Leit-Motiv.

MOTLEY, a co. in n.w. Texas; formed 1876; crossed by some sources of Red river: 1080 sq.m. Pop. '90, 139. Co. seat, Matador.

MOTLEY, John Lothrop, ll.d., d.c.l., etc., American historian, was b. at Dorchester, Mass., April 15, 1814. After graduating at Harvard university, he spent a year at Göttingen, another at Berlin, and traveled in Italy and other parts of southern

Europe. Returning to America, he studied law, and was admitted to the bar in 1837; but preferring literature, he wrote a historical romance, entitled *Morton's Hope* (1839), which had little success. In 1840 he received the appointment of secretary of legation to the American embassy to Russia, but soon resigned, and in 1849 published another unsuccessful novel, entitled *Merry Mount, a Romance of the Massachusetts Colony.* He attracted attention, however, by some valuable historical essays for American reviews, among which may be mentioned one on De Tocqueville's *Democracy in America*, and another on "Peter the Great;" and having planned a history of Holland, he proceeded to Europe for materials, and after five years' labor, published in 1856 *The Rise of the Dutch Republic.* In 1860 appeared a continuation of it: *The History of the United Netherlands from the Death of William the Silent to the Synod of Dort.* Motley was appointed in 1861 U. S. minister at the court of Vienna, a post from which he was recalled in 1867. In 1869 he was sent as minister to the court of St. James, but was recalled the following year. In 1874 he published *The Life and Death of John of Barneveldt, Advocate of Holland; with a View of the Primary Causes and Movements of the Thirty Years War* (2 vols.). He died May 29, 1877. In 1890 his collected letters were published.

MOTMOT. See MOMOT.

MOTOGRAPH, an instrument by means of which musical notes may be transmitted great distances over wires. The transmitting apparatus consists of a long tube with one end covered by a thin sheet of brass diaphragm, in the centre of which a thin disk of platina is soldered. An adjustable screw, with a point of platina, is secured to a fixed pillar in front of the disk, and both it and the screw are fastened to an iron base. The receiving apparatus consists of a resonant box mounted on two short pillars; a flanged wheel fastened to a shaft easily moved by a handle; a reel back of the box containing a continuous strip of chemically prepared paper, which passes over the wheel as the handle is turned; a platina rod on the end of a spring secured to the box, pressing upon the paper, and conveying an electric current through it, and thence to the wheel, from which it is returned to the battery. The spring upon which the platina rod rests is so connected with the resonant box that one side of the latter is drawn out as the handle is turned. The friction ceases when the electric current passes through the paper, and the side of the box closes; and so for each vibration. The paper must be prepared chemically, and the plate on which it rests must be connected with the positive pole of the battery, while the negative pole is connected with the platina rod. When the current is in force the rod glides over the paper, and when it is interrupted there is considerable friction. The highest and lowest notes of the human register, as well as the softest sounds of instrumental music, can be heard in a large hall hundreds of miles distant from the transmitter. Mr. Edison is practically the inventor of the M., as we have it, although Reiss and Van Der Weyde originated the idea. The M. was first exhibited in Newark, N. J., 1877.

MOTT, MRS. (Lucretia Coffin), 1793–1880; b. Mass.; married James Mott in 1811. She taught school in Philadelphia in 1817, and the next year became a preacher in the society of Friends. She made a tour through New England and the middle states, preaching, and denouncing slavery and intemperance. She helped organize the American anti-slavery society in 1833, was a delegate to the "world's anti-slavery convention" at London in 1840, and participated in the first women's rights convention in 1848. For the rest of her life she continued her advocacy of woman-suffrage and her opposition to slavery. After the division in the society of Friends in 1827, she sided with the Hicksites.

MOTT, VALENTINE, LL.D., 1785–1865; b. N. Y.; graduated in medicine at Columbia college in 1806, and afterwards studied in London and Edinburgh. He was appointed professor of surgery in Columbia college in 1809, which place he filled till the medical department of that institution was united with the college of physicians and surgeons in 1813, and for 13 years afterwards. He then, in 1826, with Drs. Hosack, Francis, Mitchill, and others, founded the Rutgers medical college, which, owing to difficulties in regard to its charter was disorganized four years afterwards. He was for several years professor of surgery in the medical department of the university of the city of New York. Dr. Mott was celebrated as a skillful operator in all branches of operative surgery, but more particularly for the ligature of arteries, in which his experience and success was greater than that of any other (see LIGATURE). He introduced an operation for immobility of the lower jaw, and in 1821 performed the first operation for osteo-sarcoma of that member. He performed the operation of lithotomy 165 times, and amputated more than 1000 limbs. Sir Astley Cooper said of him that he had performed more of the *great* operations than any man, living or dead. He visited Europe in 1835, and traveled in England, on the continent and in the east, publishing an account of his travels in 1842. He was not a voluminous writer, the scalpel being more congenial to his hand than the pen. He, however, found time to translate Velpeau's *Operative Surgery* (4 vols. 8vo).

MOTTE, REBECCA (BREWTON), 1739–1815; b. South Carolina; married Jacob Motte, a planter. At the time of the revolution she was a widow, and resided in a house on the Congaree river, which was taken as a garrison by British soldiers. Through her aid the house was set on fire, and all the garrison captured by Marion and Lee. Her biography may be found in Mrs. Ellet's *Women of the Revolution.*

MOTTE (or MOTHE) CADILLAC, Sieur ANTOINE DE LA. See CADILLAC.

MOTTEVILLE, Madame Langlois (Françoise Bertaut de), 1621-89; b. France; daughter of a gentleman of the court and the lady's maid of Anne of Austria, whom she succeeded. At the age of 18 she was made to marry de Motteville, who was 80, and died at 82. After his death she seemed never to have a desire for marriage. Brought up at court when Richelieu was its central figure, forced to leave it with Anne of Austria, when the latter was banished from it by that minister, returning at his death; during all the years of her life devoted to her patroness, and to her memory after death she seems in the midst of a court where passions and intrigues were nearly universal, to have kept herself free from all. Her journal was published in 1723 under the title of *Mémoires pour servàir a l'histoire d'Anne d'Autriche.*

MOTTO, in heraldry, a word or short sentence which forms an accompaniment to a coat-of-arms, crest, or household badge. Mottoes were originally attached to the badge when the family had one, or to the crest where there was no badge. In later heraldry, the practice is to place the motto in an escrol either over the crest or below the shield. A motto is sometimes a religious or moral sentiment, as "Gardez la foi," "Humanitate;" it is not unfrequently a heroic exclamation or war-cry, "Courage sans peur," "Forward." In a great many cases it bears reference to the crest, badge, or some bearing of the escutcheon; thus, Stuart, earl of Moray, has for crest a pelican wounding herself, and for motto, "Salus per Christum Redemptorem;" and not a few mottoes are punning allusions to the family name—as Scudamore, "Scuto amoris Divini;" Vernon, "Ver non semper viret;" "Fare, fac," for Fairfax; and "Time Deum, cole regem," for Coleridge. Two mottoes are sometimes used by the same family—one above the crest, the other below the shield. The motto, "Dieu et mon Droit," which accompanies the royal arms of Great Britain, is supposed to have been a war-cry, and was used in England at least as early as the time of Henry VI. Its origin has been assigned to a saying of Richard I., "Not we, but God and our right have vanquished France."

MOULD, or Mouldiness, the common name of many minute fungi which make their appearance, often in crowded multitudes, on animal and vegetable substances, either in a decaying or in a living but morbid state. To the naked eye they often seem like patches or masses of fine cobweb, and are discovered by the microscope to consist of threads more or less distinctly jointed, sometimes branched. Some species of mould occur on many different substances; others seem to be peculiar to substances of particular kinds, as decaying pears, decaying gourds, etc. Some of the moulds belong to the suborder of fungi called *physomycetes.* See Fungi. One of these is the Common Mould (*mucor mucedo*), so plentifully found on fruit, paste, preserves, etc., in a state of incipient decay, the progress of which it hastens. It consists of cobweb-like masses of threads, from which rise many short stems, each bearing at the top a roundish membranous blackish spore-case.—A nearly allied, and also very common species, is *ascophora mucedo*, which forms a bluish mould on bread. From a spreading cobweb-like bed rise long slender branches, terminated by spore-cases, of which the vesicle collapses into the form of a little *pileus.*—An interesting species of mould, remarkable for its luxuriance and beauty of colors—at first white, then yellow, with orange spore-cases, then shining green or olive, and with threads often several inches long—grows on fatty substances.—Other species of mould are ranked among *hyphomycetes*, a suborder of fungi, having a floccose thallus and naked spores. One of these is the Blue Mould (*aspergillus glaucus*), which imparts to cheese a flavor so agreeable to epicures, and perhaps marks it as in a condition most suitable for promoting the digestion of other aliments, of which epicures eat too much. Advantage is often taken of the fact that a small portion of cheese affected with mould will speedily infect sound cheese into which it may be introduced. It is one of the few cases in which the propagation of these fungi is ever desired and sought after by man.—Snow Mould (*lanosa nivalis*) is found on grasses, and especially on barley and rye beneath snow, often destroying whole crops. It appears in white patches of a foot or more in diameter, which finally become red as if dusted with red powder.

Even living animals are liable to be injured by fungi of this kind. Silk-worms are killed in great numbers by one called Muscardine (q.v.), or Silk-worm Rot. Such fungi are sometimes developed on the mucous membrane and in internal cavities of vertebrated animals; and on the bodies of invertebrate animals, as the common house-fly, which, in the end of autumn, when it becomes languid, often dies from this cause. Even strongly-scented substances, if moist, are liable to be attacked by mould of one kind or other; nor are strong poisons, either animal or vegetable, a sufficient safeguard. *Ascophora mucedo*, springs up readily in paste full of corrosive sublimate; and the mycelium of moulds is found in strong arsenical solutions. The only sure preventive of mould is dryness. Many of the moulds vegetate in liquids, but do not attain their perfect development, only appearing as filamentous and flocculent mycelia. The *vinegar plant* (q.v.) is an instance of this kind.

Mildews and moulds are very nearly allied.

The rapidity with which these fungi are produced is marvelous. "In favorable circumstances, a plant will pass through every stage of growth to perfect maturation of its

seeds in less than two days, the threads which sustain the ripe sporangia being so long, and yet so delicate, as to make it a marvel that they can remain erect."—(*Berkeley.*)

MOULD, the model or pattern from which workmen execute mouldings, ornaments, etc. Also, the shape or bed in which metal and other castings are made.

MOULD, JACOB WREY, b. England, 1825; educated in Cork, Ireland, for matriculation at King's college, London, which he entered in 1839, graduating with honors in 1842. He was then articled to the celebrated architect, Owen Jones, and executed with his own hands, from casts or from Mr. Jones's sketches, illustrations of the second volume of *The Alhambra.* Soon after he produced illuminated illustrations for *Gray's Elegy,* the *Book of Common Prayer,* and a considerable part of Owen Jones's *Grammar of Ornament.* In 1849 he became associated with Lewis Vuliamy a London architect, and during the illness of his patron designed and erected the beautiful mansion at Stanhope Gate, Hyde Park, London, on the site of the marquis of Hereford's *Gaunt House.* After its completion, he was again associated with Owen Jones in the construction and decoration of the Moresque-Turkish divan at Buckingham Palace, and in the decoration of the exhibition building of 1851. A few years later he came to the United States and was engaged by Moses H. Grinnell to design and superintend the erection of All Souls (Unitarian) church, on 4th avenue, New York city; a building which, by its departure from previous models in that city, excited lively attention and criticism. In 1857 he was appointed assistant on the architectural staff of the Central Park commissioners, associated with Calvert Vaux, the chief architect. From that time until 1874, Mould, as assistant architect, designed many details of the bridges, terraces and architectural structures in the Central Park. In 1870 Mould was made architect-in-chief of the department of public parks, and retained that place until 1874, when he was removed by a change of commissioners. The same year he was invited to Lima, Peru, to execute architectural work for Henry Meiggs, and was there working out his designs when the death of Meiggs, in 1877, and the war with Chili soon after, necessitated his return to New York in 1879. In the year 1880 Mould was appointed to design the architectural features of the new Morningside park, New York city. He also designed the temporary tomb of Gen. Grant. He d. in 1886.

MOULDING. See FOUNDING.

MOULDINGS, the curved and plane surfaces used as ornaments in cornices, panels, arches, etc., and in all enriched apertures in buildings. In classic architecture the mouldings are few in number, and definitely fixed in their forms. There are eight kinds of these regular mouldings, viz, the Cyma, the Ovolo (or Echinus), the Talon, the Cavetto, the Torus, the Astragal, the Scotia, and the Fillet (q.v.); and each of these mouldings has its proper place assigned to it in each order. See COLUMN. In Gothic architecture, and all other styles, the mouldings are not reduced to a system as in the Greek and Roman styles, bnt may be used in every variety of form at the pleasure of the artist. Certain forms generally prevail at one period in any style. Thus, in Gothic architecture, the date of a building may in many instances be determined by the form of the mouldings. The Norman mouldings were very simple in outline, and very frequently enriched with the zigzag and billet ornaments.

In the early English style, the mouldings are also simple in outline, and are usually arranged in rectangular divisions, and consist of alternate rounds and hollows. In late examples of this style, the fillet was introduced and led to the more elaborate form of mouldings during the decorated period.

The mouldings of the perpendicular style are generally flatter and thinner than the preceding, and have large hollows separated by narrow fillets, which produce a meager effect.

Each of these styles has its peculiar ornaments and style of foliage; and when these are used along with the mouldings, there is no difficulty in determining the approximate date of a building.

MOULINS, a t. of France, capital of the department of Allier, on the right bank of the river Allier, here crossed by a handsome stone bridge of 13 arches, lies 194 m. by railway s.e. of Paris, and 39 m. e.n.e. of Montluçon. Moulins was formerly the capital of Bourbonnais. It is a clean, well-built town, with pretty promenades. The principal buildings are the cathedral of Notre Dame (for the enlargement of which the sum of one and a half million francs was granted in 1852), the museum, the theater, the public library containing 30,000 vols., the new town-house, the palace of Justice, and the college. Of the old castle, built by the duc de Bourbon in 1530, only a square tower remains, which is used as a prison. Moulins carries on trade in coal, wood, iron, grain, wine, oil, and cattle. Pop. '91, 18,900.

MOULMEIN', a t. and seaport of Lower Burma, district of Amherst, situated on the gulf of Martaban, in the e. of the bay of Bengal, at the junction of the rivers Salwin, Gyne, and Attaran, in 16° 30′ n. lat., and 97° 38′ e. long. Moulmein, one of the healthiest stations in India, is a pretty specimen of an eastern town. It is divided into five districts, each of which is under a goung, or native head of police. The streets are, for the most part, shaded with trees, principally of the acacia tribe, and the glossy jack is often seen half covering a native house, its great fruit, as large as a child's head, ripening in

the sun. The principal street, about 3 m. in length, runs due n. and s., and parallel with the river Salwin. The native houses are constructed in the usual Burman style of bamboo, and a thatch made of the leaf of the water-palm. All are raised on piles, according to the universal custom of the country. Men walk about with the green paper chattah, or Chinese umbrella, used throughout the provinces; the *gharei*, or India cab, dashes along, the attendant imp reveling in heat and dust.

Moulmein is backed by a fine range of hills, on whose heights flash the gilded spires of innumerable pagodas; and here, too, are built many pretty residences, commanding a fine view of the town, river, and adjacent country, which for picturesque beauty and varied scenery has few equals. Moulmein boasts various churches, chapels, and missionary establishments, several charitable and educational institutions, substantial barracks, a general hospital, public library, etc. Vessels drawing 10 ft. of water can come up to Moulmein under charge of pilots from Amherst, and at spring-tide ships of any tonnage may reach the town. The rise and fall of the water is at that time from 20 to 23 feet. The population of Moulmein is changeable; in 1856 it was 43,683; in 1880, 53,080; in 1891, 50,700. Of these, divided according to their religion, about 27,000 were Buddhists, 13,000 Hindus, 6,000 Mussulmans, and 2,000 Christians. The mean temperature of Moulmein for the year is 78°—the highest being 83° in April, and the lowest 75° in Jan. As to nationality, besides the Burmans proper, the inhabitants of Moulmein include Eurasians, or half-castes, Taliens, Chinese, Shans, Karens, Armenians, Jews, Malays, and natives of Hindustan.

Moulmein possesses great facilites for ship-building, and many fine vessels have lately been constructed in the building-yards of Tavoyzoo and Mopoon. The principal exports from Moulmein are teak-timber and rice; the imports consist of general merchandise, chiefly piece-goods, hardware, provisions, and sundries.

See *The Tenasserim and Martaban Directory*; Winter's *Six Months in British Burmah* (London, 1858); Marshall's *Four Years in Burmah* (London, 1860); *Blue-Books*.

MOULTING is the term applied by naturalists to the periodical exuviation, or throwing off of certain structures, which are for the most part of an epithelial or epidermic character. Thus, in a considerable number of the *articulata* the external covering is thrown off and replaced many times during life. In some of the minute entomostracous crustacea of our pools, a process of moulting, similar to that which occurs in crabs and lobsters, occurs every two or three days, even when the animals seem to have attained their full growth. In the crabs, in which the process has been carefully observed, the *exuvium*, or cast-off shell, consists not only of the entire external covering, including even the faceted membrane which forms the anterior coat of the compound eyes, but also carries with it the lining membrane of the stomach, and the plates to which the muscles are attached. During growth this moulting takes place as often as the body becomes too large for the shell; and after the animal has attained its full size it is found to occur at least once a year, at the reproductive season. During the early growth of insects, spiders, centipedes, etc., a similar moult is frequently repeated at short intervals, but after they have attained their full size no further moulting takes place. In the *vertebrata* we have examples of as complete a moulting, and replacement of new skin, among frogs and serpents as occurs in the articulata, the whole epidermis being thrown off at least once, and, in some instances, several times yearly. In birds the feathers are periodically cast off and renewed; in mammals generally the hair is regularly shed at certain periods of the year; and in the deer tribe the casting off and renewal of the antlers must be regarded as a special example of moulting. In man the continual exuviation of the outer layers of the epidermis is a process analogous to that which takes place in the lower animals.

MOULTON, Ellen Louise Chandler, b. Conn., 1835; married William V. Moulton, a Boston journalist, in 1855. Besides many contributions to periodicals, chiefly of fiction and poetry, she has published *This, That, and the Other* (1854); *Juno Clifford* (1855); *My Third Book* (1859); *Bedtime Stories* (1873); *Some Women's Hearts* (1874); *More Bedtime Stories* (1874); *Poems* (1877); *New Bedtime Stories* (1880); *Random Rambles* (1881); *Miss Eyre from Boston* (1889); *In the Garden of Dreams* (1890), etc.; a collection of the poems of Philip Bourke Marston, with biography (1892); *Arthur O'Shaughnessy, His Life, and His Work*, with selections from his poems (1894), etc.

MOULTON, Jeremiah, 1688–1765; b. Me.; stolen by the Indians while a child, but eventually returned on the release of some Indian prisoners. In 1724 he commanded the forces that captured the town of Norridgewock from the Indians. He was afterwards prominent in Maine as a judge of the court of common pleas.

MOULTRIE, a co. in e. Illinois, intersected by the Wabash, the Chicago and Eastern Illinois, and the Peoria, Decatur, and Evansville railroads; 340 sq. m.; pop. '90, 14,481, chiefly of American birth, with colored. Its surface is generally level and well timbered, and its fertile prairies are drained by the head waters of the Kaskaskia river. Grain and live stock are the chief products. Co. seat, Sullivan.

MOULTRIE, Fort, a fortress on Sullivan's Island, at the mouth of Charleston Harbor, S. C., celebrated for the repulse of a British squadron commanded by sir Peter Parker, Jan. 28, 1776. The fort, at that time, was hastily built of palmetto logs and sand, with 31 guns and 435 men. The spongy wood of the palmetto was found to resist the cannon

balls perfectly. The fort was afterwards rebuilt, and in April, 1861, took part in the reduction of Fort Sumter, and the commencement of active hostilities in the civil war of secession.

MOULTRIE, JOHN, d. 1773; b. Scotland: a physician who emigrated to this country about 1730, and, settling in Charleston, secured a large practice.

MOULTRIE, JOHN, 1799–1874; b. London; educated at Eton—where he was associate editor, with Hartley Coleridge and W. M. Praed, of the *Etonian*—and at Cambridge. He took orders in the English church, and was made rector of Rugby church, where he remained for the rest of his life. He published a volume of *Sermons* in 1852, and the same year edited the *Poetical Remains* of his fellow-Etonian, W. Sidney Walker. In 1845 he edited the works of Gray, and in 1854 his own complete *Poems* were published.

MOULTRIE, WILLIAM, 1731–1805; b. S. C.; son of Dr. John, a Scotch physician who settled in Charleston early in the century. He received an ordinary education, and in the Cherokee troubles of 1761 was a captain in the militia. Though of British descent and closely connected with many tories, Moultrie was prominent in the popular movements which preceded the revolution; in 1775 was a delegate to the colonial congress, and in the same year was chosen colonel of a S. C. regiment. He assisted in the seizure of the arsenals and forts, placed a battery at Haddrill's Point, which drove off two blockading vessels, and when the siege of Charleston by the fleet of Sir Peter Parker and Sir Henry Clinton's land forces was threatened, obtained permission to construct a fort of palmetto logs on Sullivan's Island, which he began in March, 1776. (See MOULTRIE, FORT.) Gen. Lee, the commander-in-chief, thought the position poor and the construction faulty, but when on June 28 the fleet appeared, the terrific canonade of the ships produced little effect on the soft palmetto wood, while Moultrie, though poorly supplied with ammunition, made every shot tell, and at night the fleet retired with a loss of 225 killed and wounded, the colonial forces having but 36 men disabled. This defence resulted in the withdrawal of the British forces from the coast of South Carolina. Moultrie received the thanks of congress, and in his honor the fort was named Fort Moultrie. In September of the same year Moultrie was made a brigadier-general and put in command of the department of Georgia and South Carolina. In 1779 the British forces again appeared, and under Col. Gardner were defeated by Gen. Moultrie near Beaufort. When Gen. Provost was advancing upon Charleston, Moultrie obstructed him in every way, and thus gave the city time to prepare for its defense. Here he again displayed military ability, was held a prisoner for two years after the surrender, and at last exchanged for Gen. Burgoyne. In 1782 he was made a major-general; in the years 1785 and 1794 was elected governor of his state, and then retired to private life. His *Memoirs of the Revolution* (1802) was written in part while he was a prisoner, and finished in later years.

MOUND (Lat. *mundus*), in heraldry, a representation of a globe, surmounted with a cross (generally) pattée. As a device, it is said to have been used by the emperor Justinian, and to have been intended to represent the ascendency of Christianity over the world. The royal crown of England is surmounted by a mound, which first appears on the seal of William the Conqueror, though the globe without the cross was used earlier.

MOUND BIRD. See BRUSH TURKEY.

MOUNDS, and MOUND BUILDERS. See AMERICA (AMERICAN ANTIQUITIES).

MOUNDSVILLE, city and co. seat of Marshall co., W. Va.; on the Ohio river and the Baltimore and Ohio and the Ohio River railroads; 10 miles s. of Wheeling. It contains the state penitentiary, hospital, Trinity parish institute and library, the largest Indian mound in the Ohio valley, electric and natural gas light plants, coal mines, cotton mill, glass, shoe, and cigar factories, and state banks. Pop. '90, 2,688.

MOUNT, in heraldry. When the lower part of the shield is occupied with a representation of ground slightly raised, and covered with grass, this is called a mount in base; e.g., argent, on a mount in base, a grove of trees ppr.—Walkinshaw, of that ilk, Scotland.

MOUNT, WILLIAM SIDNEY, 1807–68; b. on Long Island; until about 17 years old worked on his father's farm. He was made apprentice to his brother, a sign painter in New York city; displayed a taste for art; entered the school of the Academy of Design in 1826, and in 1829 began the work of portrait painting in New York. Among his best portraits were those of Gen. Jeremiah Johnson and Bishop Onderdonk. His greatest success, however, was in depicting humorous scenes, and especially those of negro life. His "Rustic Dance," 1830, was very popular, and in 1832 he was made a member of the National Academy of Design. Among his pictures are, "Walking the Crack," "Husking Corn," "Nooning," "Banjo Player," etc.

MOUNTAIN, THE. The popular name given by the French to that part of the assembly of deputies which assumes the most radical or progressive part in legislature; and of late years more generally known as "the left"—*La Gauche.* The term "mountain" was first used when the national assembly of 1789–91 moved from Versailles to Paris and occupied the riding-hall of the Louvre prepared for it. The most radical revolutionists chose the highest seats on the outside of the circle, and thus acquired the title. See MONTAGNARDS; POLITICAL PARTIES, FRENCH.

MOUNTAIN, George Jehoshaphat, d.d., d.c.l., 1789–1863; b. England; second son of Jacob Mountain, first Anglican bishop of Quebec; graduated at Trinity college, Cambridge, in 1810. Two years later he took orders and was nominated rector of Fredericton, New Brunswick. One preferment after another rapidly followed; and in 1850 he became bishop of Quebec. He spent the greater part of his means in founding Bishops' college, in Lennoxville, P. Q. Among his published works are *Journal of a Northwest American Mission*, and *Songs of the Wilderness.*

MOUNTAIN, Jacob, d.d., 1750–1825; b. in Norfolk, England, educated at Cambridge university; took orders and held in succession the livings of St. Andrews, Buckden, and Holbeach, and was made a canon in the Lincoln cathedral. In 1793 he was nominated to the bishopric of Quebec and was the first prelate sent to the Canadas by the English church. In the establishment of mission stations and churches he was most active, and took a prominent part in the political affairs of the province.

MOUNTAIN ASH. See Rowan Tree.

MOUNTAIN BEAVER. See Sewellel.

MOUNTAIN CORK. See Asbestus.

MOUNTAIN GREEN. See Chrysocolla.

MOUNTAIN LIMESTONE, the basement rock of the carboniferous series in the s. of England and in Wales. It consists of a calcareous rock loaded with marine remains, the greater part of the rock being made up bodily of corals, crinoids, and shells. It has a variable thickness, sometimes reaching 900 feet. See Carboniferous System.

MOUNTAIN MEADOWS MASSACRE, an atrocity committed by the Indians in 1857, in Mountain Meadows, Santa Clara co., Utah; as is supposed, under the instigation and direction of the Mormon leaders. A party of 120 emigrant settlers, on their way through Utah to California, had in some way aroused the suspicions of the Mormons, and at the place named were surrounded by Indians under Mormon control, and brutally massacred; only a few children of the party survived. In 1874 an investigation into the affair was ordered by the U. S. government, and John D. Lee, a Mormon bishop, and others, were indicted, tried, and condemned. Lee was executed on Mar. 22, 1877, by being shot on the very spot where the massacre took place.

MOUNTAINS. The number and the altitude of the mountains of the globe are so great that they form almost everywhere prominent objects, and operate to a large extent in modifying the climatic condition of every country in the world. Yet the amount of solid material so raised above the ordinary level of the land is not so much as might be expected. Remembering that elevated plateaus of great extent occur in several regions, and that the general surface of the earth is considerably higher than the sea level, it has been estimated that were the whole dry land reduced to a uniform level, it would form a plain having an elevation of 1800 ft. above the sea. And were these solid materials scattered over the whole surface of the globe, so as to fill up the bed of the ocean, the resulting level would be considerably below the present surface of the sea, inasmuch as the mean height of the dry land most probably does not exceed $\frac{1}{15}$th of the mean depth of the bed of the ocean.

Mountains, and especially mountain-chains, subserve important uses in the economy of nature, especially in connection with the water system of the world. They are at once the great collectors and distributors of water. In the passage of moisture-charged winds across them, the moisture is precipitated as rain or snow. When mountain-ranges intersect the course of constant winds by thus abstracting the moisture, they produce a moist country on the windward side, and a comparatively dry and arid one on the leeward. This is exemplified in the Andes, the precipitous western surface of which has a different aspect from the sloping eastern plain; and so also the greater supply of moisture on the southern sides of the Himalayas brings the snow-line 5,000 feet lower than on the northern side. Above a certain height the moisture falls as snow, and a range of snow-clad summits would form a more effectual separation between the plains on either side than would the widest ocean, were it not that transverse valleys are of frequent occurrence, which open up a pass, or way of transit, at a level below the snow-line. But even these would not prevent the range being an impassable barrier, if the temperate regions contained as lofty mountains as the tropics. Mountain-ranges, however, decrease in height from the equator to the poles in relation to the snow-line.

The numerous attempts that have been made to generalize on the distribution of mountains on the globe have hitherto been almost unsuccessful. In America the mountains take a general direction more or less parallel to the meridian, and for a distance of 8,280 miles, from Patagonia to the Arctic ocean, form a vast and precipitous range of lofty mountains, which follow the coast-line in South America, and spread somewhat out in North America, presenting everywhere throughout their course a tendency to separate into two or more parallel ridges, and giving to the whole continent the character of a precipitous and lofty western border, gradually lowering into an immense expanse of eastern lowlands. In the old world, on the other hand, there is no single well-defined continuous chain connected with the coast-line. The principal ranges are grouped together in a Y-shaped form, the general direction of which is at right angles to the new

world chain. The center of the system in the Himalayas is the highest land in the hemisphere. From this, one arm radiates in a north-east direction, and terminates in the high land at Behring straits: the other two take a westerly course; the one a little to the north, through the Caucasus, Carpathians, and Alps to the Pyrenees; the other more to the south, through the immense chain of Central African mountains, and terminating at Sierra Leone. Most of the principal secondary ranges have generally a direction more or less at right angles to this great mountain tract.

The inquiry into the origin of mountains is one that has received not a little attention. Geologists have shown that the principal agents in altering the surface of the globe are denudation, which is always abrading and carrying to a lower level the exposed surfaces, and an internal force which is raising or depressing the existing strata, or bringing unstratified rocks to the surface. Whether the changes are the small and almost imperceptible alterations now taking place, or those recorded in the mighty mountains and deep valleys everywhere existing, denudation and internal force are the great producing causes. These give us two great classes of mountains.

1. *Mountains produced by denudation.*—The extent to which denudation has altered the surface of the globe can scarcely be imagined. All the stratified rocks are produced by its action; but these do not measure its full amount, for many of these beds have been deposited and denuded, not once or twice, but repeatedly before they reached their present state. Masses of rock more indurated, or better defended from the wasting currents than those around, serve as indices of the extent of denudation. The most remarkable case of this kind with which we are acquainted, is that of the three insulated mountains in Ross-shire—Suil Veinn, Coul Beg, and Coul More—which are about 3,000 ft. high. The strata of the mountains are horizontal like the courses of masonry in a pyramid, and their deep red color is in striking contrast with the cold bluish hue of the gneiss which forms the plain, and on whose upturned edges the mountain-beds rest. It seems very probable, as Hugh Miller suggests, that when the formation of which these are relics (at one time considered as old red sandstone, but now determined by sir Roderick Murchison as being older than Silurian), was first raised above the waves, it covered, with an amazing thickness, the whole surface of the highlands of Scotland, from Ben Lomond to the Maiden Paps of Caithness, but that subsequent denudation swept it all away, except in circumscribed districts and in detached localities like these pyramidal hills.

2. *Mountains produced by internal force.*—These are of several kinds. (*a.*) Mountains of ejection, in which the internal force is confined to a point, so to speak, having the means of exhausting itself through an opening in the surface. The lava, scoriæ, and stones ejected at this opening form a conical projection which, at least on the surface, is composed of strata sloping away from the crater. Volcanoes are mostly isolated conical hills, yet they chiefly occur in a somewhat tortuous linear series, on the mainland and islands which inclose the great Pacific ocean. Vesuvius and the other European volcanoes are unconnected with this immense volcanic tract. (*b.*) But the internal force may be diffused under a large tract or zone, which, if it obtain no relief from an opening, will be elevated in the mass. When the upheaval occurs to any extent, the strata are subjected to great tension. If they can bear it, a soft rounded mountain-chain is the result; but generally one or more series of cracks are formed, and into them igneous rocks are pushed, which, rising up into mountain-chains, elevate the stratified rocks on their flanks, and perhaps as parallel ridges. Thus, the Andes consist of the stratified rocks of various ages, lying in order on the granite and porphyry of which the mass of the range is composed. The position of the strata on such mountains supplies the means of determining, within definite limits, the period of upheaval. The newest strata that have been elevated on the sides of the mountain when it was formed, give a date antecedent to that at which the elevation took place, while the horizontal strata at the base of the mountain supply one subsequent to that event. Thus, the principal chain of the Alps was raised during the period between the deposition of the tertiary and that of the older recent deposits. (*c.*) But there is yet another way in which the upheaving internal force operates, viz., where it does not act at right angles to the surface, but rather obliquely, and, as it were, pushes the solid strata forwards, causing them to rise in huge folds, which, becoming permanent, form parallel ranges of mountains. The crust of the earth, in its present solid and brittle condition, is thus curved, in a greater or less degree, by the shock of every earthquake; it is well known that the trembling of the earth is produced by the progress of a wave of the solid crust; that the destruction of buildings is caused by the undulation; and that the wave has been so evident, that it has been described as producing a sickening feeling on the observer, as if the land were but thin ice heaving over water. This mode of mountain formation has been explained when treating of the Appalachians (q.v.), which were thus formed. Many other ranges have had a similar origin, as some in Belgium and in the southern Highlands of Scotland, as has been suggested by Mr. Carruthers.

It is evident that in the last two classes the parallel ridges were produced at the same time. Elie de Beaumont generalized this, maintaining that all parallel ridges or fissures are synchronous; and on this he based a system of mountain-structure, which is too universal and too geometrical to be true. The synchronism of parallel fissures had been noticed by Werner, and it is now received as a first principle in mining. The converse

is also held to be generally true, that fissures differing in direction differ also in age; yet divergence from a center, and consequent want of parallelism, as in the case of volcanoes, may be an essential characteristic of contemporaneity. Nevertheless, Elie de Beaumont classified the mountains of the world according to this parallelism, holding that the various groups are synchronous. The parallelism does not consist in having the same relations to the points of the compass—for these, as regards n. and s., would be far from parallel—but is estimated in its relation to some imaginary great circle, which being drawn round the globe would divide it into equal hemispheres. Such circles he called great circles of reference. But beyond this, he went a step further, and proposed a more refined classification, depending on a principle of geometrical symmetry, which he believed he had discovered among his great circles of reference. It is to be feared, however, that his geometrical speculations have little foundation. See GEOLOGY.

MOUNTAINS OF THE MOON, the name of a supposed range of mountains running across central Africa, from the Atlantic to the Indian ocean. The Nile was supposed by the ancient geographers to rise in them. Modern explorations have disproved the existence of any such range. Speke, in 1858, gave the name to the mountains n. of lake Tanganyika.

MOUNT CARMEL, a borough in Northumberland county, Penn.; is 28 m. s.e. of Sunbury, on the Lehigh Valley, the N. Central and the Philadelphia and Reading railroads. It has daily and weekly newspapers, a national bank, and there are several anthracite coal mines in the vicinity. Pop. '90, 8,254.

MOUNT DESERT, an island in Maine, having Frenchman's Bay and five rocky islands called the Porcupines on the e.; Mount Desert rock 20 m. s. in the open sea, and Soames's sound flowing up into its s. portion for about six m., the island being 7 m. in width and 14 m. long; pop. '90, 5,337. It is included in Hancock co., and includes the villages of Eden, Mount Desert, Tremont, Bar Harbor, Asticon, Seal Harbor, Northeast Harbor, Southwest Harbor, Soamesville, and Seal Cove. The Mount Desert post-office is at Soamesville. The island is one mile from the mainland, and has three convenient harbors—Bar Harbor, Northeast, and Southwest. Great Head and Schooner Head are tall cliffs on the s.e. coast. It is crossed by seven ridges of hills, the highest peak, Mount Adam or Mount Green, rising to an altitude of 1535 ft. above the level of the sea; and among the mountains are beautiful lakes of considerable size. It is celebrated for the grandeur and beauty of its scenery, and is much frequented as a summer resort. It is 30 m. s.e. of Bangor, and was first discovered by the French in 1608, who named it St. Sauveur, but the settlement was destroyed in 1616 by an expedition commanded by Samuel Argall, of Virginia, under the governorship of Sir Thomas Dale. The first house of the future permanent settlement was built by Abraham Soames, in the center of the island, overlooking the head of the sound in 1761. It has excellent public schools, churches, and numerous hotels. It has a prosperous community engaged in cod and mackerel fishing, the manufacture of lumber, and shipbuilding. A feature of peculiar attractiveness as compared with many seashore resorts is the combination of mountain and marine scenery.

MOUNTFORD, WILLIAM, 1816–85, b. England, educated at Manchester college, York; became a Unitarian minister, and was pastor of a church in Manchester from 1838–41. In 1846 he published a book entitled *Martyria*, and in 1850, *Euthanasia*, works which gave him some reputation. During 1850 he also visited the United States, and accepted the pastorate of a Unitarian church in Gloucester, Mass.

MOUNT HOLLY, town and co. seat of Burlington co., N. J.; on the Rancocas river and the Pennsylvania railroad; 19 m. n.e. of Philadelphia. It contains the Burlington county hospital, Mount Holly academy, public library, children's home, several national banks, about 10 churches, electric light plant, and several iron foundries and shoe factories. There are waterworks operated by a private corporation, street railroad, and weekly and monthly periodicals. Pop. '90, 4,930.

MOUNT HOLYOKE SEMINARY AND COLLEGE, at South Hadley, Mass., 2 m. e. of the Connecticut river, and 4 m. s. of the mountain from which it takes its name. Its founder was Miss Mary Lyon, a woman who combined, in an unusual degree, physical, intellectual and moral strength. During ten years of successful teaching in a private school, her attention was awakened to the importance of establishing a permanent institution for the education of young women, where the expenses should be very moderate and the advantages very great. The problem was difficult. At that time many people thought that for the higher education of girls little more was needed than a superficial acquaintance with a few ornamental branches. There were private schools that promised this for the daughters of the rich, and district schools sufficed for the rest. Why should colleges be established with faculties, buildings, libraries, cabinets, and apparatus, merely to educate girls? For a long time the public could not be aroused to the importance of the subject. The rich were even more indifferent than the middle classes. But as Miss Lyon thought on the enterprise she became thoroughly absorbed in it, and was willing to spend her life in poverty and toil for its sake. In 1834 she devoted herself to the task. Little by little funds were collected for the first building. Its corner-stone was laid in October, 1836, and the school opened November, 1837. Its principal objects were: 1. To provide for young women with limited pecuniary resources

a thorough practical education. 2. To supply, not a preparatory school for younger pupils, but (virtually) a college for those of maturer years, admitting none under 16 years of age. 3. To educate superior teachers. 4. To arrange the institution so that the pupils should do the household work themselves, partly in order to reduce expense, but chiefly to teach the dignity of such work and to promote health, cheerfulness, independence, and symmetry of character. These objects have been kept steadily in view, and with great and increasing success through more than 50 years. The prescribed course of study embraced three years, until 1862, when a fourth year was added. In 1888 a college charter was granted and the institution was known as Mount Holyoke Seminary and College. In 1893 under a new charter the seminary course was discontinued and the name changed to Mount Holyoke College. President, Mrs. Elizabeth Storrs Mead, A.M. The terms for board, tuition and incidentals have always been as low as would suffice to cover the ordinary running expenses. At present the sum of $250 per annum includes all charges. The buildings, grounds, library, and apparatus have been furnished chiefly by private benefactions; with the addition of $40,000 granted by the legislature of Massachusetts in 1868, after a careful inquiry into the usefulness of the seminary during the 30 years of its existence. The annual income from payments for board and tuition is about $55,000, in addition to which a small amount is received from invested funds given for specific objects connected with the welfare of the institution. The grounds comprise 101 acres of picturesque scenery, in which nature has, to some extent, anticipated the work of the landscape gardener. A botanical garden covers about one acre of ground. The original main building which had been enlarged until it accommodated about three hundred students, together with the gymnasium, was destroyed by fire, Sept. 27, 1896. The main dormitory has been replaced by five cottages, equipped with all modern improvements and accommodating from 50 to 90 students each. A fine Administration Building contains chapel, assembly room and the offices of the president, registrar and treasurer. The other buildings are: two small dormitories; the library, a fire-proof edifice, well arranged and handsomely furnished; the Lyman Williston hall containing well-appointed lecture and recitation rooms, cabinets of mineralogy, geology, botany and zoology, biological laboratories, and an art gallery enriched with superior original paintings by celebrated American artists, and some fine copies of works by old masters, an admirably furnished observatory, with a fine telescope; and Science hall containing lecture and recitation rooms and fully equipped chemical and physical laboratories. The library contains more than 16,000 volumes of carefully selected works, in English literature, in the French, German, Latin, and Greek languages, and in science and art. The instruction is given by the president and a faculty of thirty-one resident and three non-resident teachers. Lecture courses are given each year by several distinguished professors from other institutions. The total number of students in 1896 was 331.

MOUNT PLEASANT, city and co. seat of Henry co., Ia.; on a branch of the Skunk river and on the Burlington route railroad; 28 miles n.w. of Burlington. It is the seat of the State hospital for the insane, the Iowa Wesleyan university, the German college (Meth. Epis.), and the Howe academy, and has hospital, university, and ladies' libraries, gas and electric light plants, waterworks, national and savings banks, and manufactories of flour, carriages and wagons, and agricultural utensils. Pop. '90, 3,997.

MOUNT PLEASANT, a town in Westmoreland co., Pa.; on the Baltimore and Ohio and the Pennsylvania railroads; 11 miles s. of Greensburg, the co. seat. It is the seat of the Western Pennsylvania classical and scientific institute (Bapt.), and has a public school library, glass factory, flour, grist, and planing mills, distillery, brewery, electric lights, over 15 churches, several national banks, and weekly newspaper. It is in the center of one of the largest coke fields in the United States. Pop. '90, 3,652.

MOUNT SAINT ELIAS. See ALASKA.

MOUNT TOM, a mountain or range on the west bank of the Connecticut river, in Hampden and Hampshire counties, divides the valley of the Connecticut longitudinally. It is about five miles south of Northampton and has an altitude above the sea of 1214 feet (200 more than Mt. Holyoke). The northern peak of the range, called Mt. Nonotuck, has a hotel on the summit. The views obtained are very fine.

MOUNT VERNON, city and co. seat of Posey co., Ind.; on the Ohio river and the Louisville and Nashville and the Evansville and Terre Haute railroads; 20 miles w. of Evansville. It has a commanding situation on the north bank of the river, and contains a public library, high school, separate churches and schools for white and colored people, electric light plant, waterworks supplied from the river, a hominy, grits, and corn flour mill, several large flour mills, planing, saw, stave, and heading mills, foundry, etc. Pop. '90, 4,705.

MOUNT VERNON, a city in Westchester co., N. Y.; on the Bronx river and the New York, New Haven, and Hartford, and the New York Central and Hudson River railroads; 13 miles n. of New York. It was incorporated as a village in 1853 and chartered as a city in 1892. The city contains a hospital, public library, Y. M. C. A. building, graded public schools, gas and electric light plants, electric street railroad system, about

16 churches, several state banks, and daily and weekly newspapers. Portions of the city have a sufficient elevation to command a fine view of Long Island sound, and on these are costly residences. Pop. '90, 10,830.

MOUNT VERNON, city and co. seat of Knox co., O., on the Kokosing river, 45 miles n.e. of Columbus, and 25 m. n.w. of Newark; on the Baltimore and Ohio and the Cleveland, Akron, and Columbus railroads. The river furnishes extensive water-power, utilized by flour and saw mills, the manufacture of woolen goods, flax, twine, etc. In the city are locomotive works, Corliss engine works, furnace foundry, and manufactories of furniture, leather, linseed oil, sashes and doors. It is the center of a considerable trade from the fertile agricultural region in its vicinity. It is lighted with electricity, and has churches, excellent public schools, court-house, several banks, Hiawatha park with a picturesque lake, and electric street railroad. Near it are Mount Vernon Academy and Kenyon College. Pop. '90, 6027.

MOUNT VERNON, the home and burial-place of George Washington, in Fairfax co., Virginia, on the right bank of the Potomac, 15 m. s. of Washington. The Washington mansion is of wood, 2 stories high, 96 ft. long, and 30 ft. deep. It was built in 1743, by Washington's elder brother Lawrence, who called it Mount Vernon, after Admiral Vernon, under whom he had served in the British navy. It is on a wooded hill from which there is a beautiful view of the Potomac, down to which a lawn of 5 or 6 acres slopes. A high piazza runs along the front of the house, which has 6 rooms of moderate size on the ground floor. They contain many objects of historical interest. The library was designed by Washington himself, but at present contains little of the original furniture. Most of Washington's books are in the possession of the Boston Athenæum. The tomb of Washington is a few hundred yards from the house, near a wooded ravine. The body of Washington was removed thither from the old family vault in 1831. An effort was made in 1832 to secure the removal of the body to the crypt of the capitol at Washington, but the representatives of the family refused. Mount Vernon, which had been much enlarged by Washington, was by him bequeathed to Bushrod Washington, upon whose death it came into the hands of his nephew, John A. Washington, who sold it in 1858 to the Ladies' Mount Vernon association for $200,000, of which $68,494.59 was the contribution of Edward Everett. The association hold the place in trust, as a place of public interest; and upon the dissolution of the association, or its failure to perform the objects for which it was formed, Mount Vernon will revert to the state of Virginia. Mount Vernon originally comprised several thousand acres, and was known as the "Hunting Creek estate." The ground, 200 acres, purchased with the mansion has been increased in area by the addition of an adjoining tract. The old garden with its formal box hedges and greenhouse is especially beautiful. Mount Vernon is reached from Washington by daily steamers, and the Washington, Alexandria, and Mount Vernon electric railway.

MOUNT WASHINGTON. See WASHINGTON, MOUNT.

MOURNE MOUNTAINS. See DOWN, COUNTY OF.

MOURNING, a particular habit worn to express grief, especially for the decease of friends. The usages regarding mourning have varied much at different times and in different countries. Among the Jews, the duration of mourning for the dead was generally 7, but sometimes protracted to 30 days; and the external indications of sorrow consisted in weeping, tearing the clothes, smiting the breast, cutting off the hair and beard, lying on the ground, walking barefoot, and abstaining from washing and anointing themselves. Among the Greeks, the period was 30 days, except in Sparta, where it was limited to 10. The relatives of the deceased secluded themselves from the public eye, wore a coarse black dress, and in ancient times cut off their hair as a sign of grief. Among the Romans, the color of mourning for both sexes was black or dark-blue under the republic. Under the empire, the women wore white, black continuing to be the color for men, who did not cut off the hair or beard as in Greece. Men wore their mourning only a few days; women a year, when for a husband or parent. The time of mourning was often shortened by a victory or other happy public event, the birth of a child, or the occurrence of a family festival. A public calamity, such as a defeat, or the death of an emperor or person of note, occasioned a public mourning, which involved a total cessation of business, called Justitium. In modern Europe, the ordinary color for mourning is black; in Turkey, violet; in China, white; in Egypt, yellow; in Ethiopia, brown. It was white in Spain until 1498. Mourning is worn of different depth, and for different periods of time, according to the nearness of relationship of the deceased. On the death of a sovereign or member of the reigning house, a court mourning is ordered.

MOU'SA, an island of Shetland, remarkable for an object of antiquity styled Burgh-*Mousa,* which consists of a round tower of the class known in the north of Scotland as Pictish towers. Burgh-Mousa occupies a knoll close upon the rocky sea-beach, from which materials for its construction had been taken. The whole fabric is composed of flat slabs of clay-slate, which have been easily piled together in a compact mass without the aid of mortar. In exterior figure, the tower is round, inclining inward about halfway up, and then bulging out near the top. Near the foundation its circumference is 158 ft., and it measures about 40 ft. in height. On the side next the sea, there is a door

way, and that is the only exterior aperture. If there were ever any door-posts, they have disappeared; it is feasibly conjectured, however, that instead of employing a door, the inmates had, on emergencies, built up the opening, for which there is an abundance of loose materials at hand. Entering the doorway, we find the wall 16 ft. thick, and looking upward, feel as if we were at the bottom of a well, for the circular interior has no flooring, and the top is open to the sky. Opposite the doorway, there is an entrance to a passage and stair which wind upward, within the thickness of the wall, to the summit of the building. At different places there are recesses, or galleries, leading off from the stair, lighted by apertures to the interior; such dismal holes being all that we find in the way of apartments. It is customary to speak of an outer and inner wall; but the two walls, if we so distinguish them, are so firmly bound together by the stair and otherwise, as to afford a united resistance to assault. Obviously, the structure was used as a retreat in case of attack from foreign enemies, against whom missiles could be showered down from the species of battlement formed by the top of the well-knit walls. According to tradition, the tower of Mousa was occupied by Erland, a Norwegian jarl, about 1154, when it successfully endured a siege that was undertaken to recover a runaway lady; but how any lady could have found accommodation in such miserable quarters, it is difficult to conjecture. The Society of Scottish antiquaries deserves thanks for having repaired this fine memorial of a former state of society in Shetland. From its comparatively complete state, Burgh-Mousa is a good specimen of the Pictish towers, so called.

MOUSE, *Mus*, a genus of rodent mammalia of the family *Muridæ* (q.v.), having three simple molar teeth in each jaw, with tuberculated summits, the upper incisors wedge-shaped, the lower compressed and pointed, the forefeet with 4 toes and a rudimentary thumb, the hind feet five-toed; the tail long, nearly destitute of hair, and scaly. This genus includes rats (q.v.) and mice; the smaller species bearing the latter name.—The Common Mouse (*M. musculus*) is perhaps not originally American, although now so abundant everywhere. It accompanies man wherever he goes, and readily colonizes every region, arctic, temperate, or tropical; its great fecundity, common also to most of its congeners, causing means to be employed everywhere for the prevention of its excessive multiplication. Aristotle made the experiment of placing a pregnant female mouse in a closed vessel filled with grain, and found in a short time no fewer than 120 mice in the vessel. Of cats and mouse-traps it seems unnecessary here to speak, and equally unnecessary to give a description of the common mouse. There are several varieties of this species. That generally found in houses is smaller, and not so dark in color, as that common in barns and farm-yards. A white variety sometime occurs, and has been perpetuated in a half-domesticated state. The common brown kind is, however, at least as easily tamed, and readily becomes familiar enough. A pied variety is not uncommon in India.—Much has been written about the singing powers of the mouse; it being asserted, on the one hand, that mice not unfrequently show a strong love for music, and a power of imitating the song of birds; whilst, on the other hand, it is alleged that the singing of mice is merely the consequence of throat disease.—The mouse makes a nest like that of a bird in the wainscot of a wall, among the chaff or feathers of a bed, or in any similar situation. The litter is generally from 6 to 10 in number.—The Wood Mouse, or Long-tailed Field Mouse (*M. sylvaticus*), is a little larger than the common mouse. Its tail is longer; its ears are also longer; its muzzle rather longer; its under parts lighter in color than in the common mouse. It is abundant throughout Britain and the temperate parts of Europe, and is a grievous pest in gardens and fields. It lays up stores of grain and other food, either in thick tufts of grass, or just under the surface of the earth. The quantity of food laid up in such stores is often wonderfully large. The field mouse is timid, gentle, and easily tamed.—The smallest British mouse, and the smallest British quadruped, is the Harvest Mouse (*M. messorius*), of which the head and body are only 2¼ in. in length, the tail being almost equally long, and to some degree prehensile; the general form elongated and slender, the head narrow, the ears not large. This species is not uncommon in some parts of the south of England; it is also found in the south of Scotland, although less frequently. It makes its nest among the stalks of wheat, reeds, or other grasses, weaving together the leaves and panicles of grasses, the leaves being for this purpose cut into shreds by its teeth. The nest is a very curious structure formed by mere intertwining, without cement of any kind. It is generally suspended among the stalks. It is globular, or nearly so, and entrance to it is through an opening, which almost completely closes up again.—A still smaller species of mouse (*M. pumilus*) is found in the south of Europe.—An American species, the White-footed Mouse (*M. leucopus*), common in most parts of North America, and intermediate in its habits between the common mouse and the field mouse, is said to depart from houses whenever either the cat or the brown rat appears in them.—The Barbary mouse (*M. Barbarus*) approaches in size to the rats, and is distinguished by its longitudinally striped fur.

The name mouse is often popularly given to animals considerably different from the true mice, as the *voles* (q.v.). See illus., Rodentia, vol. XII.,

MOUSE-EAR CHICKWEED, *Cerastium*, a genus of plants of the natural order *caryophyllaceæ*, having 5 sepals, 5 bifid petals, 10 stamens, 5 styles, and a capsule bursting at the top, with 10 teeth. The species are numerous, natives of temperate and cold coun-

tries in all parts of the world. Some of them are among the most common weeds in Britain; others, having larger flowers, are occasionally planted in flower-borders and on rock-works. The form and hairiness of the leaves of some of the British species have given rise to the popular name.

MOUSSELINE. See MUSLIN.

MOUTH, DISEASES OF THE, occur in different forms, but usually begin with inflammation of the mucous membrane. The inflammation may be equally diffused, or may be chiefly or entirely confined to the mucous follicles. When diffused, it may either present no peculiar secreted product, or the surface may be covered with a curd-like secretion, or with patches of false membrane. It may further be attended with eruption, ulceration, or gangrene, any one of which may impress a special character on the disease, or it may present peculiarities from the nature of its exciting cause, as when it accompanies scurvy, or is the result of mercurial action.

The following are the principal forms of inflammation of the mouth, or *stomatitis* (Gr. *stoma*, the mouth), as it is termed by nosologists. 1. *Common diffused inflammation*, which appears in reddened, somewhat elevated patches, and sometimes occupies large portions of the surface of the mouth. It is more commonly a complication of other diseases than an original affection. When of the latter character, it is generally caused by the direct action of irritants, as by scalding drinks, corrosive substances introduced into the mouth, accumulated tartar on the necks of the teeth, etc. In ordinary cases cooling and demulcent liquids (such as cream or almond oil) applied locally, an occasional saline cathartic, with a soft and chiefly farinaceous diet, constitute the whole of the necessary treatment.

2. *Diffused inflammation, with curd-like exudation*, is almost entirely confined to infants, and is described under its popular name of THRUSH.

3. *Inflammation of the follicles*, and *eruption or vesicular inflammation*, are described in the article apthæ (q.v.).

4. In *ulcerative inflammation, cancrum oris*, or *canker*, an ulceration often of considerable size, with a grayish surface and an inflamed edge, appears on the gums, or inside of the cheeks or lips. The swelling of the adjacent parts is often so considerable as to be apparent externally. There is a copious flow of saliva, and the breath is very offensive. The disease generally occurs in children from 2 to 6 years of age. The ulcer may continue for weeks, or even months, but always yields to treatment. The febrile symptoms and the constipation which are usually present must be combated in the ordinary way. Perhaps the best general method of treating the disease is by the administration of chlorate of potash (4 or 5 grains in sweetened water every 4 hours), and by frequently washing the mouth with a weak tepid solution of chlorinated soda.

5. The preceding affection is sometimes the first stage of a much more serious affection, viz., *gangrene of the mouth*, which usually occurs in children between the first and second dentition. A sloughing ulcer forms upon the gums, or some other part of the mouth. This slough spreads, the breath becomes extremely fetid, the disease extends to the alveolar processes, and the teeth are loosened and fall out. Inability to take food is followed by exhausting diarrhœa, and death is the usual termination. Unless taken in the early stage, when tonics and the local application of caustics may be serviceable, the disease is generally fatal.

Other affections of the mouth are noticed in the articles SALIVATION and SCURVY.

MOVABLE FEASTS. See EASTER; FESTIVALS.

MOVABLES, in Scotch law, is the technical term to denote personal as contradistinguished from heritable property, one of the main distinctions of property being between these two classes. Heritage goes to the heir-at-law in case of intestacy, or what is equivalent to it, and movables go to the next of kin. See KIN. The term movables is thus not confined to corporeal things, as furniture, cattle, goods, etc., but includes debts, bills of exchange, rights of action, etc.

MOVEMENT CURE, a hygienic and therapeutic system for the preservation as well as the recovery of health, introduced by Peter Henry Ling, a native of Smaland, in Sweden, b. 1766. It is a modified form of gymnastics, and being systematized and specially adapted to the treatment of invalids in a reduced condition, possesses, in many respects, additional advantages to those afforded by ordinary gymnastics. The ancient Greeks and Romans, particularly the former, brought the science of gymnastics, in its purely hygienic relations and as adapted to the development of great strength and agility in healthy constitutions, to a great degree of perfection, as is attested by the power they possessed of performing wonderful feats of strength, endurance, and agility. But their Spartan-like processes would, if practiced upon invalids, particularly of the modern type, promote death rather than recovery. It is probable that the ordinary bodily exertions practiced by a normally educated man employed in active business pursuits are, in general terms, sufficient aids to the stimulation of the other functions of the body; but it must be confessed that normally developed and healthy men are exceptional. Civilization, with its competitions, strifes, and various requirements, has imposed restraints which interfere with and prevent normal development. The practice of ordinary gymnastics, or of the ordinary recreations, such as walking, rowing, boxing, horseback

riding, etc., would probably be sufficient for the restoration of functional equilibrium in a person simply jaded by over-work, and this method, because it employs unconscious exertion and perfect relaxation of mind, or essays to do so, is preferable; but, at the same time, it must be acknowledged that in very many cases an individual has formed habits of movement which are more or less abnormal. Many of his muscles, and groups of muscles, from habits formed in the prosecution of his business, have had but very little exercise; they are consequently sluggishly nourished, and do not eliminate effete matter in a manner suited to the requirements of the nerves which enter them, or of the general nervous system with which they are connected. Under such circumstances exercise requires to be systematized more than it is in the rapid and successive movements which take place in ordinary exercise or labor. The man is like a machine out of order: the mere setting in motion of which, if its parts are not completely deranged, will not produce repair. In some instances a patient who might be benefited by partial exercise, would be injured by bringing into action the whole body. These premises being admitted, it will be seen that what is called movement cure can, in many cases where ordinarily healthy persons are undergoing training, be advantageously conjoined with ordinary gymnastics. Ling started a genuine reformation; and he had the approbation of his sovereign in his efforts—a royal ordinance for the establishment of an institution being issued in 1814, and the Swedish government to-day acknowledges the advantages it derives from a governmental institution and from other private establishments of the kind. The natural exercise which is obtained by walking or riding, or moderate gymnastics, ought not to be too readily laid aside for problematic advantages of exercising distinct groups of muscles, unless such a course is very clearly indicated; but, at the same time, it must be borne in mind that many persons have been injured by over-exertion at the gymnasium. Although, as a general rule, unconscious exercise, such as is taken in genuine recreations, is preferable to that which is forced, it is claimed by those who have practiced the movement cure that there are cases in which conscious and directed movements are more beneficial than those which are unconscious; and this is not an unreasonable conclusion, if such movements are performed so as to render the exercise a diversion. One of the principles of the movement cure is that a muscle or a group of muscles shall not be exercised continuously for a long time, but that there shall be an interval or intervals of rest, during which assimilative nutrition takes place better than when the action is prolonged. Blood is drawn to the part, and during the succeeding resting spell the muscles grow, instead of wasting by continued exertion. Those who have an unbalanced muscular development, no doubt, in walking and riding, often over-work the weaker muscles, from the effects of which they afterward suffer discomfort, and miss the securing of the desired harmonious results. When, therefore, it is sought to restore weakened or disused muscles, great care ought to be taken not to overtax them, but to stop short of fatigue; but this is often incompatible with the taking of a walk or a ride of much length. The more correct physiological plan is, in certain cases, to let the general muscular system remain comparatively quiet, while intermittent and moderate movements are made with the special muscles under treatment. This will tend, after a while, to bring them up to a standard sufficient to enable them to take a fair share with the stronger muscles in the general movement of the body, so that by using the latter rather below their capabilities, and the former just enough for theirs, an equilibrium will at last be brought about. To secure this result various devices are practiced, one of the chief principles being that the patient may teach himself, or be taught, how to exercise particular muscles, or sets of muscles, without the aid of any apparatus, but while he is in a natural standing, sitting, or recumbent position. The muscles of the thighs, or of the legs, may be brought into action—and into strong action if it should be desirable—by an effort of the will, and that with scarcely any alteration in the posture. The gluteal muscles are readily brought into action during any position of the body. While lying upon the back, or upon the side, they are readily contracted, and may be held in such a state for any desirable length of time, and at any moment allowed a period of repose for the natural operation of assimilation. This is certainly philosophical practice, and that good results will follow it cannot be denied. The abdominal muscles can very advantageously be set in motion while one is lying upon the back by raising the head from the pillow, and repeating the operation as often as may be thought beneficial. But this exercise is not confined to the abdominal muscles, the pectoral muscles take a certain share, and also the diaphragm; but one peculiar benefit is derived from the stimulus given by the contracted abdomen walls to the involuntary muscles of the alimentary canal, which are usually, in cases calling for this mode of treatment, in a weakened and more or less torpid condition. It is frequently asked why physicians do not more often recommend such practice to their patients. A great part of a physician's duty lies in the treatment of acute diseases, which, as a rule, are not susceptible of cure by movements of the muscular system, and will not, in most cases, admit of such practice without hurtful results. When the body is poisoned by disease germs, as in many of the contagious fevers, there is an unnatural performance of functions which is incompatible with much voluntary motion. Sometimes, indeed, passive motion may be made with benefit, such as gently kneading the bowels, but, as a rule, rest, often absolute rest, is required; and, as the conditions of the disease usually involve the loss of some of the mineral constituents of the body, medicines judiciously adminis-

tered are of great importance. There is no doubt of the efficacy of quinine in the treatment of that poisoned condition engendered by miasm, nor of the beneficial effects attending the use of alkaline medicines in many febrile and inflammatory conditions. Many patients would die of gout and rheumatism but for the action of alkalies, and the almost sovereign power, in many cases of gout, of the plant called colchicum. There are conditions of the system in robust as well as delicate persons, when attacked by acute disease, in which the relief afforded by morphine, or some constituent of opium, would appear to be the only means of saving life. The principal occupation, therefore, of the general practitioner is in prescribing the ordinary therapeutic remedies and attending to those directions which concern the immediate necessities of the patient, such as diet, ventilation of the sick-room, rest and quiet; and there is a temptation to fall into routine habits, but this temptation is not as often yielded to as is supposed, or alleged. Indeed, it is a matter well understood among medical practitioners that, as a rule, it is impossible to prevail upon patients to follow hygienic prescriptions. They are told to ride on horse-back, to walk, to use dumb-bells and Indian-clubs, to go to the gymnasium, or to the movement cure; but they do not obey directions; they have no time. The merchant must attend to his business; his presence is needed on change, and not at the gymnasium, or at the movement cure, or anywhere, dressed in the attire of an athlete, or of an invalid. A lady has a multitude of domestic duties, or, if they are neglected, it is for society and its gayeties, or for pressing demands made upon her for benevolent or charitable work, or for the necessary attentions due to her neighbors and friends. A thousand counter-attractions cause the doctor's injunctions to be disregarded; and is it any wonder that his youthful enthusiasm becomes somewhat modified, and that, after a while, he submits to the necessity of employing such means only as he can carry out to the best advantage? The practice of movement cure is, however, attended with difficulties. There will be an unavoidable tendency to carry speculations and theories to an unwarrantable extent, and to give an indefinite multiplication of movements under an exaggerated idea of their importance, which often results in a want of confidence on the part of the patient in well-established but older methods, and leads him to neglect timely consultation with the general practitioner, or surgeon, in cases requiring active medical or operative surgical interference. On the other hand, there is probably not enough attention paid by many of the medical profession to movement methods of cure in cases of deformities, particularly to those of the spinal column. It would be unjust, however, to infer that such neglect is very prevalent. There are a great many surgeons, who, without calling public attention to their methods of treating deformities, are in the constant practice of deriving aid from muscular and passive movements of all kinds applicable to each particular case. Indeed, such practice furnishes the basis for the brilliant results which attend the practice of modern surgery, many of which are detailed in the history of cases published in numerous medical journals for the special benefit of the profession, and which are seldom seen by the public. See MASSAGE.

MOVERS, FRANZ KARL, 1806–56; b. Koesfeld, Prussia; received his theological education at Münster, where he also pursued the study of the Semitic languages. After being settled for six years over a church in Berkum, he was appointed professor of theology in the university of Breslau, where he remained till his death. His exhaustive work on the Phenicians, *Die Phönizier*, appeared in 4 vols. between 1840 and 1856, and is the standard authority upon its subject.

MOVILLE', a small market t. of Ireland, in the county of Donegal, on lough Foyle, 17 m. n.n.e. of Londonderry. It is a calling-station of the transatlantic steam-packets of the Anchor and Allan lines. Pop. 1500.

MOVING PLANT, *Desmodium gyrans*, a plant of the natural order *leguminosæ*, sub-order *papilionaceæ*, a native of India, remarkable, as are also some other species of the same genus, for the spontaneous motion of the leaves. The leaves are ternate, the lateral leaflets much smaller than the terminal one. These lateral leaflets are in constant motion, being elevated by a succession of little jerks till they meet above the terminal leaflet, and then moving downwards by similar rapid jerks to the leaf-stalk. Sometimes one leaflet is in motion and the other at rest. Sometimes a few may be seen moving, whilst there is a partial cessation in the other leaves of the plant. A high wind causes this cessation more than anything else: the movements are more languid in a very hot dry day, and are to be seen in their perfection in warm moist weather. The terminal leaflet does not remain absolutely at rest, although its movements are not like those of the lateral ones, but oscillates slowly from one side to the other. Concerning these remarkable movements, nothing more than the fact that they take place can yet be said to be known.

MOWATT, ANNA CORA. See RITCHIE.

MOWER, a co. in s.e. Minnesota, adjoining Iowa; drained by the Red Cedar, Upper Iowa, and Root rivers; traversed by the Chicago Great Western and the Chicago, Milwaukee, and St. Paul railroads; 675 sq. m.; pop. '90, 18,019, chiefly of American birth. The surface is mostly prairie land, and wheat is produced in large quantities. Co. seat, Austin.

MOWER, JOSEPH ANTHONY, 1827–70; b. Vt.; received a common education, and learned the trade of a carpenter. He entered the Mexican war as a private in a corps of engineers, and was commissioned as lieutenant of 1st infantry in 1857; appointed captain

in 1861. He fought in the early battles of the civil war in Kentucky and Tennessee; received his appointment as col. of 11th Missouri vols. in May, 1862; was conspicuous in the capture of Island No. 10; severely wounded at the battle of Corinth, Oct. 4, and for a time in the hands of the enemy; promoted to be brig.-gen. in Nov. 1862, and commanded a brigade at Vicksburg, where he displayed great bravery. He rose to the rank of maj.-gen. in 1864, and commanded a division in Louisiana under Gen. Banks; was called to assist Sherman in the Atlanta campaign, and, at the close of the war, was in command of the 20th corps. In 1866 he was appointed col. of 25th infantry, and placed in command in Louisiana, where he remained until his death in New Orleans.

MOWING AND REAPING MACHINES. See REAPING.

MOX'A is a peculiar form of counter-irritation which was early practiced in the east, particularly by the Chinese and Japanese, from whom it was learned by the Portuguese. One or more small cones, formed of the downy covering of the leaves of *artemisia moxa* (as used by the Chinese), or of the pith of various plants (as of the common sunflower), or of linen steeped in niter, are placed on the skin over the affected part, and the ends remote from the skin are ignited. The combustion gradually proceeds through the cone and forms a superficial eschar on the skin. The surrounding parts must be protected by a pad of wet rag, with a hole in it for the moxa.

It may be employed with advantage in certain forms of neuralgia (especially obstinate sciatica) and in paralysis, and in chronic diseases of the joints. It is not much used in consequence of its apparent severity, but the pain is not so great as might be expected, and, according to some of its advocates, is less than often attends blisters. See COUNTER-IRRITANTS.

MOXOS, or MOJOS, a nation of Indians in eastern Bolivia; civilized by the missionary fathers, but now much reduced in numbers and property. They have strong features, intelligent faces, and an independent manner; honest and religious; boatmen on the Mamore, the Madeira, and even to the Amazon. Their language was in contact with the Quichua and Aymara, both of which it resembles. Their early customs show a trace of Guarani influence, and it is probable that they were the farthest tribe in this direction under the control of the Incas.

MOYLAN, STEPHEN, 1734–1811; b. Ireland; emigrated to Philadelphia. Soon after the outbreak of the revolutionary war he went to Cambridge, Mass., where the American camp then was, and was selected by Washington as one of his aids-de-camp. He shortly resigned this office and entered the army as a volunteer. He led the 4th regiment of light dragoons in 1777, taking part in the battle of Germantown. He was attached to Wayne's expedition to Bull's Ferry in 1780, and was with Greene in the south next year. In 1783 he was brevetted brigadier-general. In 1792 and 1793 he was register and recorder of Chester co., Penn., and was afterwards commissioner of the district of Pennsylvania.

MOZAMBIQUE', a colony on the e. coast of South Africa, belonging to Portugal. It extends from Cape Delgado, in lat. 10° 41′ s., to Delagoa Bay, 26° south. The chief river, the Zambesi, divides it into two provinces — Mozambique proper on the n., and Lourenço Marques on the s. Area estimated at 261,700 sq. m.; pop. 1,500,000. These figures, however, are only to be considered approximative, as the country has no definite boundary to the west. The coasts, which comprise large tracts of cultivated soil, yielding rich harvests in rice, are fringed with reefs, islands, and shoals; and between Delagoa Bay and Cape Corrientes, and from Mozambique, the principal station, to Cape Delgado, the shores are high and steep. The forests yield valuable ornamental woods; ivory is obtained from the hippopotami that haunt the marshes; and gold and copper are found and worked. The elephant, deer, and lion inhabit the jungle; crocodiles are found in the rivers, and numerous flamingoes on the coasts. The rainy season lasts from November to March. The summer heat is very great, and the climate, which is fine in the elevated tracts, is unhealthy on the low shores and the swampy districts. Besides numerous fruits and vegetables, the grains are rice, millet, maize, and wheat. For 1894–95 the estimated revenue was £296,857; expenditure, £345,587. The Delagoa Bay railway has a length of 57 miles in the colony and continues for 290 miles to Pretoria. In former times the slave-trade was carried on here extensively; and from 1846 to 1857 four governors-general were removed by their government for countenancing, if not actively engaging in it. The colony is divided into the two provinces above mentioned and is ruled by the royal commissioner, who is appointed for three years and who resides in the capitals of the two provinces alternately. There is a military force and a small navy. Each settlement has its police, courts of justice, etc. Fish and turtle are caught in great quantities on the islands and reefs; pearl-fishing is a source of considerable profit; cattle, sheep, and goats are numerous, and the principal exports are grain, gold-dust, honey, tortoise-shell, cowries, gums, and amber. The Portuguese arrived here in 1497, attracted by rumors of the wealth of the country and the excellence of its ports. The principal parts are Mozambique, Quilimane, Ibo, Chinde, Beira and Lourenço Marques. See illus., AFRICA, vol. I.

MOZAMBIQUE, the capital of the Portuguese colony of the same name, is situated on a small coral island, on the eastern coast of Africa, close to the shore in lat. 15° 2′ south. It is defended by three forts, is well built, and contains a large square, in which

the palace of the governor and the custom-house are the chief buildings. Pop. 8,000. In 1895 the imports at M. were £95,360 and the exports £37,122. In former times all the markets of the world were supplied with slaves from Mozambique. Its commerce, now inconsiderable, is chiefly with India, and is carried on by Arabs.

MOZAMBIQUE CHANNEL, between the island of Madagascar and the south-eastern coast of Africa, is about 950 m. in length, and about 450 in average breadth. At its northern extremity are the Comoro islands. Over the northern portion the monsoons blow.

MOZARABIAN LITURGY, a liturgy—traced back by some to the apostles, but by the majority of writers to St. Isidore of Seville, who redacted it, in co-operation with the fathers of the 4th council of Toledo, 633—originally in use among those Christian inhabitants of Spain (Muzarabians, Mostarabians, Mustarabians) who remained faithful to their religion after the Arabic conquest. It is also called the Gothic liturgy, and differs in some respects from the Roman. Gregory VII. first compelled most of the Spanish churches and convents to adopt the common uniform liturgy of the Romish church. Six Mozarabic congregations alone, chiefly in Leon and Toledo, were allowed to retain their ancient ritual, but it soon fell into disuse even among these. Archbishop Ximenes of Toledo expressly founded a chapel at Toledo, in 1500, in which mass was to be said according to the Mozarabian manner, lest it might entirely fall into oblivion. He further caused a number of learned priests, Alfonso Ortiz among them, to collate all the different Mozarabian liturgical MSS. to be found in the different churches, chapels, and convents, and finally there was edited, under his auspices, the *Missale Mistum secundum Regulam Beati Isidori Dictum Mozarabicum* (1500–2), which has, however, by some unfortunate accident, remained incomplete. A whole third of the church-year is left out entirely. The peculiar affinity of this liturgy with the Gallican on the one, and the Greek on the other hand, makes its study extremely important for the history of the ancient church.

MOZART, Wolfgang Amadeus, composer, b. in Salzburg, Austria, Jan. 27, 1756; d. at Vienna, Dec. 5, 1791. He began to study music under his father, Leopold, learning to play the pianoforte at the age of three. He also wrote music, and studied the violin, and from 1762 to 1769, with his sister Marianne, appeared in public as a prodigy, with great success. At many of the concerts the programmes were made up of the little Mozart's compositions. In 1768 his singspiel, *Bastien und Bastienne*, was given in Vienna, and in 1769 he went with his father to Italy, where he performed his famous feat of writing from memory Allegri's Mass, which he heard sung in Rome. In 1770 he wrote and produced an opera, *Mithridate*, in Milan. In 1773 he went to Vienna, and failed to get a court appointment, and in 1775 traveled to Munich. About this time he gave up violin playing, and from 1775 till 1777 remained in Salzburg, hard at work in composition. He then went to Paris, hoping to get orders for operas, but was unsuccessful. Returning to Salzburg, he was made concert-meister and organist at the court and at the cathedral. In 1781 he went to Vienna, under the patronage of the Archbishop, but was treated with indignity, and abandoned his post to struggle with poverty. His main source of income was composition, but not until his *Marriage of Figaro* was produced did he win popularity. This work, represented in 1786, gave him fame and an order for a second opera, which proved to be *Don Giovanni*, received with enormous success at Prague in 1787. The Emperor Joseph then made him chamber-composer, and kept him in Vienna; but after his death Mozart received little notice from his successor, Leopold II. In 1791 a mysterious order came for him to write a *Requiem*, just as he was starting for Prague, where he had been invited to write an opera for the coronation of Leopold II. On his return to Vienna he finished Die Zauberflöte, and began the Requiem. During its composition he was interrupted by fainting fits, became melancholy, fancied that he had been poisoned, and believed that he was composing his own mass. He died before its completion, and was buried in the common pauper's grave at St. Marx. No trace of his grave has been found, but a monument has been erected there to his memory. Mozart was one of the greatest geniuses in musical history. His precocity ripened into the finest and most versatile musical culture. He combined the characteristics of the Italian and German schools of writing with marvelous skill, and to all his mastery of technical forms he added grace, suavity, gayety, and beauty of sentiment. His finish and perfection of style have never been surpassed. The stories told of his dissoluteness are without foundation. Mozart's operas include: *Mitridate*, Milan, 1770; *Lucio Silla*, ib., 1772; *Idomeneo*, Munich, 1781; *Die Entführung aus dem Serail*, Vienna, 1782; *Der Schauspieldirektor*, Schönbrunn, 1786; *Le nozze di Figaro*, Vienna, 1786; *Don Giovanni*, Prague, 1787; *Cosi fan tutte*, Vienna, 1790; *Die Zauberflöte* (The Magic Flute), ib., 1791, and *La Clemenza di Tito*, Prague, 1791. He also wrote a number of arias; cantatas; church music; 41 symphonies and other orchestral music; concertos for the pianoforte with orchestra; sonatas for the pianoforte, and violin and pianoforte; pianoforte music; organ music with other instruments; songs; and several unfinished works. See Otto Jahn Mozart (2 vols., Leipsic, 1867; in English by Pauline Townsend, 3 vols., London, 1882); Nissen, Mozart; Wurzbach, Mozart-Buch (Vienna, 1869); and Oulibicheff, *Nouvelle biographie de Mozart* (Moscow, 1844).

MOZDOK, a dist. t. of Russia, in the government of Terek, 50 m. n. of Vladikavkaz, on the river Terek. Pop. '91, 13,000.

The *respiratory mucous membrane* begins at the nostrils, and under the name of *schneiderian* or *pituitary membrane*, lines the nasal cavities, from whence it sends on either side an upward prolongation through the lachrymal duct to form the *conjunctiva* of the eye; backwards, through the posterior nares (the communication between the nose and the throat), it sends a prolongation through the Eustachian tube to the middle ear (the cavity of the tympanum), and is continuous with the pharyngeal mucous membrane (which is a portion of the alimentary tract); it then, instead of passing down the œsophagus, enters and forms a lining to the larynx, trachea, and bronchial tubes to their terminations. From the continuity of these two tracts, some writers describe them as a single one, under the name of the gastro-pulmonary tract.

The *genito-urinary mucous membrane* commences at the genito-urinary orifices, lines the excretory passages from the generative and urinary organs, and is the essential constituent of the glands of both. See KIDNEYS, for example.

We thus see that mucous membranes line all those passages by which internal parts communicate with the surface, and by which matters are either admitted into or eliminated from the body. As a general rule, they are soft and velvety, and of a more or less red color, from their great vascularity, but they present certain structural peculiarities according to the functions which they are required to discharge. In all the principal parts of the mucous tracts we find the mucous membrane to present an external layer of epithelium (q.v.) resting on a thin, transparent, homogenous membrane, which from its position is termed the *basement membrane*, and beneath this a stratum of vascular tissue of variable thickness, which usually presents either outgrowths in the form of papillæ and villi, or depressions or inversions in the form of follicles or glands, or both. The follicles are almost invariably present, but the papillæ and villi are limited to the alimentary or gastro-intestinal mucous membrane. "The mucous membranes," says Dr. Carpenter, "constitute the medium through which nearly all the material changes are effected that take place between the living organism and the external world. Thus, in the gastro-intestinal mucous membrane we find a provision for reducing the food by means of a solvent fluid poured out from its follicles; whilst the villi, or root-like filaments, which are closely set upon its surface towards its upper part, are specially adapted to absorb the nutrient materials thus reduced to the liquid state. The same membrane, at its lower part, constitutes an outlet through which are cast out not merely the indigestible residuum of the food, but also the excretions from numerous minute glandulæ in the intestinal wall, which result from the decomposition of the tissues, and which must be separated from them to prevent further decay. Again, the bronchio-pulmonary, or respiratory mucous membrane, serves for the introduction of oxygen from the air, and for the exhalation of water and carbonic acid. And, lastly, the mucous membranes are continuous with the cell-lined vesicles or tubes of the various glands, which are the instruments whereby their respective products are eliminated from the blood." Although the various kinds of epithelial cells discharge a special office in relation to the peculiar function of the mucous membrane upon which each kind occurs, yet they all serve one general purpose—namely, that of protecting the surfaces on which they are placed. This protecting power is increased by the presence of the secretion known as *mucus*, which ordinarily forms an extremely thin layer on these membranes, but when they are irritated or inflamed, is secreted in very considerable quantity. The exact mode of its formation is still a disputed question, but it is generally believed to be the product of the gradual solution of the uppermost epithelial cells. Besides acting both mechanically and chemically as a shield to highly sensitive membranes, it has other uses, amongst which two may be especially mentioned.—1. It communicates to the salivary, and probably to other glands, properties which are not possessed either by itself or by the pure glandular secretions; and 2. It serves to eliminate a considerable quantity of nitrogen from the system. This nitrogen is contained in the *mucin*, which forms from 2.4 to 9 per cent of nasal and bronchial mucus. This mucin contains 12.64 per cent of nitrogen, and is the substance which gives to mucus its viscid and tenacious character. Normal mucus is devoid of smell and taste, and almost, if not quite, neutral; and hence its constant presence in the mouth gives rise to no disagreeable sensation.

MU'DAR, *Calotropis*, a genus of shrubs of the natural order *asclepiadaceæ*, distinguished by a coronet of fine blunt processes adhering to the base of the filaments. They are natives of the East Indies, and the bark of the root, and the inspissated milky juice of some of them, are much used there as an alterative, purgative, emetic, and sudorific medicine. The medicinal properties of mudar have been well known in India for many centuries, and have begun to attract the attention of European physicians. It is found of great value in elephantiasis, and in leprosy and other obstinate cutaneous diseases, as well in some spasmodic affections, and in syphilis.—The species most common in the south of India is *C. gigantea;* in the north, *C. Hamiltonii;* whilst *C. procera*, said to have an extremely acrid juice, extends into Persia, and even into Syria. Mudar is very common in India, springing up in uncultivated ground, and often troublesome in that which is cultivated. It is a large shrub, with stems often thicker than a man's leg; and broad fleshy leaves. It grows where almost nothing else will, on very dry sands, and rapidly attains a large size. The silky down of the pods is used for making a soft, cotton-like thread; but is short, and not easily spun. The inner bark also yields a strong

and useful fiber, which makes excellent cordage and fishing-lines; but the mode of preparation hitherto used makes it costly.—The inspissated milky juice of mudar collected by making incisions in the bark, is used as a substitute for caoutchouc and gutta-percha. It becomes flexible when heated.—The mudar of medicine contains a principle called *mudarine*, on which its medicinal virtues are supposed to depend, and which possesses the rare property of gelatinizing when heated, and becoming fluid when again cooled.

MUD EEL. See SIREN.

MUD-FISH, *amia*, a very curious genus of fishes, forming the family *amiidæ*, of the order *ganoidei* of Müller, although its position among the *ganoidei* is determined only by anatomical characters, in which it agrees with sturgeons and the rest of that order, for the scales are not ganoid, and are not osseous plates, but are flexible and rounded, and destitute of enamel. Similar scales, however, are found in fossil genera regarded by Agassiz as ganoid. In habit the mud-fish resembles osseous fishes rather than ganoids. Except in the absence of teeth on the tongue, the mouth resembles that of a trout. The body is long and flexible, with a bony vertebral column; there are two nasal cirri; the head is flat, covered with a very thin mucous skin, immediately under which the bones appear as sculptured plates. More than ten species are known, natives of the fresh waters of America. The WESTERN Mud-fish (*A. calva*) is from a foot and a half to three feet long, bluish-black above, white below. It inhabits the great northern lakes of North America, and is found as far s. as Carolina. It feeds chiefly on crawfish and other crustaceans. It is not esteemed as an article of food, although sometimes used by the Indians.

MUDGE, BENJAMIN FRANKLIN, b. Me., 1817; graduated at Wesleyan university, 1840; afterwards studied law and practised in Lynn, Mass., for several years. He became interested in the coal-oil and petroleum trade in Kentucky; was state geologist of Kansas in 1864–65; and the professor of natural sciences in the Kansas agricultural college. He has made several paleontological discoveries. He d. in 1879.

MUDGE, ENOCH, 1776–1850; b. Lynn, Mass., one of the pioneers of Methodism in New England. He entered the church at the age of fifteen, the Methodist ministry in 1793; traveled and preached in Maine in 1796; resided in Orrington, Me., and was twice chosen state representative. Subsequently he re-entered the itinerancy, and was stationed in Boston. In 1832 he was appointed chaplain to the Seamen's Bethel, New Bedford, where he labored with great success until 1844, when on account of ill-health he retired from the ministry. He was highly esteemed as a preacher.

MUD-HEN. See COOT.

MUD'KI, usually spelled MOODKEE, a village of British India, 28 m. s.e. of the Sutlej, and 64 m. s.s.e. of the city of Lahore, on the Ravi. It has a pop. of about 5,000. Here the first battle in the Sikh war of 1845–46 was fought (Dec. 18, 1845), when the British under sir Hugh Gough repulsed the Sikhs, and sir Robert Henry Sale, "Fighting Bob," was killed.

MUĔD'DIN (*Muëzzin*), the Arabic name of the Mohammedan official attached to a mosque, whose duty it is to announce the different times of prayer. His chant (adan) consists of these words, repeated at intervals: "Allah is most great. I testify that there is no God but Allah. I testify that Mohammed is the apostle of Allah. Come to prayer. Come to security." ["Prayer is better than sleep" is added in the morning, at the subh or fegr. See MOHAMMEDANISM.] "Allah is most great. There is no deity but Allah!" Besides these regular calls, two more are chanted during the night for those pious persons who wish to perform special nightly devotions. The first (ula) continues, after the usual adan, in this manner: "There is no deity but Allah! He hath no companion—to him belongeth the dominion—to him belongeth praise. He giveth life, and causeth death. And he is living, and shall never die. In his hand is blessing, and he is almighty," etc. The second of these night-calls (ebed) takes place an hour before daybreak, and begins as follows: "I extol the perfection of Allah, the existing for ever and ever: the perfection of Allah, the desired, the existing, the single, the supreme," etc. The office of a muëddin is generally entrusted to blind men only, lest they might, from their elevation, have too free a view over the surrounding terraces and harems. The harmonious and sonorous voices of the singers, together with the simplicity and solemnity of the melody, make a strikingly poetical impression upon the mind of the hearer in daytime; much more, however, is this the case whenever the sacred chant resounds from the height of the mosque through the moonlit stillness of an eastern night.

MUEZZIN. See MUËDDIN.

MUFTI (Arabic, *expounder of the law*). The Turkish grand mufti is the supreme head of the ulemas (servants of religion and laws), and has, together with the grand vizier (vizier azim), the supreme guidance of the state, nominally ruled by the sultan. His is the chief spiritual authority, and in this capacity he is also denominated sheikh-al-Islam (lord of the faith). The imams (priests), however, chosen from the body of the ulemas, are, from the moment of their official appointment, under the authority of the kislaraga, or chief of the black eunuchs. The better class of the ulemas are the teachers and

The *respiratory mucous membrane* begins at the nostrils, and under the name of *schneiderian* or *pituitary membrane*, lines the nasal cavities, from whence it sends on either side an upward prolongation through the lachrymal duct to form the *conjunctiva* of the eye; backwards, through the posterior nares (the communication between the nose and the throat), it sends a prolongation through the Eustachian tube to the middle ear (the cavity of the tympanum), and is continuous with the pharyngeal mucous membrane (which is a portion of the alimentary tract); it then, instead of passing down the œsophagus, enters and forms a lining to the larynx, trachea, and bronchial tubes to their terminations. From the continuity of these two tracts, some writers describe them as a single one, under the name of the gastro-pulmonary tract.

The *genito-urinary mucous membrane* commences at the genito-urinary orifices, lines the excretory passages from the generative and urinary organs, and is the essential constituent of the glands of both. See KIDNEYS, for example.

We thus see that mucous membranes line all those passages by which internal parts communicate with the surface, and by which matters are either admitted into or eliminated from the body. As a general rule, they are soft and velvety, and of a more or less red color, from their great vascularity, but they present certain structural peculiarities according to the functions which they are required to discharge. In all the principal parts of the mucous tracts we find the mucous membrane to present an external layer of epithelium (q.v.) resting on a thin, transparent, homogenous membrane, which from its position is termed the *basement membrane*, and beneath this a stratum of vascular tissue of variable thickness, which usually presents either outgrowths in the form of papillæ and villi, or depressions or inversions in the form of follicles or glands, or both. The follicles are almost invariably present, but the papillæ and villi are limited to the alimentary or gastro-intestinal mucous membrane. "The mucous membranes," says Dr. Carpenter, "constitute the medium through which nearly all the material changes are effected that take place between the living organism and the external world. Thus, in the gastro-intestinal mucous membrane we find a provision for reducing the food by means of a solvent fluid poured out from its follicles; whilst the villi, or root-like filaments, which are closely set upon its surface towards its upper part, are specially adapted to absorb the nutrient materials thus reduced to the liquid state. The same membrane, at its lower part, constitutes an outlet through which are cast out not merely the indigestible residuum of the food, but also the excretions from numerous minute glandulæ in the intestinal wall, which result from the decomposition of the tissues, and which must be separated from them to prevent further decay. MUFTI (Arabic, *expounder of the law*). The Turkish grand mufti is the supreme head of the ulemas (servants of religion and laws), and has, together with the grand vizier (vizier azim), the supreme guidance of the state, nominally ruled by the sultan. His is the chief spiritual authority, and in this capacity he is also denominated sheikh-al-Islam (lord of the faith). The imams (priests), however, chosen from the body of the ulemas, are, from the moment of their official appointment, under the authority of the kislaraga, or chief of the black eunuchs. The better class of the ulemas are the teachers and

expounders of the law, from among whom the mollahs and cadis are elected. The Turkish laws have their basis in the Koran; the mufti thus, as head of the judges, acquires a spiritual authority. His also is generally the office of girding the sultan with the sword at his ascension to the throne, a ceremony which takes place at the mosque of Eyub, and which is equal to our ceremony of coronation. The mufti is elected and may be deposed by the sultan, and his position has in modern days lost much of its former dignity and importance. His fetwa, or decision, although attached to the imperial decrees, imparts to it but little additional weight. Nor is his own dictum in things spiritual always considered as finally binding. The only prerogative of muftis and ulemas which has hitherto remained untouched is their being exempt from bodily or otherwise degrading punishments; nor can their property ever be confiscated, but descends to their successors.

MÜGGE, Theodor, 1806–61, b. Berlin. After devoting himself in early life to mercantile pursuits, at the age of nineteen he started for Peru to serve as a soldier with Bolivar. The news of the expulsion of the Spaniards reached him in London, and he returned to Berlin, where he studied history, philosophy, and the sciences, but lost his chances for a university professorship by the publication in 1831 of *France and the Last of the Bourbons* and *England and Reform.* His ultra-liberal sentiments, expressed in various newspapers and in his pamphlet *Die Censurverhältnisse in Preussen,* led in several instances to his arrest and political prosecution. He was associated with the staff of the *Zeitung für die Elegante Welt,* and for some time edited the *Nationalzeitung,* the only liberal journal of Prussia. In 1850 he began the publication of an annual, entitled *Vielliebchen.* During the twenty years preceding his death he poured forth a constant succession of sketches, tales, novels, and romances. His collected works amount to thirty-three volumes. The best-known of his later writings are *The Provost of Sylt, Christmas Eve, The Oldest Son of the Family,* and the posthumous romance *The Prophet.* He died in his native city of Berlin, where he occupied a prominent position.

MUGGLETO'NIANS, a sect that arose in England about the year 1651, and of which the founders were John Reeve and Ludovic Muggleton (b. 1607, died 1697), obscure men, but who claimed to have the spirit of prophecy. Muggleton was a journeyman tailor. He professed to be the "mouth" of Reeve, as Aaron was of Moses. They affirmed themselves to be the *two witnesses* of Rev. xi. They asserted a right to curse all who opposed them, and did not hesitate to declare eternal damnation against their adversaries. They favored the world with a number of publications, one of which—particularly directed to the parliament and commonwealth of England, and to his excellency the lord gen. Cromwell—was entitled a *Remonstrance from the Eternal God.* The prophets were at that time imprisoned as nuisances "in old Bridewell." Another publication was a *General Epistle from the Holy Spirit,* dated from "Great Trinity lane, at a chandler's shop, over against one Mr. Millis, a brown baker, near Bow Lane End, London." [The first complete edition of Muggleton's works was published in 1756; another edition appeared in 1832.] The Muggletonians denied the doctrine of the trinity; they held anthropomorphist opinions; and to all this they added many strange doctrines of their own, as that the devil became incarnate in Eve, etc. The Muggletonians existed in England as a sect till more than one-fourth of the 19 c. had passed away; but the census of 1851 showed no trace of them, and they are supposed to be now completely extinct.

MUGIL'IDÆ. See Mullet.

MUGWUMP, a word borrowed from the language of the Algonquin Indians, the original form of it being *mugquomp,* meaning "chief," "leader," "duke," "great man," and used by John Eliot (q.v.) in his Indian Bible, in Genesis xxxvi., 40–43; II. Samuel xxiii.; and Matthew vi., 21. It passed into the local phraseology of some of the New England villages, being applied to any local magnate. Its first appearance in print seems to have been in a heading of the *Indianapolis Sentinel,* in 1872, there employed by the editor, Mr. H. F. Keenan, who had heard the expression in New England. Its popular use began with an article in the *New York Sun* for March 23, 1884, where it still retains its early meaning of "a local magnate." In September of the same year it was first given to a political party—the Independent Republican—who refused to ratify the nomination of Mr. Blaine for the presidency. The name was applied to them in a spirit of derision, as to those who thought themselves greater and better than their fellows, but was accepted by them, and now regularly denotes any body of voters that profess to be independent of strict party obligations. See Party Names.

MÜHLBACH, Luise. See Mundt, Klara (Müller).

MÜHL'BERG, a t. of Prussia, prov. of Saxony, situated on the Elbe, 22 m. n.n.w. of Meissen. Pop. '90, 3441. Here on April 24, 1547, a battle was fought between Johann-Friedrich, elector of Saxony, and the emperor Charles V.—a battle fraught with the most important results to the cause of Protestantism in Germany. The battle was soon decided in favor of the emperor, Johann-Friedrich was taken prisoner, and his territories were handed over to Maurice, the representative of the ducal family of Saxony. From this time till 1552 the Catholics were triumphant in Germany.

MÜHLENBERG, Frederick Augustus, 1750–1801; b. Penn.; was the son of the Rev. H. M. Mühlenberg; educated at the university of Halle; and afterwards became a

Lutheran minister in New York city. In 1779–80 and 1789–97 he was a member of congress from Pennsylvania. He was twice elected speaker of the house of representatives.

MUHLENBERG, Gotthelf Heinrich Ernst, d.d., 1753–1815; b. Penn., entered the university of Halle at ten years of age, where he remained seven years; afterwards traveled in Germany and England; then returned to America, was ordained a Lutheran minister and became assistant pastor of a Lutheran church in Philadelphia, of which his father, Heinrich Melchior Muhlenberg, the founder of the German Lutheran church in America, was pastor. In 1777, during the occupation of Philadelphia by the British, he retired to the country, where he devoted himself to the study of botany; and it is as a botanist that he is best known. His chief works are, *Catalogus Plantarum Americæ Septentrionalis*, and *Descriptio Uberior Graminum*.

MUHLENBERG, Heinrich Melchior, d.d., 1711–1787; b. Einbeck, Prussia, then a free city of Germany. His parents were Saxon, but having suffered greatly in the thirty years' war removed to Einbeck. His father was a member of the city council, and held a judicial appointment. His mother was the daughter of a retired officer, and a woman of sense, energy, and piety. By them the son was religiously trained. The death of his father occasioned an interruption of his studies. His early life was one of privation and toil. From his 12th to his 21st year he toiled incessantly to assist in the support of the family, yet improved every leisure hour for mental culture and the acquisition of knowledge. At the age of 21 he became tutor in the school of Raphelius at Zelleafeld. In 1735 he entered the university of Göttingen, where he remained three years. The influence of Dr. Oporin, who received him into his family, and employed him as an amanuensis, was excellent, and from that time he became an active Christian. Graduating at Göttingen he went to Halle, where, besides studying he taught in the orphan house. He associated intimately with Francke, Cellarius, and Fabricius. By their advice he decided to prepare for the missionary work, and Bengal was selected as the field of his operations. Soon after his ordination, and while making arrangements for his departure to India, application came from Pennsylvania to Germany for some one to be sent to labor among the destitute of that colony. The faculty immediately selected Muhlenberg, who was then in his 31st year. He reached America in 1742, to the great joy of the German Christians. He found the church in a deplorable condition, the Lutheran population having been much neglected. His arrival marked a new era in the history of the Lutheran church in the United States, its condition gradually improved, and frequent accessions were made to the ranks of the ministry, of men educated at Halle, and thoroughly devoted to their work. He took the pastoral care of the associated churches of Philadelphia, New Hanover, and Providence, which had united in calling a minister, and these three congregations were the principal scenes of his ministerial labors, though he preached in all the Lutheran churches of his day, and his aid was often requested from neighboring churches whose differences he seldom failed to reconcile. He often made long journeys to gather the scattered flock, preach the word, administer the sacraments, introduce salutary discipline, and perform other kind services. His influence was unbounded. The first three years of his ministry he resided in Philadelphia, the next 16 in Providence. In 1776 he resumed his charge in the country. During the war of the revolution his sympathy with the colonists excited great opposition, and his life was often in peril. Though advised to remove into the interior from the scene of hostilities, he refused. He was extensively known, and his views were well understood. Many of all classes, taking advantage of his position resorted to his house. "His home," says a contemporary, "was constantly filled with fugitives, acquaintances, and strangers, with the poor and hungry, noble and common beggars. The hungry never went away unsatisfied, nor the suffering uncomforted." At his death there was deep and widespread sorrow. In many places the bells were tolled, the churches shrouded in mourning, and funeral sermons delivered. Dr. Muhlenberg was a man of rare excellence. He possessed a combination of qualities which eminently fitted him for the duties to which he was called. Gifted by nature with great mental powers which were highly cultivated, he devoted himself fully to the fulfillment of his mission. His society was sought by the learned men of the day. The university of Pennsylvania conferred upon him the doctorate in divinity, rarely conferred in those days, and only upon those of unquestioned distinction. He d. at Trappe, Penn.

MUHLENBERG, Henry Augustus, 1782–1844; b. Penn.; pastor of a Lutheran church, 1802–08. He was a member of congress, 1829–38, serving on a number of the principal committees. In 1835 he was an unsuccessful candidate for governor on the democratic ticket. He was offered by President Van Buren the Russian mission, and the post of the secretary of the navy, both of which he refused. In 1838 he accepted the Austrian mission, which he held until 1840.

MÜHLENBERG, John Peter Gabriel, 1746–1807; b. Penn.; son of Dr. Henry M. He was educated at the university of Halle, from which he ran away, and passed a year as a private in the dragoons. Returning to America, 1766, he studied for the Lutheran ministry; was called to Virginia, 1771; to have a legal standing as a clergyman there, went to England, 1772, and was ordained by the bishop of London; in same year was settled at Woodstock, Va. Soon after the beginning of the revolutionary war, he told his congregation that there was a time to preach and a time to fight, and at the close of the services, he tore off his gown,

showing himself in full uniform, and read from the pulpit his commission as colonel. He had the drummers strike up for volunteers, and many of his congregation volunteered and joined his regiment, the 8th Virginia, popularly known as the German regiment, afterwards noted for its courage and good discipline. In 1774 he was a member of the house of burgesses, and served on the committee of safety, and two years later he sat in the state convention. He participated in the fighting at Charleston in 1776, and was made brigadier-general the following year, and placed in command of the Virginia line. He took part in the battles of Brandywine, Germantown, and Monmouth, and in the capture of Stony Point. He defended Virginia against the expeditions of Leslie and Arnold, and was commander-in-chief there till the arrival of Steuben. Upon the invasion of Virginia by Cornwallis, he was next in command to Lafayette, and at the siege of Yorktown he was in command of the 1st brigade of light infantry. He retired at the close of the war with the rank of major-general. Soon after, he settled in Pennsylvania, to whose executive council he was at once elected, and of which he was elected vice-president in 1785. He served in Congress in 1789–91, 1793–95, and 1799–1801. In the latter year he was elected U. S. senator, and in 1803 he was appointed collector of the port of Philadelphia.

MUHLENBERG, William Augustus, d.d., 1796–1877; b. Philadelphia; graduated at the university of Pennsylvania, 1814; ordained a minister of the Protestant Episcopal church in 1817; in 1817–21 assistant rector of Christ's church, Philadelphia, under bishop White; was rector of St. James's church, in Lancaster, Penn., 1821–28. Here he took an active part in establishing the first public school in the state out of Philadelphia. In 1828 he founded at Flushing, L. I., a school, afterwards called St. Paul's, and of which he was the principal until 1846. In 1846–58 he was rector of the church of the Holy Communion in New York, the earliest free Episcopal church. In 1858 he became superintendent and pastor of St. Luke's hospital, in New York, of which he was the founder. He had organized in 1845 the first Protestant sisterhood in the United States, which afterwards was in charge of this hospital. In the latter years of his life he was instrumental in founding an industrial Christian settlement at St. Johnland, L. I., near New York. He was an earnest advocate of Christian union. He was the author of the popular hymns, "I would not live alway," "Like Noah's weary dove," "Shout the glad tidings," and "Saviour who Thy flock art feeding." He published *Church Poetry, being portions of the Psalms in verse, and hymns suited to the festivals and fasts, from various authors; Music of the Church,* in connection with bishop Wainwright; and the *People's Psalter.* He was a bright example of the mingling of earnest practical philanthropy with fervid devotion, and is held in honor by Christians of every name.

MUHLENBURG, a co. in w. Kentucky, intersected by the Chesapeake, Ohio, and Southwestern, the Louisville and Nashville, and other railroads; 484 sq. m.; pop. '90, 17,955, chiefly of American birth, includ. colored. The Green river forms its n.e. boundary, the Muddy river its e., and a branch of the Green river its w. boundary. Its surface is hilly and well wooded, containing beds of bituminous coal and iron ore, which are extensively mined. Its soil is very productive, and adapted to tobacco, cotton, every kind of grain, and the raising of live stock. It has saw and grist mills, and tobacco factories. Co. seat, Greenville.

MÜHLHAUSEN, in Alsace-Lorraine. See Mülhausen.

MÜHLHAU'SEN, a t. of Prussia, prov. of Saxony, capital circle of M., on the Unstrut, 30 m. n.w. by w. of Erfurt. It ranked in the middle ages as an important imperial free city, and is still an active center of commerce. It has manufactories for linen and woolen goods, starch, anise, and saffron works, and carpet and leather factories. Pop. '90, 27,400. Mühlhausen was deprived of its municipal independence in 1803, and made over to Prussia, with which it has since remained ineorporated, excepting for a short period during the predominance of French influence in Germany, when, at the suggestion of Napoleon, it was included in the kingdom of Westphalia, but it was restored to Prussia in 1813.

MÜHL'HEIM, the name of two manufacturing towns of Rhenish Prussia, distinguished from each other as *M. an der Ruhr* and *M. am Rhein.* The former, situated on the river Ruhr, 16 m. n. of Düsseldorf, is a flourishing town, chiefly important on account of its trade in Ruhr coal. Excellent river-steamers are built here. Sandstone is extensively quarried, and iron-works and machine-factories are in operation. Cotton-spinning, weaving, printing, tanning, and paper-making are carried on. Pop. '90, 27,903. *M. am Rhein,* nearly opposite Cologne, carries on extensive manufactures of silk goods; there are dye works and paper and oil mills in operation, and considerable trade and commerce. Pop. '90, 30,996.

MUIR, John, b. Glasgow, 1810; educated in the university of Glasgow, and at the East India school at Haileybury, and engaged in the civil service in British India in 1828–53. He devoted himself to the study of Indian languages, history, and antiquities, and wrote religious tracts in Sanskrit verse. In 1853 he retired from the service and after that time he devoted his time and fortune to the advancement of oriental litera-

ture, especially in its bearing upon Christianity. Having, in 1846, offered to the university of Cambridge a prize of £500 for the best treatise on the errors of the Hindu systems of philosophy, and expounding the principles of Christianity to learned natives of India, he gave, in 1862, £5,000 to the university of Edinburgh for the endowment of a professorship of Sanskrit and comparative philology. Muir did much to help the spread of Christianity among the Hindus. He not only contributed to the transactions of Asiatic and other learned societies, but published *Original Sanskrit Texts on the Origin and History of India, their Religion and Institutions*, 5 vols., a work of much learning and very useful to the students of Sanskrit and Indian literature. He d. 1882.

MUIR, Sir WILLIAM, b. at Glasgow, 1819; studied at the universities of Glasgow and Edinburgh, and in 1836 went out to India, and entered the civil service, in which he rose to high distinction. He also became eminent as an orientalist. In 1885 he was appointed principal of the university of Edinburgh. He wrote, besides other works, a *Life of Mahomet and History of Islam* (1858, 4th vol., 1861; abridged edition, 1871); *The Coran* (1878); *The Early Caliphate* (1881); *Mahomet and Islam* (1884), etc.

MUKDEN', or MOUKDEN, in lat. 41° 50′ 30″ n., long. 123° 37′ e., the capital of Shêngking, the chief province of Manchuria. Its Chinese name is Tungtien-foo, signifying *affluent capital*, a translation of the Manchu Moukden, meaning *flourishing*. It lies on a branch of the river Liao, about 500 m. n.e. of Peking. The town is surrounded by a wall about 10 m. in circumference, including an inner wall 3 m. in circuit, inclosing the emperor's summer residence. Great pains have been taken by the emperors to enlarge and beautify this the metropolis of the Manchu race, but with only partial success. The family residence and place of sepulture of the founders of the reigning dynasty is Hingking, about 60 m. e. of Mukden. It is pleasantly situated in a mountain valley near the palisade which separates the province from Kirin. The emperor Kienlung rendered himself celebrated among his subjects, and the city of Mukden better known abroad by a poetical eulogy upon the city and province, which was printed in 64 different forms of Chinese writing. In 1631 Mukden became the seat of government of the Manchu emperors, and is now the seat of several superior tribunals of a Chinese viceroy of the first rank. Nineteen leagues from Mukden is its port, Niuchwang, or Newchwang (more correctly known as Ying-tz, i.e., "camp" or "military station"), which has been opened recently to foreign commerce. It is shallow, difficult of access, and during many months of the year closed by ice. Pulse, cattle, and drugs are its chief exports.

MUKHTAR PASHA, b. in Turkey, 1832, and generally believed to have been a natural son of the sultan, Abdul Medjid. He was educated at the Constantinople military school; was rapidly promoted and became successively professor and governor of the school. In 1862 he served as a staff officer in the Montenegrin campaign, and subsequently in minor troubles with the Arabs. At the breaking out of the Bosnian insurrection he was made governor-general of Bosnia and Herzegovina, where he had some success, but incurred a severe defeat at Duja Pass, and in the Montenegrin campaigns of 1876 had, on the whole, but small success. In 1877 Mukhtar had charge of the campaign against Russia in Asiatic Turkey, and on April 29 was defeated and driven from Kars; but in a number of severely contested battles during the next two months, his troops displayed great courage and regained the position. On Oct. 11, the Russians gained an important victory over Mukhtar, driving him back to Kars, and soon afterwards to Erzeroom. The fall of Kars practically decided the war, and before the end of the year Mukhtar was recalled, and replaced by Ismail Kurd Pasha.

MULA, a town in the province of Murcia, Spain, is situated on a branch of the Segura, about twenty-two miles west of the city of Murcia. The town itself is unimportant, but has some reputation from the warm sulphurous baths known as Baños de Mula some three miles east of the town. Pop. (commune), 10,800.

MULATTO. See MIXED RACES.

MULBERRY, *Morus*, a genus of trees of the natural order *moraceæ*, natives of temperate and warm climates, with deciduous leaves, unisexual flowers in short, thick spikes, a 4-parted perianth, containing either four stamens or one pistil with two styles, the perianth of the female flowers becoming succulent and closing over the small pericarp, the whole spike coalescing into an aggregate fruit.—The COMMON MULBERRY, or BLACK MULBERRY (*M. nigra*), is a native of the middle parts of Asia, but was introduced into the s. of Europe more than a thousand years ago, and is now almost naturalized there. It is a low tree, much branched, with thick rough bark and broad heart-shaped leaves, which are unequally serrated and very rough. It is cultivated in the middle parts of Europe, and succeeds well in the s. of England, but in the northern parts of Britain it requires a wall. The perianth and stigmas are roughly ciliated, and the fruit is of a purplish-black color, with dark red juice, fine aromatic flavor, and subacid sweet taste. The fruit is much esteemed for dessert; an excellent preserve and a pleasant light wine are made of it. The tree often produces its fruit in prodigious quantity. The wood is employed in cabinet-work, but is not of much value. The leaves are sometimes used for feeding silk-worms. The black mulberry lives long; trees still existing in England are known to be more than 300 years old. It is propagated by seed, by suckers, by layers, or by cuttings. It succeeds best in a rich light soil.—The WHITE MULBERRY (*M. alba*)

is a native of China, and has been there planted from time immemorial for the sake of its leaves, which are the best food for silk-worms; on which account also it has been cultivated in the s. of Europe since about 1540. In North America it does not succeed further n. than lat. 43°, being somewhat more impatient of frost than the black mulberry. The perianth and stigmas are smooth; the fruit is almost white, and is much less palatable than that of the black mulberry, although in this respect there is great difference among the many varieties. A rob made of it is useful in sore throat. The best variety for feeding silk-worms, on account of its rapid growth and abundant leaves, is that called the PHILIPPINE MULBERRY. In India the white mulberry is treated as a bush, and cut down twice a year; the shoots, stripped of their leaves, being thrown away, although the bark has long been used in China and Japan for making paper. It grows readily from cuttings. The root has a considerable reputation as a vermifuge.—The RED MULBERRY (*M. rubra*), a native of North America, abounding particularly on the lower parts of the Missouri, endures severe frosts much better than either of the preceding, and is therefore preferred for cultivation in some parts of Europe. Its fruit is deep red, and almost as pleasant as the black mulberry. The wood is much more valuable; being fine-grained, strong, and adapted even for ship-building. The tree attains a height of 60 ft. or more.—The INDIAN MULBERRY (*M. Indica*) has black fruit of a delicate flavor, and the leaves are extensively used for feeding silk-worms in China, Cochin-China, and Bengal.—*M. atro-purpurea* has been introduced into India from China for feeding silk-worms. *M. Mauritiana*, a native of Madagascar and Mauritius; *M. celtidifolia* and *M. corylifolia*, Peruvian species; *M. Tatarica*, a native of Central Asia; *M. lævigata*, the species most common in the n. of India; and *M. Cashmeriana*, a native of Cashmere, produce pleasant fruit; M. *dulcis*, a native of the n. of India, is said to be superior in flavor to all others.

The PAPER MULBERRY (*Broussonetia papyrifera*) differs from the true mulberries in having the female flowers collected in a globular mass. The tree is of moderate size, or, in cultivation, a bush of 6–12 ft. high; with leaves either simple or lobed, a native of India, Japan, and the islands of the Pacific ocean, but now not uncommon in pleasure-grounds in Europe and North America. The islanders of the Pacific cultivate the paper mulberries with great care. They make a kind of clothing from the bark, using for this purpose the bark of small branches about an inch in diameter, which they macerate in water, and then, scraping off the epidermis, press and beat the moist slips together. The paper also, which is used in Japan and many parts of the east, is in great part made from the bark of the young shoots of this plant, which for this purpose is boiled to a pulp, and treated somewhat in the same way as the pulp of rags in Europe. When the shoots are cut, new ones spring up very rapidly.—Silk-worms eat the leaves of the paper mulberry. —The fruit is oblong, of a dark-scarlet color, sweetish, but insipid.

MULDER, GERARDUS JOHANNES, a distinguished Dutch chemist, was b. in 1802 at Utrecht, Netherlands, where his father was a physician. After obtaining the degree of doctor of medicine at the university of his native town in 1825, he commenced the practice of his profession at Amsterdam, where he was appointed to teach botany, and subsequently chemistry, in the newly-established medical school of that city. In 1841 he was elected professor of chemistry at the university of Utrecht, in consequence of the ability he had displayed in various memoirs published in the Dutch scientific journals. He is best known to the general reader as the discoverer of protein (q.v.), which he maintains to be the main ingredient of albumen, fibrin, casein, etc.; but the existence of which as an independent chemical compound is at the present day not generally admitted. He is the author of numerous excellent works on physiological and agricultural chemistry, on the chemistry of wine and beer, on diet and nutrition, etc., which, in consequence of their being written in Dutch, are far less known in this country than they deserve. His *Chemistry of Vegetable and Animal Physiology* has been translated into English by Dr. Fromberg, and his *Chemistry of Wine* by Dr. Bence Jones. He d. 1880.

MULE (Lat. *mulus*, supposed to be connected with Gr. *molos*, labor, and with Eng. *moil*), a hybrid animal, the offspring of the male ass and the mare, much used and valued in many parts of the world as a beast of burden. The ears are long; the head, croup, and tail resemble those of the ass rather than those of the horse; but in bulk and stature the mule approaches more nearly to the horse. The mule seems to excel both the ass and the horse in intelligence; it is remarkable for its powers of muscular endurance; and its sure-footedness particularly adapts it to mountainous countries. It has been common from very ancient times in many parts of the east; and is much used also in most of the countries around the Mediterranean sea, and in the mountainous parts of South America. Great care is bestowed on the breeding of mules in Spain and Italy, and those of particular districts are highly esteemed. In ancient times the sons of kings rode on mules, and they were yoked in chariots. They are still used to draw the carriages of Italian cardinals and other ecclesiastical dignitaries. Both in Spain and in South America mules employed to carry burdens are driven in troops, each preceded by an animal—in South America usually an old mare—called the *madrina*, or godmother, to the neck of which a little bell is attached, and the mules follow with the greatest docility.

As in other hybrid animals generally, males are more numerous among mules than females, in the proportion, it is said, of two or three to one. There is no instance on

record of offspring produced by two mules; but instances occur, although rarely, of their producing offspring with the horse and with the ass. The mule is very superior in size, strength, and beauty to the hinny, the offspring of the male horse and the female ass.

MULE. See SPINNING.

MULEY-HASSAN, SIDI, b. 1831; succeeded his father, Sidi Muley-Mohammed, as sultan of Morocco, 1873. In 1880 reports of shocking cruelties to the Jews in his dominions resulted in the calling of an international conference at Madrid by the king of Spain. The Sultan agreed to the protocol of the conference, calling for liberty of conscience in his dominions; but his incapacity or unwillingness to carry out any genuine reform left the condition of the Jews only slightly ameliorated. He d. in 1894.

MULFORD, ELISHA, D.D., LL.D., b. Montrose, Penn., abt. 1833; educated at Yale college, at Andover theological sem., and in Europe, where he spent two years in study and travel. He took holy orders in the Prot. Epis. church, and became rector of a parish in South Orange, N. J. He afterwards lived in retirement at Montrose, Penn., spending his time in close study, the result of which was his book, *The Nation; the foundations of Civil Order and Political Life in the United States*, which has taken high rank among the social science works of the day. This was followed by *The Republic of God*, a theological work of great originality and power. In his later years, Dr. Mulford made Cambridge, Mass., his home. He died in 1885.

MULGRAVE, CONSTANTINE JOHN PHIPPS, Lord, 1734–92; b. England; son of Baron Mulgrave, an Irish peer. He entered the British navy at an early age, and was made post-captain in 1765. He was returned to parliament as member for Lincoln in 1768, and distinguished himself in the debates on libels and on the Westminster election; on the latter subject he published a pamphlet. In 1773 he started, with two ships, on an exploring expedition toward the n.e. Arctic regions, and was stopped by ice at 80° 48′ n. lat. He gave an account of this voyage in his *Journal of a Voyage toward the North Pole*, 1774. He was appointed commissioner of the admiralty, and a peer, 1784.

MULGRAVE ISLANDS, an archipelago in the Pacific ocean, lying between lat. 3° s and 12° n. and long. 160° and 177° e.; composed of the groups of Brown, Raiick, Radack, Scarborough, and Kingsmill. The name is also applied, in a more limited sense, to the small group of the Radack chain, which was examined by lieut. Percival in 1825. The group forms a circular chain of narrow strips of land, about half a mile wide, inclosing an inland sea 140 m. in circumference. The islands are low and of a coral formation.

MÜLHAUSEN (Fr. *Mulhouse*), a town of Germany, in the imperial territory of Alsace-Lorraine. Pop. '95, 83,040. Mülhausen is built on a small island between the Ill and the Rhone and Rhine canal, and is an important station on the Strasburg and Basel line of railway. It lies in a fertile, well-watered district, and ranks as one of the most active centers of trade in Alsace; while it is also the seat of a tribunal of commerce, and of various mercantile and trade unions, which have exercised a beneficial influence on the industrial activity of the country. Its numerous manufactories produce superior woolen and fine cambric goods, excellent leather, morocco, and carpets; in addition to which, its printing and dye works for cotton, muslin, wool, and silk fabrics are almost unrivaled in regard to the delicacy of the colors and elegance of the patterns employed. Mülhausen has extensive bleaching-works, and is noted for its cotton and woolen stocking manufactories, its breweries and distilleries, starch and straw works, and for its iron-works, in which locomotives and various forms of steam-engines are extensively manufactured. These manufactures, together with corn, wine, and brandy, form the staple articles of its very extensive trade.

Mülhausen early acquired commercial importance, having been erected into a free imperial city by Rudolph of Hapsburg in 1273. By siding with some of the Swiss cantons in the 14th c., it was enabled to maintain a certain degree of neutrality in the feuds between the empire and France. In 1523 Mülhausen adopted the reformed faith. It remained a part of the circle of the upper Rhine till 1798, when it was incorporated with France. It became a town of the German empire after the war of 1870–71.

MULL, after the isle of Skye, the largest of the inner Hebrides, belongs to the county of Argyle, and is washed on the w. and s. by the Atlantic, and bounded on the n.e. by the sound of Mull. It is triangular in shape, hollowed on the w. side by an inlet of the Atlantic, and is deeply indented by sea-lochs, of which the principal are Loch-na-Keal and Loch Screidan. Area about 237,000 statute acres, of which 12,470 are arable; pop. '91, exclusive of the neighboring islets, 4691. Its surface is for the most part occupied by mountains, generally rounded in outline, and rising in Ben More 3,185 ft. high. Of its fresh-water lakes, Loch Erisa and Loch Ba are the chief. Wood abounds in the north; but owing to the generally tame character of the mountains, the great stretches of moorland, and the absence of well-defined valleys, the scenery, with the exception of that on the coast, is uninteresting. The land under cultivation occurs chiefly on the shores and at the heads of the several lochs. The soil is unusually fertile; but the great humidity of the climate, and the frequency and violence of the gales, render it almost wholly unfit for agriculture. The land is principally laid out in stock-farms, and great numbers of cattle, sheep, and horses are reared and exported. Chief town, Tobermory (pop. 1344), in the north. The harbor of Tobermory is one of the best and safest in the Hebrides. A low-water pier was completed here in Mar., 1864. It enables steamers to land in any state of the tide.

MULLANY, James Robert Madison, b. N. Y., 1818; entered the navy, 1832, and was made lieutenant in 1844. In the Mexican war, he was stationed on the coast of Mexico. He was appointed commander in 1861, and was captain of the *Oneida* at the battle of Mobile bay, Aug. 5, 1864, was severely wounded, and lost his right arm. He became commodore in 1870 and rear-admiral in 1874; retired, 1879; d. 1887.

MULLEIN, a genus of plants (*verbascum*) of the natural order scrophulariaceæ, consisting of tall, more or less woolly, biennial or perennial herbs with flowers in dense spikes or terminal racemes. Calyx five-parted, corolla somewhat unequally five-lobed, wheel-shaped, five woolly stamens, and a two-celled, two-valved, many-seeded capsule. Three European species, *V. blattaria*, *V. lychnitis*, and *V. thapsus*, have been naturalized in North America, and in Europe the leaves and flowers of two allied species, *V. thapsiforme*, and *V. phlomoides*, are also collected. The only species growing in North America which is used in medicine is *V. thapsus*, the common mullein, so often met in pasture-fields and on roadsides. It has leaves from 8 to 12 in. long, the upper ones sessile, and all decurrent, varying in shape from elliptic to oblong and oval-lanceolate; more or less crenate on the margin, and thickly covered with soft white hairs. They have but little smell, are mucilaginous, and have a faintly bitter taste. The corolla and the adhering stamens are the only part of the flower which is collected for the shops generally. The corolla is about 1½ in. broad, the three upper stamens having filaments covered with white wool; the two lower ones longer and smooth, with elongated decurrent anthers. The flowers are thoroughly dried and kept in dry, well-stoppered bottles, which preserves their delicate color; dampness causes them to turn dark. Morin obtained from them a trace of a yellowish volatile oil, a fatty substance, sugar, and coloring matter, which is insoluble in ether and cold water, but yields an alcoholic solution which gives a yellow precipitate when treated with a solution of acetate of lead. The leaves (*folia verbasci*) furnish the principal medicinal properties of the plant, but the flowers are used to make poultices, and the whole flower, with the peduncle, is often used by the Germans to make a gargle for ulcerated sore throat. An infusion of the leaves is used in catarrhal affections of the respiratory organs and the bowels, and in cystitis oil impregnated with the volatile oil of the flowers is used in Germany for frost bite and hemorrhoids. See illus., **Flowers**, vol. VI.

MULLEN, Tobias, d.d., b. Flushtown, Ireland, 1818; was educated at the national schools, and entered Maynooth coll., 1840; came to America, 1843; was ordained a Rom. Cath. priest, and was consecrated bp. of Erie, Penn., 1868.

MULLENS, Joseph, d.d., 1820–79; b. London, entered Coward college in 1837; took the degree of b.a. in 1841 at the university of London; was ordained in 1843, and the same year embarked for Calcutta as a missionary of the London missionary society. He prepared statistics of the missions in India and Ceylon, and visited the mission. In 1858 he visited England. In 1865, being invited to be assistant secretary with Dr. Tidman, he returned to England after visiting the missions in India and China. At Dr. Tidman's death he became sole foreign secretary. In 1870 he was sent as a delegate of the London society to the American board. After an absence of 15 months under commission to visit the Madagascar mission, he published *Twelve Months in Madagascar*. The directors having accepted from Mr. Arthington, of Leeds, in 1875 a liberal offer of help for a new mission on Lake Tanganyka, central Africa, Dr. Mullens accompanied the party, to direct the organization of the new mission. Arriving at Zanzibar, he concluded to go into the interior. The exposure and fatigue prostrated him, and he died of peritonitis, July 10. Dr. Mullens received the degree of d.d. from Williams college, Mass., in 1861, and from the university of Edinburgh in 1868. Besides the work on Madagascar, he published *A Brief Review of Ten Years' Missionary Labor in India, between* 1852 and 1863; *London and Calcutta compared in their Heathenism, Privileges, and Prospects.*

MÜLLER, Charles Louis, b. Paris, 1815; studied art at the school of fine arts, and with Gros and Cogniet. He was director of the Gobelin tapestry factories 1850–53, and became Flandrin's successor at the school of fine arts in 1864. His first exhibited picture was "Christmas Morning" (1837). His greatest work is "The Appeal of the Victims of the Terror." Among his other works is "Lanjuinais at the Tribune" (1869). D. 1892.

MÜLLER, Ferdinand von, Baron, b. Germany, 1825; educated at Kiel. He went to Australia in 1847, and for the next 5 years was engaged in botanical explorations. In the latter year he was appointed government botanist of the colony of Victoria. He was director of the Melbourne public garden 1857–73. He is the author of *Fragmenta Phytographiæ Australiæ; Plants of Victoria; Flora Australiensis*, 6 vols.; and other works. The king of Würtemberg ennobled him, in 1871.

MÜLLER, Friedrich, a German philologist b. at Jemnik, Bohemia, 1834; studied in Vienna in 1853–57: was librarian there in 1858–66; became in 1869 professor of comparative philology and Sanskrit at the university, and a member of the academy of sciences. He is considered one of the highest authorities in comparative philology and ethnology, and has contributed largely on these subjects to periodicals. His principal works are *Reise der oesterreichischen Fregatte Novarra; Linguistischer Theil; Ethnographischer Theil; Allgemeine Ethnographie.*

MÜLLER, Friedrich Max (Maximilian), one of the most eminent living orientalists, was born at Dessau, in the duchy of Anhalt-Dessau, Dec. 6, 1823. His father,

Wilhelm Müller, distinguished not only for his worth as a man, and his extensive and thorough scholarship, but as one of the first German lyric poets, was librarian of the ducal library, but died prematurely, Oct., 1827. Müller received the elements of his education at Dessau, and then went to Leipsic, where, under Prof. Hermann Brockhaus, he began the study of Sanscrit. This he soon chose as his special pursuit; and the first fruits of his labors appeared in a translation of the *Hitopadesa* (Leip. 1844). In 1844 he went to Berlin to study under Bopp and Shelling, and consult the Sanscrit MSS to be found there. In Paris, whither he repaired in 1845, be began, at the instigation of Burnouf, to prepare for an edition of the Rig-Veda, with the commentary of Sâyanâcârya. With this view he came to England, June, 1846, to examine the MSS. in the East India house, London, and the Bodleian library at Oxford; and, on the recommendation of the late Prof. H. H. Wilson, the East India company commissioned him (1847) to edit the Rig-Veda at their expense. The first volume of this great undertaking, printed at the Oxford university press, appeared in 1849; and the sixth and concluding volume was published in 1874. In 1850 Müller was appointed deputy Taylorian professor of modern languages at Oxford; in 1854 he succeeded to the professorship; and in 1858, was elected a fellow of All Souls. While pursuing his labors connected with the Rig-Veda, Müller has published treatises on a variety of philological topics, which have done more to awaken in England a taste for the science of language in its modern sense (see GRAMMAR) than the labors of any other single scholar. Inheriting the poetic imagination and fire of his father, Müller has at command such a felicity of illustration, that subjects dry under ordinary treatment, become in his hands attractive. He has published a translation into German of Kâlidâsa's *Megha-dûta* (König. 1847); *The Languages of the Seat of War in the East* (2d ed. Lond. 1855); *Comparative Mythology* (in the Oxford Essays for 1856); *History of Ancient Sanscrit Literature* (2d ed. Lond. 1860); lectures on *The Science of Language* (1861, last ed. 1889), *The Science of Religion* (1870). *Chips from a German Workshop*, in 4 vols., was published 1868–75; the Hibbert lectures on *The Origin and Growth of Religion*, in 1878; *Selected Essays*, in 1881. He is author of a romance, *German Love*, originally issued in Germany. He is editor of the important series *The Sacred Books of the East*, is one of the 8 foreign members of the institute of France, and has received the degree of LL.D. from Cambridge and Edinburgh.

MÜLLER, GEORGE, b. Kroppenstädt, Prussia, in 1805; was sent between the ages of 10 and 11 to the cathedral classical school at Halberstadt to prepare for the university. At the age of 15 he left the school and read the classics with Dr. Nagel. After spending 2½ years at the gymnasium of Nordhausen, he entered the university of Halle, and obtained permission to preach in the Lutheran church. In 1826 he began preaching, fired with a missionary zeal, "living for two months in free lodgings provided for poor students in divinity." He wrote to a titled lady of Frankfort of known liberality for a temporary loan; no answer came; but he received the amount asked from some one who had heard of his application, with an anonymous letter written in a very Christian tone. In June, 1828, he was invited to London by the society for promoting Christianity among the Jews, to engage in its service for six months; but, as the Prussian law required from him three years military duty, he was unable to accept. But a severe illness rendering him unfit for military service, he was exempted, and in Mar., 1829, reached London. He studied Hebrew and Chaldee, Becoming ill he went to Teignmouth for medical aid. Unable to conform to the discipline of the Jews' society, he ceased to be one of its students in 1830. He then settled as pastor of Ebenezer Chapel, laboring also in Bristol. He gave up pew rents, and depended on voluntary gifts, for which a box was placed in the chapel. Often reduced to a few shillings he made known his wants "to the Lord only," and they were supplied. In 1834 he and his co-laborers established the scriptural knowledge institution for home and abroad, "to assist day schools, Sunday-schools, and adult schools, to supply cheap Bibles, and aid missionary societies." In Dec., 1835, after a visit to the continent, he published a proposal for the establishment of an orphan house for destitute children bereft of both parents. In a second statement, dated Jan. 16, 1836, he said: "It is intended to receive the children from the 7th to the 12th year, and to let them stay in the house till they are able to go to service. Spontaneous offers of money and service were received, and the opening of the home was announced May 18, 1836. By May, 1837, there were 64 children in the two houses, and at the end of that year Mr. Müller published the first part of his narrative. At the end of 1838, there were 86 orphans in three houses; at the end of 1856, there were 297. He wrote: "Without any one having been personally applied to for anything by me the sum of £84,441 6s. 3½d. had been given to me for the orphans, as the result of prayer to God." He states how this has been expended, and he acknowledges the gifts sent to him for his own use. The number of orphans increased, and the buildings were multiplied until in 1875, "2,000 children were lodged, fed, and educated, without a shilling of endowment, without a committee, without organization, by funds drawn from all parts of the world." In addition to the support of his orphans, Mr. Müller through his institution sustains "numerous foreign and home missionaries and schools, and provides for the circulation of vast numbers of the Scriptures and religious tracts," refusing to make any appeal, or hold any meetings, relying on the efficacy of faith and prayer. Believing that he is an instrument in God's hand, working by faith and prayer, he says he issues no advertise-

ments or handbills of any of his services. His *Narrative* and other books and pamphlets have a large sale, and are among the means for giving information of his work. He is rightly held in high esteem for sincerity of character and grand usefulness: his work is its own testimonial both as to its Christian sources and its practical results. It is suggested by some that his advertised abstinence from all advertisement and solicitation is itself the most moving solicitation to the public heart; and that while his success is to be surely counted an answer to prayer, the prayer in this case, no less than in others, is answered in the use of the adequate instrumentalities.

MÜLLER, Gerhard Friedrich, 1705–83; b. Germany; educated at Leipsic. Entering the newly established St. Petersburg Academy, he gave instruction in history, geography, and Latin, and was soon appointed professor of history. In 1740 he went to Siberia, where he remained 10 years engaged in the study of its antiquities and geography. On his return, he became historiographer to the empire, and, in 1766, keeper of the national archives. He drew up for the government a collection of its treaties, and wrote a number of works on Russian history, whereon he was the first authority. His most important book, a *Collection for the History of Russia*, appeared at St. Petersburg, in 9 vols., from 1722 to 1764.

MÜLLER, Johann, early German mathematician. See Regiomontanus.

MÜLLER, Johannes von, historian of Switzerland, was b. Jan. 3, 1752, at Schaffhausen, where his father was clergyman and rector of the gymnasium. He studied at Göttingen under Heyne, Schlözer, Walch and others. In 1772 he was appointed professor of Greek at Schaffhausen, and in the same year published his first work, *Bellum Cimbricum* (Zür. 1772). Already he had commenced to devote his leisure hours to the investigation of Swiss chronicles and documents. By the advice of his friend Bonstetten, he went to Geneva in 1774, where he became a private tutor; and also (1778) delivered a series of lectures on "Universal History," afterwards published in 24 volumes. In 1781 he was called to the Collegium Carolinum at Cassel, as professor of statistics, and a little earlier published the first volume of his great work, *Geschichte der Schweizer*. In 1786 he was appointed librarian and councilor of state to the elector of Mainz; here he finished the 2d volume of his Swiss history; his *Darstellung des Fürstenbundes* (Leip. 1787); and *Briefe zweier Domherren* (Frankfürt, 1787). In 1792 he went to Vienna, where the emperor Leopold gave him a situation in the privy council, and, in 1800, appointed him first imperial librarian. In 1804 he left Vienna for Berlin, where he wrote *Ueber die Geschichte Friedrich's I., Ueber den Untergang der Freiheit der Alten Völker, Versuch über die Zeitrechnungen der Vorwelt,* and an additional volume of his Swiss history. Introduced to Napoleon after the battle of Jena, he was appointed by him (1807), having been previously dismissed from the Prussian service, secretary of state in the new kingdom of Westphalia; but died at Cassel, May 29, 1809. Müller's *Sämmtliche Werke* were published, 27 vols. Stuttgart, 1810–19; new edit., 40 vols., 1831–35.

MÜLLER, Johannes Peter, one of the most eminent physiologists of the present century, was b. at Coblenz, Germany, on July 14, 1801. He began to study with a view to orders in the Roman Catholic church; but in 1819 he abandoned his theological studies and devoted himself to medicine, taking, in 1822, the degree of doctor of medicine at Bonn. Whilst yet a student, he wrote for a prize the treatise *De Respiratione Fœtus* (Leip. 1823). He became, in 1824, a tutor; in 1826, an extraordinary, and in 1830, an ordinary professor of physiology and anatomy at Bonn; and in 1833 succeeded Rudolphi as professor of anatomy at Berlin. His physiological researches were most industriously prosecuted, and were rewarded by many discoveries, which obtained for him a high reputation in the scientific world. He died of apoplexy at Berlin, April 28, 1858. His works are numerous, and many of them occupied with particular topics in zoology and comparative anatomy. Among the most important are—*Zur vergleichenden Physiologie des Gesichtssinns des Menschen und der Thiere* (Leip. 1826); *Grundriss der Vorlesungen über die Physiologie* (Bonn, 1827); *Grundriss der Vorlesungen über allgemeine Pathologie* (Bonn, 1829; *De Glandularum Secernetium Structura Penitiori earumque prima Formatione in Homine atque Animalibus* (Leip. 1830); *Ueber die organischen Nerven der erectilen männlichen Geschlechtsorgane,* etc. (Berlin, 1835); and *Handbuch der Physiologie des Menschen* (2 vols. 4th ed. Coblenz, 1851). "Manual of the Physiology of Man," which has been translated into French and English. He was also the author of a large number of dissertions on a variety of subjects connected with physiology, the most important of which have been separately published. His latest investigations, on infusoria, were published in 1860. The most eminent living physiologists of Germany received their training in his school.

MÜLLER, Johann Friedrich Wilhelm, 1782–1816; b. Germany; studied engraving under his father, Johann Gotthard, at Stuttgart, and at the academy and the Louvre in Paris. In 1808 his engraving of "St. John about to write his Revelation," after Domenichino, won him a high reputation, which was maintained by his "Adam and Eve under the Tree of Life," after Raphael. In 1814 he was appointed professor of engraving in the Dresden academy, and the rest of his life was devoted to the execution of the plate of his greatest work, the "Madonna di San Sisto," after Raphael's picture of that name, in the Dresden gallery. His engravings are only 18 in number, mostly portraits,

including Schiller, Jerome Bonaparte, the king of Würtemberg, the poet Jacoby, and a medallion of Napoleon I.

MÜLLER, Johann Gotthard von, 1747–1830; b. Würtemberg; educated at the Stuttgart art academy, where he showed such a talent for design that he was allowed to give up his studies for the church, for which he had been intended, and make art his profession. He at first studied under the court painter Guibal, but, developing a talent for engraving, went to Paris in 1770, where, for six years, he studied under the engraver Wille. There he won a number of prizes, and was elected a member of the French academy. In 1776 duke Karl recalled him to Stuttgart, where he taught for 9 years, when he was summoned to Paris to engrave a portrait of Louis XVI., by Duplessis. Next in importance to this is his engraving of Trumbull's "Battle of Bunker Hill." He became professor of engraving on his return to Stuttgart, where his son Johann Friedrich was his most proficient pupil. He was elected a member of the principal European academies, and was knighted in 1818. Besides those mentioned, his best works are a "Madonna della Leggiola;" a "St. Catherine with two Angels," after Leonardo da Vinci; and a "Schiller," after the portrait by Graf.

MÜLLER, Julius, a German theologian, was b. at Brieg, Prussia, April 10, 1801, and was a brother of Karl Otfried Müller (q. v.), the antiquary. He studied at Breslau and Göttingen, at first devoting himself to law, but afterwards to theology. After much mental struggle he adopted religious views opposed to those of the rationalists. In 1825 he was appointed pastor at Schönbrunn and Rosen, near Strehlen, where he remained 7 years. Having acquired a high reputation for theological learning, he was appointed in 1831 second university preacher in Göttingen, and there lectured on practical theology and pedagogics. The spirit in which he labored there may be seen from his sermons, entitled *Das Christliche Leben, seine Kämpfe und seine Vollendung* (The Christian Life, its Struggles and its perfection; Bresl. 1834; 3d ed. 1847). In 1834 he became extraordinary professor of theology in Göttingen, and soon after ordinary professor in Marburg, from which he went in 1839 to occupy a similar chair in Halle. The work on which his reputation as a theologian chiefly rests is that on sin, *Die Christliche Lehre von der Sünde* (Bresl. 1839; 4th ed., revised and much altered, 2 vols., 1858), which has been translated into English. He afterwards published pamphlets on subjects of temporary interest, particularly in vindication of the cause of evangelical union against the attacks of the rigid Lutherans. He died Sept. 27, 1878. It was he who, in 1850, in conjunction with Neander and Nitzsch, edited a periodical entitled *Deutsche Zeitschrift für Christliche Wissenschaft und Christliches Leben.* He also contributed to the *Theol. Studien und Kritiken.* His work *Die Evangelische Union* appeared in 1854. He died in Oct., 1878.

MÜLLER, Karl Otfried, one of the most genial, richly erudite, and industrious classical archæologists of modern times, was b. Aug. 28, 1797, at Brieg, Prussia. He was the son of a clergyman, and received a careful education. He studied at Breslau and Berlin. His taste for philological and archæological studies was early developed. The first fruit of his learning was the publication of the *Aegineticorum Liber* (Berl. 1817), after which he soon received an appointment to the *Magdalenum* in Breslau, where his leisure hours were devoted to a grand attempt to analyze the whole circle of Greek myths. In 1819 he obtained an archæological chair in Göttingen; and to thoroughly prepare himself for it, visited the collections in Germany, France, and England. His great design was to embrace the whole life of ancient Greece, its art, politics, industry, religion, in one warm and vivid conception—in a word, to cover the skeletons of antiquity with flesh, and to make the dry bones live. With this view he lectured and wrote with a fine earnest animation, until the political troubles in Hanover made his position uncomfortable. He obtained permission to travel, and made tours in Greece and Italy, but unfortunately died of an intermittent fever at Athens Aug. 1, 1840. Müller's literary and scholarly activity stretched over the whole field of Greek antiquity. We are indebted to him for many new and striking elucidations of the geography and topography, literature, grammar, mythology, manners, and customs of the ancients. His work on the Dorians (*Die Dorier*, translated into English by sir George Cornwall Lewis and Henry Tuffnell) forms the 2d and 3d vols. of his *Geschichten Hellenischer Stämme und Städte* (new and improved ed. 3 vols. Bresl. 1844); his treatise *Ueber die Wohnsitze, Abstammung und ältere Geschichte des Macedon. Volks* (Berl. 1825); his *Etrusker* (2 vols. Bresl. 1828); and his maps of Greece, are works of the highest importance in the departments of ancient history and ethnology. His *Handbuch der Archäologie der Kunst* (Bresl. 1830, 3d ed. 1846; English by Leitch, London, 1850) is full of learning and of acute original observations. His *Prolegomenen zu einer wissenschaftlichen Mythologie* (Gött., 1825) led the way to a strictly historical explanation of the ancient myths. The work by which he is probably best known in England is his *History of the Literature of Ancient Greece* (Lond. 1840), undertaken at the request of the British "society for the diffusion of useful knowledge." Müller died before finishing it; what he had finished was translated into English by sir George Cornwall Lewis and Dr. Donaldson, the latter of whom continued the work from where it left off—at the age of Alexander—down to the taking of Constantinople. The German original was published by Müller's brother (Bresl. 1841). He showed himself also an acute and judicious critic in his editions of Varro, *De Linguâ Latinâ*, Festus, *De Significatione Verborum*, etc. His contributions to periodicals, encyclopedias, etc., were likewise numerous and valuable.

MÜLLER MAX. See MÜLLER, FRIEDRICH MAXIMILIAN.

MÜLLER, OTTO, 1816–94, b. at Schotten, Hesse, Germany; novelist, author of *Bürger* (1845); *Charlotte Ackerman* (1854); *Aus Petrarcas alten Tagen* (1861); *Der Majoratsherr* (1873), and *Schatten auf Höhen* (1881). See his *Life* by Schulte vom Brühl (1895).

MÜLLER, OTTO FREDERICK, 1730–84; b. Copenhagen; became tutor to a young nobleman, with whom he traveled over Europe, studying natural history. In 1763 he published a work on fungi, which was followed by two works on the insects and plants of the district where he lived. The titles of these works were: *Fauna Insectorum Friedrichsdaliana*, 1764; and *Flora Friedrichsdaliana*, 1767. He was then appointed by Frederic V. of Denmark, to continue the *Flora* of Denmark, of which work Oeder had published 3 vols. to which Müller added two. In 1771 he published in German a treatise *On Certain Worms Inhabiting Fresh and Salt Water*. In this work he gives an account of the structure and habits of annulose animals. His *Vermium Terrestrium et Fluviatilium seu Animalium Infusoriorum, Helminthecorum, et Testaceorum non Marinorum, succincta Historia*, which appeared between 1773 and 1774, describes the infusory animalcules, of which he discovered many new species, and which he was the first to divide into genera and species. It also contains a classification of the testaceous mollusca. In his *Hydrachnæ in Aquis Daniæ Palustribus Detectæ et Descriptæ*, 1785, he describes a large number of minute animals hitherto unknown. In 1777, he published a catalogue of the animals of Denmark, under the title of *Zoologicæ Danicæ Prodromus*. In 1779 he began the publication of his *Zoologia Danica*, which was intended to correspond in the animal kingdom, with his *Flora* in the vegetable; but only two parts were ever published. In 1786 was published, edited by his friend Otho Fabricius, a posthumous work on the infusory animalcules.

MÜLLER, PETER ERASMUS, 1776–1834; b. Copenhagen; studied at the university there, passing his theological examination 1791. After spending 18 months at some of the German universities he visited France and England. Returning he wrote numerous works, was appointed professor of theology in 1801; bishop in 1822; in 1830 bishop of Zealand, the highest ecclesiastical position in Denmark. He was an eminent theologian, and his theological works on *The Christian Moral System; Grounds for Belief in the Divinity of Christianity; Creeds of the Christian Church*, all in Danish, are very highly valued; but his literary reputation rests upon his essays on Danish and Norse antiquities. Of these the most valuable are, *On the Importance of the Iceland Language; On the Rise and Decline of Icelandic Historiography; On the Author of the Edda of Snórro; Critical Examination of the Last Seven Books of Saxo Grammaticus; Critical Examination of the Traditional History of Denmark and Norway;* and above all his *Sagabibliothek*, or *Library of the Sagas*, 3 vols. In this he gives an analysis of the contents of all the Icelandic *sagas* or *stories* now existing. He was the editor in 1805–30 of the *Danish Literary Gazette*, the oldest literary journal in Denmark, and one of the only three in Europe, which have been continued for a century without interruption.

MÜLLER, SOPHIE, 1803–30; b. Mannheim; a distinguished German actress. She made her first appearance on the stage in her 15th year. She acted at Vienna, Dresden, and Berlin, where her performances were highly applauded. She was also reader to the empress of Austria.

MÜLLER, WILHELM, 1794–1827; b. Dessau, Germany; educated at the university of Berlin, where he cultivated philology and early German literature. After serving in the Prussian army through the campaign of 1813, he devoted himself to the study of literature, and especially of early German poetry; as a result of the latter study, his *Blumenlese aus den Minnesänger* appeared in 1816. It was followed, two years later, by a translation of Marlowe's *Doctor Faustus*. After spending some time in Vienna, where he learned modern Greek, he made an Italian tour, of which he gave an account in his *Rom, Römer, and Römerinnen*. Returning to Germany, he was appointed teacher of classics in the Dessau school, and librarian of the ducal library. His literary reputation was raised to a high pitch by the publication of his *Gedichte aus den Hinterlassenen Papieren Eines Reisenden Waldhornisten*, in 1824, and his *Lieder der Griechen* the next year. He particularly excelled in the composition of what are called by the Germans *Reiselieder* or *Wanderlieder*, lyrics of travel and out-door life. He contributed to *Urania*, and other periodicals, and to encyclopædias. He was the father of Max Müller.

MÜLLER, WILLIAM JOHN, 1812–45, b. England; studied landscape under the painter J. B. Pyne, and made a sketching tour through Germany, Switzerland, and Italy. His first exhibited picture of "Peasants on the Rhine" was not successful, and to improve himself in his art he made a long tour through Greece and Egypt, studying the remains of ancient architecture. In 1840 he exhibited at the Academy pictures of "Athens" and "Memnon," which showed great progress. Two years afterwards his "Picturesque Sketches of the Age of Francis I." gave him a high reputation. In 1843 he joined sir Charles Fellows in the expedition to bring the Xanthian marbles to London. As a result of this journey he exhibited in the Academy of 1845 five pictures: "Head of a Cingari;" "Tent Scene;" "Turkish Merchants;" "The Burial Ground at Smyrna," and

"Cannon of the Knights Templars." These pictures were hung to such a disadvantage as to escape the attention of most of the spectators; and Muller is said to have died from chagrin in consequence. He exhibited at the British institution, the year of his death, a "Dance at Xanthus," and a "View of Rhodes." Of his other works, some of his earlier landscapes, and his later "Sphinx" and "Prayers in the Desert," deserve mention. His pictures have commanded high prices since his death.

MULLET, *Mugil,* a genus of acanthopterous fishes, the type of the family *mugilidæ.* In this family, the body is nearly cylindrical, the scales are large; there are two widely separated dorsal fins the first of which has only four stiff, sharp spines; the teeth are extremely fine; the gullet is closed by an extraordinary development of the pharyngeal bones, so that only soft and thin food can pass down it; a branch of the stomach forms a kind of gizzard. The best-known of this family belong to the genus *mugil,* of which there are many species. They have a small mouth, with a fold or crest in the under lip, which fits into a corresponding notch in the upper one. The COMMON MULLET, or GRAY MULLET (*M. capito*), is found in the Mediterranean, and along the western shores of Europe, as far as the southern and south-eastern shores of England, but becomes rare further north. The common mullet is usually about 15 in. in length, but sometimes two feet. The color is steel gray on the back, with bluish and yellowish reflections; the belly silvery white; the flanks with six or eight longitudinal lines of rosy brown. It often ascends rivers, generally selecting soft or fat substances for food, and often seeking food by thrusting its mouth into the soft mud. It is most readily taken by a bait of the boiled entrails of fish, or cabbage boiled in broth. It is easily reared in ponds, and readily answers the call which usually summons it to be fed. It is highly esteemed for the table.—A very nearly allied species, also called GRAY MULLET (*M. cephalus*), a native of the Mediterranean, is distinguished by having the eyes half covered with an adipose membrane, and by a large triangular scale pointing backwards, just over the origin of each pectoral fin. It attains a larger size than the former species, sometimes 10 or 12 lbs. weight. It enters the mouths of rivers at certain seasons, and ascends into the fresh water. It is the most esteemed of all the mullets, and was in great request among the ancients. Enormous prices were given by the Romans for unusually large mullets, the price increasing, like that of diamonds, far more rapidly than the size. Mullets are used fresh, salted, and smoke-dried. A preparation of their roe, called *botarcha,* is in great esteem as a condiment in Italy and the s. of France. Mullets are often caught in the Mediterranean by angling from a rock, with a bait paste, when they have been previously attracted to the spot by macaroni thrown into the water. A third species of GRAY MULLET (*M. chelo*) is not unfrequent on the coasts of England, and even of Scotland. It is remarkable for its large fleshy lips. It swims in great shoals. In the Mediterranean it sometimes attains the weight of 8 lbs. The AMERICAN MULLET (*M. albula*) is very like the common mullet, but more slender, the tail large and forked. It abounds about the Bahama islands, and extends far northwards. It is highly esteemed for the table.

The name mullet is also given to the genus *mullus* of the family *percidæ.* See SURMULLET

MULLET, or MOLLET, in heraldry, is a charge in the form of a star, generally with five points, intended to represent a spur-rowel, and of frequent occurrence from the earliest beginnings of coat-armor. Gwillim, sir George Mackenzie, and Nisbet lay it down that mullets should always be pierced to represent the round hole in which the spur-rowel turns, but this has been by no means uniformly attended to in practice. Much confusion exists in blazonry between mullets and stars; in England the rule most generally adopted is that the mullet has five points, whereas the star has six, unless any other number be specified. Nisbet lays down a canon nearly the converse of this, which has never been adhered to; and in Scottish heraldry the same figure seems to be often blazoned as a mullet or a star, according as it accompanies military or celestial figures. The mullet is the mark of cadency assigned to the third son, "to incite him to chivalry." The word mullet is occasionally used in heraldry for the fish so called.

MULLIDÆ. See SURMULLET.

MULLINGAR', par. and civic t. of the co. of Westmeath, in Ireland, is situated on the great western road from Dublin to Galway, distant from the former, with which it is connected by the Royal canal and the Midland Great Western railway, 50 m. n.n.w. It is the center of a poor-law union of forty-eight divisions, comprising an area of 208,401 acres. Mullingar is a place of little historical interest, although its immunities date from the reign of Elizabeth. Its public buildings are in no way remarkable, but it possesses several schools; among the number, one recently endowed for general educational purposes. It is the see of the Roman Catholic bishop of the diocese of Meath, and has a cathedral and infantry barracks. It is without manufactures, but has considerable celebrity as the site of several of the most important horse and cattle fairs in Ireland. Pop. '91, 8300, town 5300.

MULLION, the upright division between the lights of windows, screens, etc., in Gothic architecture. Mullions are rarely met with in Norman architecture, but they become more frequent in the early English style, and in the decorated and perpendicular are very common. They have sometimes small shafts attached to them, which carry the

tracery of the upper part of the windows. In late domestic architecture they are usually plain.

MULLINS, William, 1575–1621 ; b. in England, adopted the principles of the Puritans, and with them took refuge first in Holland and then in America. He was a man of wealth, had much influence in deciding upon the movements of the colonists, and was one of the signers of the celebrated compact drawn up on the *Mayflower*. The severe New England winter proved too much for his health and he died about six months after the landing at Plymouth Rock ; his wife and children soon followed him, with the exception of a daughter, Priscilla, the heroine of Longfellow's *Courtship of Miles Standish*; and from the marriage of John Alden and Priscilla Mullins are descended a number of eminent men of our own day.

MÜLLNER, Amadeus Gottfried Adolf, 1774–1829, b. in Prussia, took a degree in jurisprudence at Leipsic, and practised law. He wrote a number of works on legal topics, and also novels and dramas. Two of his dramas, *Der Neunundzwanzigste Februar* and *Die Schuld*, were once very popular, but are now forgotten.

MULOCK, Dinah Maria. See Craik.

MULREADY, William, r.a., was b. at Ennis, county Clare, Ireland, 1786. When a boy he went to London with his parents; at the age of fifteen entered as a student in the Royal Academy, and made good progress, aiming at first at the classic style, or what, according to the notions of the day, was called high art. Following the bent of his genius, however, he soon relinquished this course, and devoted himself to the study of nature and the works of those artists who attained high reputation in a less pretentious walk of art. His first pictures were landscapes of limited dimension and subject, views in Kensington gravel-pits, old houses at Lambeth, and interiors of cottages. He next essayed figure-subjects of incidents in every-day life, such as "A Roadside Inn," "Horses Baiting," the "Barber's Shop," and "Punch" (painted in 1812), "Boys Fishing" (1813), "Idle Boys" (1815). Mulready was elected an associate of the royal academy in Nov., 1815, and an academician in Feb., 1816; a strong proof of the high estimation in which his talents were held by his brethren, for the higher dignity is rarely conferred till after a probation of several years as associate. Even in his earliest time his works were characterized by much elaboration; but those he executed about the middle period of his career exhibit an extraordinary amount of finish and greater brilliancy of coloring, qualities that he carried further and further as he advanced in years; and though he lived to a great age (he died on July 7, 1863), he continued to work with undiminished powers till within a day of his death. A great number of Mulready's best works now belong to the public, as portions of the Vernon and Sheepshanks's collections. In the first named there are four pictures, one of these, "The Last in, or Truant Boy," exhibited in 1835, being one of the most elaborate works of his middle period; while in the Sheepshanks' collection there are no fewer than twenty-eight of his works, among which, "First Love," exhibited in 1840, is a remarkable example of refinement in drawing, and delicacy of feeling and expression. "The Sonnet," exhibited in 1839, is perhaps his highest effort in point of style; and by "The Butt—Shooting a Cherry," exhibited in 1848, is best exemplified the remarkable minuteness of his finish and richness of his coloring. An edition of the *Vicar of Wakefield*, published in 1840, by Van Voorst, embellished with twenty wood-cuts from Mulready's drawings, is a very fine work. "Women Bathing" was exibited in 1849; and, in 1852, "Blackheath Park." "The Toy Seller," a large picture exhibited the year before he died, was unfinished, and not at all equal to earlier and smaller ones, but remarkable as the work of a man whose artistic efforts had been lauded sixty years before.

MÚLTÁN, or *Mooltan*, a city and municipality of British India, in the Punjab, on a mound consisting of the ruins of ancient cities that occupied the same site, 7 miles from the left bank of the Chenab—the inundations of which sometimes reach Múltán—and 190 m. s.w. by w. of Lahore. It has railway communication with all the principal towns of India—Calcutta, Bombay, Madras, Peshawur, etc. The city is surrounded by a dilapidated wall, from 40 to 50 ft. in height. The vicinity abounds in mosques, tombs, shrines, etc., attesting alike the antiquity and magnificence of the former cities; and the country around is remarkable for its fertility. Múltán is a military station, with a small redoubt in the rear of the cantonment. Its bazars are numerous, extensive, and well stocked; and its shops are well supplied with European and Asiatic commodities. Manufactures of silks, cottons, shawls, scarfs, brocades, tissues, etc., are carried on, and there is an extensive banking trade. The merchants of Múltán are proverbially esteemed extremely rich. Steamers ply between this city and Hyderabad, a distance of 570 m.; and the Indus Valley railway opens up a commercial outlet from central Asia, the Punjab, and the North-West Provinces, to the Arabian sea by Hyderabad and Karachi. In 1849 Múltán was taken by the British troops under Gen. Whish, and annexed with its territory to the British possessions. The pop. of Mùltán in 1891 was 74,562.

MULTIPLE-POINDING, is a well-known form of action in Scotland, by which competing claims to one and the same fund are set at rest. It means double poinding or double distress, suggesting that a person who has funds in his possession is liable to be

harassed by double distress; and hence he commences a suit called the action of multiple-poinding, by which he alleges that he ought not to be made to pay the sum more than once; and as he does not know who is really entitled to payment, he cites all the parties claiming it, so that they may fight out their claims among themselves. The suit corresponds to what is known in England as a bill or order of interpleader.

MULTIPLICA'TION, the third and most important of the four principal processes of arithmetic, is a compendious mode of addition, when a number is to added to itself a given number of times. The three terms of a multiplication are the *multiplicand*, or number to be multiplied; the *multiplier*, or number by which it is to be multiplied; and the *product*, giving the amount which would be obtained if the multiplicand were added to itself the number of times denoted by the multiplier. The symbol of multiplication is $\times$; and in arithmetic the numbers are placed above each other as in addition, with a line drawn under them; in algebra the quantities are merely placed side by side, with or without a dot between them—e.g., the multiplication of 2 by 4 may be written 2×4, and of a by b, $a \times b$, $a.b$, or ab. For multiplication of fractions, see FRACTION.

The operation of multiplication has been much abbreviated by the use of logarithms (q.v.), and has been rendered a mere mechanical process, by the invention of Napier's bones, the sliding rule, Gunter's scale, etc.

MULTIVALVE SHELLS, or MULTIVALVES, are those shelly coverings of mollusks which are formed of more than two distinct pieces. In systems of conchology (q.v.) the term is one of primary importance; but since the study of the living animals has led to arrangements very different from those founded on their mere shells, a very subordinate place has been assigned to it, as indicating a distinction much less important than was at first supposed. Thus chitons (q.v.), which have multivalve shells, are now placed in the same order of gasteropods with limpets (q.v.) of which the shells are univalve; and *pholas* (q.v.) and *teredo* (q.v.), which have two principal valves and some small accessory valves, the latter also a long shelly tube, are placed among lamellibranchiate mollusks, along with most of the bivalves of conchologists. In conchological systems, barnacles and acorn-shells were also generally included, and ranked among multivalves; but these are now no longer referred even to the same division of the animal kingdom. See CIRRHOPODA.

MULTNOMAH, a co. in n.w. Oregon; drained by the Willamette and Columbia rivers, the latter being its n. boundary; traversed by the Northern Pacific, the Oregon Navigation Co.'s, and the Southern Pacific railroads; about 440 sq. m.; pop. '90, 74,884, chiefly of American birth. The surface is nearly level, and is covered by forests, lumber being the chief product. Co. seat, Portland.

MUL'TURES, in Scotch law, mean a quantity of grain either manufactured or in kind deliverable to the proprietor or tacksman of a mill for grinding the corn sent there. Some persons living in the neighborhood are bound to send their corn to be ground at a particular mill, in which case the lands are said to be astricted to the mill, and form the thirl or suken, and the tenants or proprietors of the lands are called insucken multurers. Those who are not bound to go to the mill are called outsucken multurers. Thirlage is thus classed among servitudes, being a kind of burden on the lands. Such a right is unknown in England, except sometimes in old manors.

MUM, a peculiar kind of beer, formerly used in Great Britain, and still used in Germany, especially in Brunswick, where it may be almost regarded as the national drink. Instead of only malt being used, it is made of malt and wheat, to which some brewers add oats and bean-meal. It is neither so wholesome nor so agreeable as the common ale or beer.

MUMMIUS, LUCIUS, about B.C., 185–130; a Roman of plebeian birth; first spoken of as a prætor in the province of farther Spain, where he met with some, but not very great military success. In 146 he was elected consul and placed in command of the Achæan war. The first battle was decisive. It was fought near Corinth and resulted in the complete defeat of the Grecian allies. The surname of Achaicus was given to Mummius, and a triumph was decreed a second time. The cities of Corinth, Thebes, and Chalcis were plundered and then destroyed by the Roman troops. As trophies of his victory, Mummius caused many of the most valuable works of art to be sent to Rome; and it is related of him, as illustrating his dense ignorance in everything not pertaining to military matters, that he insisted that, if those who were to convey the pictures and statues should break or lose any, they should *replace them by new ones*. Cicero speaks of him as a blunt and plain but honest man, and says that, of all his enormous plunder, none was reserved for his own use. In 141 he was again elected consul, and it was then that the capitol was gilded for the first time. Nothing is known certainly about his later life and his death, some writers saying that he died in exile at Delos, and others that his death occurred in Rome, and that his daughter received a dowry from the senate.

MUMMY. See EMBALMING.

MUMMY-WHEAT is said to be a variety of wheat produced from grains found in an Egyptian mummy. But no good evidence of this origin has been adduced—in fact it is as good as proved to be impossible; and the same variety has long been in general cultivation in Egypt and neighboring countries. The spike is compound—a distinguishing character, by which it is readily known, but which is not altogether permanent.

MUMPS, The, is a popular name of a specific inflammation of the salivary glands described by nosologists as *cynanche parotidæor* or *parotitis.*

The disorder usually begins with a feeling of stiffness about the jaws, which is followed by pains, heat, and swelling beneath the ear. The swelling begins in the parotid, but the other salivary glands (q.v.) usually soon become implicated, so that the swelling extends along the neck toward the chin, thus giving the patient a deformed and somewhat grotesque appearance. One or both sides may be affected, and, in general, the disease appears first on one side and then on the other. There is seldom much fever. The inflammation is usually at its highest point in three or four days, after which it begins to decline, suppuration of the glands scarcely ever occurring. In most cases no treatment further than antiphlogistic regimen, due attention to the bowels, and protection of the parts from cold, by the application of flannel or cotton-wool, is required, and the patient completely recovers in eight or ten days.

The disease often originates from epidemic or endemic influences, but there can be no doubt that it spreads by contagion; and, like most contagious diseases, it seldom affects the same person twice. It chiefly attacks children and young persons.

A singular circumstance connected with the disease is, that in many cases the subsidence of the swelling is immediately followed by swelling and pain in the *testes* in the male sex, and in the *mammæ* in the female. The inflammation in these glands is seldom very painful or long continued, but occasionally the inflammation is transferred from these organs to the brain, when a comparatively trifling disorder is converted into a most perilous disease.

MÜNCHAUSEN, Karl Friedrich Hieronymus von, Baron, a member of an ancient and noble German family, who attained a remarkable celebrity by false and ridiculously exaggerated tales of his exploits and adventures, so that his name has become proverbial. He was b. in 1720, at the family estate of Bodenwerder, in Hanover, served as a cavalry officer in the Russian campaigns against the Turks in 1737–39, and died in 1797. A collection of his marvelous stories was first published in England under the title of *Baron Münchausen's Narrative of his Marvelous Travels and Campaigns in Russia* (Lond. 1785). A second edition appeared at Oxford (1786) under the title of *The Singular Travels, Campaigns, Voyages, and Sporting Adventures of Baron Munnikhousen, commonly pronounced Munchausen; as he relates them over a bottle when surrounded by his friends.* Several other editions rapidly followed. In the same year (1786) appeared the first German edition, edited by the poet Bürger; the latest—entitled *Des Freiherrn von Münchausen wunderbares Reisen und Abenteuer* (1849 and 1855)—is enriched by an admirable introduction by Adolf Ellisen, on the origin and sources of the famous book, and on the kind of literary fiction to which it belongs. Ellisen's father knew the splendid old braggart in his latter days, and used to visit him. Nevertheless, although Raspe may have derived many of his narratives from Münchhausen himself, he appears to have drawn pretty largely from other sources. Several of the adventures ascribed to the baron are to be found in older books, particularly in Bebel's *Facetiæ* (Strasb. 1508); others in Castiglione's *Cortegiano,* and Bildermann's *Utopia,* which are included in Lange's *Deliciæ Academicæ* (Heilbronn, 1765).

MUNCH, Peter Andreas, 1810–63; b. Norway, educated at Skien and at the university of Christiania, where he took a degree in jurisprudence. Preferring the study of languages and history to law, he became professor of history at Christiania. In 1861 he was appointed historiographer and archivist of Norway. His favorite studies were the ancient history and languages of Scandinavia, on which he propounded some novel theories. He maintained that three distinct dialects prevailed in the kingdoms of Norway, Sweden, and Denmark, and that the so-called Icelandic literature was really the production of ancient Norway. He held that the modern Icelanders keep one dialect and the inhabitants of the Färoe islands another of the ancient Norwegian. He rejected the term "Icelandic," for which he substituted "Old Norwegian." He was a bitter opponent of "Scandinavism," or the union of Norway, Sweden, and Denmark in one kingdom. He published an *Old Norwegian Grammar,* an *Old Norwegian Reading Book,* and a *History of Norway, Sweden, and Denmark,* and edited a number of Icelandic works, including the elder *Edda* and the *Royal Mirror.*

MÜNCH-BELLINGHAUSEN, Eligius Franz Joseph von, Baron, 1806–71; b. Cracow; studied jurisprudence, and held a number of government offices in Austria. His first play, *Griseldis,* was produced at the Burg Theatre in Vienna, of which he was afterwards director, in 1834, and was well received. It was followed by *The Adept,* 1836; *Camoens,* 1837; *Imelda Lamberdazzi,* 1838; and the *Son of the Wilderness,* 1843, well known on the American stage under the name of *Ingomar. Maria de Molina* appeared in 1847, and *The Gladiator from Ravenna,* his greatest work, in 1854. He published also a volume of verses. He wrote under the pseudonym of "Friedrich Halm."

MÜNCHEN-GLADBACH, a t. and province, Prussia, 16 m. by rail, w. of Düsseldorf. It has large manufactures of linen and damask cloths. Pop. '90, 49,600; comm. 10,300.

MÜNDEN. See Minden.

MUNDT, KLARA (MÜLLER), 1814–73; her father, aulic councilor of Neubrandenburg, gave her an excellent education which rapidly developed the powers of her mind and turned her attention to the study of serious subjects. She was married in 1839 to the radical writer Theodor Mundt, whose advanced opinions in regard to the emancipation of women, etc., she adopted. She began her literary career under the pseudonym of Louise Mühlbach, and published a large number of romances abounding in startling situations, in which poison and the stiletto play a principal part. She is best known by her historical novels, which have all been translated into English, and are distinguished rather for their brilliancy than for their accuracy. Among them are *Joseph II. and his Court; Frederick the Great and his family; Marie Antoinette and her son; Queen Hortense; Goethe and Schiller;* and *Napoleon and Blucher.*

MUNCIE, city and co. seat of Delaware co., Ind.; on the White river and the Cleveland, Cincinnati, Chicago, and St. Louis, the Fort Wayne, Cincinnati and Louisville, and the Lake Erie and Western railroads; 53 miles n.e. of Indianapolis. It is the seat of the eastern Indiana normal university, and contains a public library, hospital, high school, electric light and street railroad plants, waterworks, about 20 churches, several national banks, a number of iron and steel works, pulp mill, and several large glass works. Pop. '90, 11,345.

MUNDANE EGG. In many heathen cosmogonies, the world (Lat. *mundus*) is represented as evolved from an egg. The production of a young animal from what neither resembles it in form nor in properties, seems to have been regarded as affording a good figure of the production of a well-ordered world out of chaos. Thus, in the Egyptian, Hindu, and Japanese systems, the Creator is represented as producing an egg, from which the world was produced. The same notion is found, in variously modified forms, in the religions of many of the ruder heathen nations. Sometimes a bird is represented as depositing the egg on the primordial waters. There are other modifications of this notion or belief in the classical and other mythologies, according to which the inhabitants of the world, or some of the gods, or the powers of good and evil, are represented as produced from eggs. The egg appears also in some mythological systems as the symbol of reproduction or renovation, as well as of creation. The Mundane Egg belonged to the ancient Phœnician system, and an egg is said to have been an object of worship.

MUNDT, THEODOR, 1808–61; b. Prussia; educated at the universities of Berlin and Leipsic. He took an active interest in public affairs, and identified himself with that party of rising authors, journalists, and politicians, known as "Young Germany." His political views brought him into disfavor with the government, and he left Germany, and made a European tour. On his return he was permitted to become a member of the teaching body of the university of Berlin, and in 1848, he was appointed to the chair of history at Breslau. Two years later he was made director of the Berlin university library. The first of his works to attract attention was *Madonna, or Conversations with a Saint*, a powerful but unwholesome book, which is said to have induced Charlotte Stieglitz to kill herself out of affection for her husband. Her works were collected and published by Mundt in 1835. After the publication of a number of books of travel, he wrote a series of historical or romantic novels, of which the most successful were: *Carmola, or the Anabaptists*, 1844; *Mendoza, or the Arch-scoundrel*, 1847; and *The Matadores*, 1850. He edited in conjunction with Varnhagen von Ense, the posthumous works of Knebel, and prepared an edition of the political writings of Luther. He also wrote a *History of Society, History of Contemporary Literature*, and a universal literary *History*. He married the novelist, Klara Müller.

MUNGER, THEODORE THORNTON, D.D., American theologian and author, was born at Bainbridge, N. Y., in 1830; was educated at Yale College and Yale Divinity School; was pastor of Congregational churches at Dorchester, Haverhill, Lawrence, and North Adams, Mass., and in 1885 was called to the United Congregational Church, New Haven, Conn. He is widely known as a writer of fine discrimination and force on subjects pertaining to spiritual life, and has published *On the Threshold, The Freedom of Faith, Lamps and Paths, Immortality and Modern Thought, The Appeal to Life.*

MUNGO, SAINT, the popular name of St. Kentigern, one of the three great missionaries of the Christian faith in Scotland. St. Ninian (q.v.) converted the tribes of the s.; St. Columba (q.v.) was the apostle of the w. and the n.; St. Kentigern restored or established the religion of the Welsh or British people, who held the country between the Clyde on the n., and the furthest boundaries of Cumberland on the s. (see BRETTS AND SCOTS). He is said to have been the son of a British prince, Owen ab Urien Rheged, and of a British princess, Dwynwen or Thenaw, the daughter of Llewddyn Lueddog of Dinas Eiddyn, or Edinburgh. He was born about the year 514, it is believed at Culross, on the Forth, the site of a monastery then ruled by St. Serf, of whom St. Kentigern became the favorite disciple. It is said, indeed, that he was so generally beloved by the monastic brethren, that his baptismal name of Kentigern or Cyndeyrn, signifying "chief lord," was exchanged in common speech for Mungo, signifying "loveable" or "dear friend." Leaving Culross, he planted a monastery at a place then called Cathures, now known as Glasgow, and became the bishop of the kingdom of Cumbria (q.v.). The nation would seem to have been only partially converted, and the accession of a new king drove St. Kentigern from the realm. He found refuge among the kindred people of Wales, and there, upon the banks of another Clyde, he founded another monastery and bishopric, which still bears the name of his disciple, St. Asaph. Recalled to Glasgow by a new

king, Rydderech or Roderick the Bountiful, Kentigern renewed his missionary labors, in which he was cheered by a visit from St. Columba, and dying about the year 601, was buried where the cathedral of Glasgow now stands. His life has been often written. A fragment of a memoir, composed at the desire of Herbert, bishop of Glasgow, between 1147 and 1164, has been printed by Mr. Cosmo Innes in the *Registrum Episcopatus Glasguensis*. The longer life by Joceline of Furness, written about 1180, was published by Pinkerton in his *Vitæ Antiquæ Sanctorum Scotiæ*. It appeals to two still older lives. The fame of St. Kentigern is attested by the many churches which still bear his name, as well in Scotland as in the n. of England. The church of Crosthwaite, where Southey is buried, is dedicated to him. The miracles which he was believed to have wrought were so deeply rooted in the popular mind, that some of them sprung up again in the 18th c. to grace the legends of the Cameronian martyrs. Others are still commemorated by the armorial ensigns of the city of Glasgow—a hazel-tree whose frozen branches he kindled into a flame, a tame robin which he restored to life, a hand-bell which he brought from Rome, a salmon which rescued from the depths of the Clyde the lost ring of the frail queen of Cadyow.

MUNICH (Ger. *München*), the capital of Bavaria, is situated in 48° 8′ 45″ n. lat., and 11° 36′ 38″ e. long., in the midst of a barren and flat elevated plain, at a height of about 1700 ft. above the level of the sea. Pop. '85, 261,981; '95, 407,174, about 84 per cent. being Roman Catholics, 14 per cent. Protestants, and 2 per cent. Jews. Munich lies chiefly on the left bank of the Isar, and consists, in addition to the old town, of five suburbs, and of the three contiguous districts of Au, Haidhausen, and Obergiesing. By the efforts of king Ludwig I., who spent nearly 7,000,000 thalers on the improvements of the city, Munich has been decorated with buildings of almost every style of architecture, and enriched with a larger and more valuable collection of art treasures than any other city of Germany. It possesses many churches of different denominations, and of these, the most worthy of note are: the cathedral, which is the see for the archbishopric of Munich-Freising, built between 1468–94, and remarkable for its two square towers, with their octagonal upper stories, capped by cupolas, and its 30 lofty and highly-decorated windows; the church of the Jesuits, or St. Michael's, which contains a monument by Thorwaldsen to Eugène Beauharnais; the Theatiner Kirche, completed in 1767, and containing the burying-vaults of the royal family; the beautiful modern church of St. Mariahilf, with its gorgeous painted glass and exquisite wood carvings; the round church, or Basilica of St. Boniface, with its dome resting on 64 monoliths of grey Tyrolean marble, and resplendent with gold, frescoes, and noble works of art; the cruciform-shaped Ludwig Kirche, embellished with Cornelius's fresco of the Last Judgment; and lastly, the Court Chapel of All Saints, a perfect casket of art treasures. Among the other numerous public buildings, a description of which would fill a volume, we can only briefly refer to a few of the more notable; as the theater, one of the largest in Germany, and capable of accommodating 2,200 spectators; the post-office; the Ruhmes-halle; the new palace, including the older royal residence, the treasury and chapel, antiquarian collections, etc.; and the Königsbau, designed by Klenze in imitation of the Pitti palace, and built at a cost of 1,250,000 thalers, containing J. Schnorr's frescoes of the Nibelungen; the banqueting halls, rich in sculpture by Schwanthaler, and in grand fresco and other paintings. In the still incomplete suburb of Maximilian are situated the old Pinakothek, or picture-gallery, erected in 1836 by Klenze, containing many engravings, drawings, and statues, a collection of Etruscan remains, etc.; and immediately opposite to it, the new Pinakothek, completed in 1853, and devoted to the works of recent artists; the Glyptothek, with its galleries of ancient sculpture, and its noble collection of the works of the great modern sculptors, as Canova, Thorwaldsen, Schadow, etc. Among the gates of Munich, the most beautiful are the Siegesthor ("The Gate of Victory"), designed after Constantine's triumphal arch in the Forum, and the Isarthor with its elaborate frescoes. In addition to these and many other buildings intended either solely for the adornment of the city, or to serve as depositories for works of art, Munich possesses numerous scientific, literary and benevolent institutions, alike remarkable for the architectural and artistic beauty of their external appearance and the liberal spirit which characterizes their internal organization. The library, which is enriched by the biblical treasures of numerous suppressed monasteries, contains almost 1,300,000 volumes, of which 1300 are incunabula, with nearly 30,000 MSS. The university, with which that of Landshut was incorporated in 1826, and now known as the Ludwig-Maximilian University, comprised, in 1896, a staff of 177 professors and teachers; and in the same year the number of matriculated students attending the university was 3621. In association with it are numerous medical and other schools, a library containing 300,000 volumes, and various museums and cabinets. The well known *Allgemeine Zeitung* is now published here.

Munich has an ably conducted observatory, supplied with first-rate instruments by Frauenhofer and Reichenbach; numerous gymnasia, Latin, normal, military, professional, polytechnic, and parish schools, of which the majority are Catholic; institutions for the blind, deaf and dumb, and crippled, and for female orphans, besides numerous hospitals, asylums, infant schools, etc.; an academy of sciences; royal academies of painting, sculpture, music, etc.; a botanic garden, parks, public walks, and gardens adorned with historic, patriotic, and other monuments, and designed for the celebration of annual and other national fairs and festivals; spacious cemeteries, etc. Munich is mainly indebted

to Ludwig I. for its celebrity as a seat of the fine arts, as the greater number of the buildings for which it is now famed were erected between 1820 and 1850, although, under his successors, Maximilian II., and Ludwig II. (ascended the throne in 1864), the progress of the embellishments of the city has been continued on an equally liberal scale. Munich is somewhat behind many lesser towns of Germany in regard to literary advancement and freedom of speculation, while its industrial activity is also inferior to its state of high artistic development. It has, however, some eminently good iron, bronze, and bell foundries, and is famed for its lithographers and engravers, and its optical, mathematical, and mechanical instrument-makers, amongst whom Utzschneider, Frauenhofer, and Ertl have acquired a world-wide renown. Munich is noted for its enormous breweries of *Bavarian beer;* and manufactures cotton, wool, and damask goods, wax-cloth, leather, paperhangings, carriages, pianos, gold, silver articles, machinery, and steel wares, etc.

The present name of this city cannot be traced further than the 12th c., when Henry the Lion raised the *Ville Munichen* from its previous obscurity by establishing a mint within its precincts, and making it the chief emporium for the salt which was obtained from Halle and the neighboring districts. In the 13th c. the dukes of the Wittelsbach dynasty selected Munich for their residence, built the Ludwigsburg, some parts of whose original structure still exist, and surrounded the town with walls and other fortified defenses. In 1327 the old town was nearly destroyed by fire, and rebuilt by the emperor Ludwig of Bavaria, very much on the plan which it still exhibits; but it was not till the close of last century, when the fortifications were razed to the ground, that the limits of the town were enlarged to any extent. The last fifty years, indeed, comprise the true history of Munich. Within that period its population has more than doubled, and its material prosperity been greatly augmented. An international exhibition of power and labor machines was arranged to be held at Munich in 1898. See illus., BAVARIA, vol. II.

MUNICH MANUSCRIPT, or CODEX MONACENSIS, a folio MS. containing parts of the four Gospels and believed to belong to the ninth or tenth century, and now preserved in the library of the University of Munich. It is known among Bible scholars as "X of the Gospels," from its place in the list of uncial manuscripts of the Greek Testament. The text of Matthew, Luke, and John is accompanied by commentaries in cursive letter by Chrysostom and other fathers of the Church, while the part of John's Gospel from II. 22 to VII. 1, has been inserted by some writer of the twelfth century. It is in poor condition, and, in some parts of its text, unsatisfactory. It was collated by Scholz, Tischendorf, and Tregelles. A memorandum states that it was taken from Rome to Ingolstädt, Innspruck (1757), Landshut, and thence to Munich.

MUNICIPAL ARCHITECTURE, the style of the buildings used for municipal purposes, such as town-halls, guild-halls, etc. These were first used when the towns of the middle ages rose in importance, and asserted their freedom. Those of north Italy and Belgium were the first to move, and consequently we find in these countries the earliest and most important specimens of municipal architecture during the Middle Ages. It is only in the "free cities" of that epoch that town-halls are found. We therefore look for them in vain in France or England till the development of industry and knowledge had made the citizens of the large towns so wealthy and important as to enable them to raise the municipal power into an institution. When this became the case, in the 15th and 16th centuries, we find in these countries abundant instances of buildings erected for the use of the guilds and corporations and the municipal courts. Many of these still exist along with the corporate bodies they belong to, especially in London, where the halls are frequently of great magnificence. Many of these corporation halls have recently been rebuilt by the wealthy bodies they belong to, such as the fish-mongers, merchant tailors, goldsmiths, and other companies. Municipal buildings on a large scale for the use of the town councils and magistrates have also been recently erected in many of our large towns, which had quite out-grown their original modest buildings; and now no town of importance is complete without a great town-hall for the use of the inhabitants.

Municipal buildings always partake of the character of the architecture of the period when they are erected; thus we find in Italy that they are in the Italian-Gothic style in Como, Padua, Vicenza, Venice, Florence, etc., during the 13th, 14th, and 15th centuries. In Belgium, during the same period, they are of the northern Gothic style, and are almost the only really fine specimens of the civil architecture of the middle ages we possess. The cloth-hall at Ypres, and the town-halls of Brussels, Louvain, Bruges, Oudenarde, etc., the exchange at Antwerp, and many other markets, lodges, halls, etc., testify to the early importance of the municipal institutions in Belgium.

It is a curious fact that in France, where the towns became of considerable importance during the middle ages, so few municipal buildings remain. This arises from the circumstance that the resources of the early municipalities of France were devoted to aid the bishops in the erection of the great French cathedrals, and the townspeople used these cathedrals as their halls of assembly, and even for such purposes as masques and amusements.

Of the English corporation halls, those which remain are nearly all subsequent to the 14th c., from which time to the present there are very many examples. The guild-hall of London is one of the earliest. The present building was begun in 1411, and was built chiefly by contributions from the trades "companies" of London. Of the town-halls recently erected, those of Manchester, Liverpool, and Leeds are amongst the most important.

Until within very recent years the municipal architecture of the United States was a monotonous reproduction of classical types, without due regard to the uses for which the buildings were to be put, and too often without regard to their situation. The Produce Exchange and Jefferson Market Court and Prison in New York City, and the new city halls in Philadelphia and San Francisco are good examples of modern structures. The City Hall, New York, built 1803–12, at a cost of $500,000, is a good example of the Italian style, and has three of its sides constructed of marble, the back being built of brown stone, partly, it is said, because it was then the prevailing belief that the city would never extend north of that edifice. Brooklyn has an imposing City Hall of white marble, in the Ionic style, surmounted by a belfry. The new City Hall in Philadelphia, the largest public building in America, is built of white marble, in the Renaissance style, and cost about $15,000,000. Its length is 486½ ft., its width, 470 feet, and the apex of its dome is nearly 300 feet above the pavement. Its area, exclusive of the courtyard, is nearly 4½ acres. The City Hall in Baltimore, built of marble in the Composite style, is 225 feet by 140 feet, covers an entire square, and cost $2,271,135. The City Hall, Boston, built of Concord granite, in the Italian Renaissance style, has a dome 109 feet high, and cost $505,691. Buffalo, N. Y., has a City and County Hall, of granite, that cost nearly $1,500,000. Municipal Hall, Pittsburgh, cost $750,000. The City Hall, at Detroit, with tower 180 feet high, cost $600,000. The Chicago City Hall and Court House cost $5,000,000. The City Hall at Louisville, Ky., cost $500,000. The Court House at St. Louis, built of Genevieve limestone, in the form of a Greek cross, cost $1,200,000. The City Hall and Court House at St. Paul cost $1,000,000. Omaha, Neb., has a United States Post Office and Court House, of Cincinnati freestone, that cost $350,000. The City Hall at San Francisco, situated in a beautiful park, is one of the finest of our municipal buildings, and cost over $4,000,000. Denver, Col., has a Custom House and Post-Office costing $750,000. Houston, Texas, has a City Hall and Market House, 272 feet long by 146 feet wide, containing a hall for public entertainments seating 1300 persons.

MUNICIPALITY, MUNICIPAL CORPORATION (from Lat. *municeps*, from *munus* and *capio*, one who enjoys the rights of a free citizen), a town or city possessed of certain privileges of local self-government; the governing body in such a town. Municipal institutions originated in the times of the Roman empire. The provincial towns of Italy, which were from the first Roman colonies, as also those which, after having an independent existence, became members of the Roman state, though subjected to the rule of an imperial governor, were allowed to enjoy the right of regulating their internal affairs. A class of the inhabitants called the *curia*, or *decuriones*, elected two officers called *duumviri*, whose functions were supposed to be analogous to those of the consuls of the imperial city, and who exercised a limited jurisdiction, civil and criminal. There was an important functionary in every municipality called the *defensor civitatis*, or advocate for the city, the protector of the citizens against arbitrary acts on the part of the imperial governor. In the later ages of the empire, the decuriones were subject to heavy burdens; not compensated by the honor of the position, which led many to endeavor to shun the office. The municipal system declined with the decline of the empire, yet it retained vitality enough to be afterwards resuscitated in union with feudalism, and with the Saxon institutions of Britain. Some cities of Italy, France, and Germany have indeed derived their present magistracy by direct succession from the days of imperial Rome, as is notably the case with Cologne. The bishop, being a shield between the conquerors and the conquered, in many cases discharged the duties or obtained the functions of the *defensor civitatis*. To the north of the Alps, under the feudal system, he became officially the civil governor of the city, as the count was of the rural district. In southern Europe, where feudalism was less vigorous, the municipalities retained a large share of freedom and self-government.

Of the cities of the middle ages, some were entirely free; they had, like the provincial towns of Italy before the extension of the Roman conquests, a constitution independent of any other powers. Venice, Genoa, Florence, Hamburg, and Lübeck all stood in this position. Next in dignity were the free imperial cities in Germany, which, not being comprehended in the dominions of any of the princes, were in immediate dependence on the empire. Most of these cities rose into importance in the 13th c.; and their liberties and privileges were fostered by the Franconian emperors, to afford some counterpoise to the growing power of the immediate nobility. Nuremberg was especially celebrated for its stout resistance to the house of Brandenburg, and the successful war which it waged with the Franconian nobility. In England the more important cities were immediate vassals of the crown; the smaller municipalities sometimes owned a subject superior, sometimes a greater municipality for their overlord.

Under the Anglo-Saxons, the English burghs were subject to the rule of an elective officer called the "portreve," who exercised in the burgh functions similar to those of the shire-reve in the shire. The Norman conquerors recognized the already existing privileges of the towns by granting them charters. Instead of a shire-reve, a viscount was placed by the king over each shire, and a bailiff instead of the former elective officer over each burgh. In the larger towns, the bailiff was allowed to assume the Norman appellation of mayor. The municipal franchise seems to have been vested in all the resident and trading inhabitants, who shared in the payment of the local taxes, and perform-

ance of local duties. Titles to freedom were also recognized on the grounds of birth, apprenticeship, marriage, and sometimes free gift.

In all the larger towns, the trading population came to be divided into guilds or trading companies, through membership of which companies admission was obtained to the franchise. Eventually the whole community was enrolled in one or other of the guilds, each of which had its property, its by-laws, and its common hall, and the community elected the chief officers. It was on the wealthier and more influential inhabitants that municipal offices were generally conferred; and the practice gradually gained ground of these functionaries perpetuating their authority without appealing to the popular suffrage. Contentions and disputes arose regarding the right of election, and eventually the crown threw the weight of its influence into the scale of self-elective ruling bodies. As the greater municipalities grew in strength, we find their right recognized to appear in parliament by means of representatives. The sheriffs were considered to have a discretionary power to determine which towns should, and which should not have this privilege of representation. The sovereigns of the house of Tudor and Stuart acquired the habit of extending the right of parliamentary representation to burghs not in the enjoyment of it, while at the same time, by granting or renewing to them municipal charters, they modeled the constitution of these burghs to a self-elective type, and restricted the right of voting in the choice of a representative to the governing body. During the reign of William III., Anne, and the earlier Georges, the influence of the crown was largely employed in calling new municipal corporations into existence, with the view of creating additional parliamentary support for the ministry in power. The burghs of Scotland had a history much like that of the burghs of England; their earlier charters were mere recognitions of already existing rights, and were granted to the inhabitants at large. In the course of the 14th and 15th centuries, the municipal suffrage fell gradually more and more into the hands of restricted bodies of men, until act 1469, c. 5, gave to the councils the right of appointing their successors, the old and new council together electing the office-bearers of the corporation. This state of things continued till 1833, not without much complaint. In the Scottish burghs, the several trades possessed a much more exclusive monopoly than in England. Along with the outcry for parliamentary reform arose an outcry for municipal reform; and a separate municipal reform act putting an end to the close system was passed for each part of the empire.

Municipal corporations, in the United States, as in Europe, are public corporations established by law for political purposes, and chiefly to exercise local and subordinate powers of legislation for the town or district incorporated. The corporation is not the body of the people, nor is it the officers collectively considered, but rather that legal entity created by the act of incorporation and limited thereby. Distinction must be made between a municipal corporation proper and what are known as *quasi* corporations not created by the motion of the people of the district, but rather as territorial or political divisions of the state, such as counties, and the peculiar New England townships, which are examples of almost pure democracy. The laws regulating the incorporation of English towns and cities have little application to municipal corporations in this country. Here none are founded on common law or royal charter, and but few are based upon prescription. It may be said that they exist only by legislative enactment, and possess no powers not created by the statute. The majority of municipal corporations are created by charter singly, but *general laws* of incorporation have been passed in many states, as Ohio, Iowa, Pennsylvania, Indiana, Missouri, Tennessee, and North Carolina. When the incorporation is single or special, the charter sets out that the inhabitants are constituted a body politic with such a name and style; that by that name they may have perpetual succession, and may use a common seal, sue and be sued, etc. The territorial boundaries are defined and provision made as to the form of government—usually by a council made up of aldermen and councilmen, or by trustees—as to division into wards, qualifications of voters, powers of city council to collect debts and lay taxes, etc. General laws of municipal incorporation as in the states above mentioned, usually start by abolishing all special charters existing, and establish general regulations for the incorporation, government, and regulation of municipal corporations throughout the state. Frequently such laws classify the towns to be incorporated as regards their importance into cities of first or second grade, towns, and villages. To become operative the charter granted by the legislature must be accepted by the body of citizens to be incorporated. Provisions sometimes exist in the constitutions of the states limiting the power of the legislature in granting powers and privileges to towns and cities.

When established, the municipal corporation is not beyond the power of the legislature; thus it has been held that the latter may repeal charter provisions, allowing the licensing of liquor dealers, and even such as relate to police regulations. In other words, the town has no *vested right* in its charter privileges, and they may always be altered or revoked with the important exception that the rights of existing and constitutional creditors must not be disregarded. In the celebrated Dartmouth college case it was strongly intimated from the bench that the legislature could not revoke a grant to municipal corporations in *fee simple*. But the legislature has general control over public property, and may authorize a railroad to occupy the streets of a city, without payment therefor. No exact form of words is necessary to give force to the charter, and the cor-

porations may even be created by implication. The charter may be amended or repealed by either general or special law. The powers given to the municipality are those expressly stated in the charter, such as may fairly be implied therefrom, and such as are essential to the carrying out of the purpose for which the body is created. Where the city is given a discretion upon any point it is not for the courts to say whether such discretion has or has not been wisely used. Thus, if it have power to open new streets or grade old ones when necessary for the welfare of the city, the question of necessity is one for the determination of its own governing body. It has been fully decided that taxes and public funds cannot be seized under execution or by writ of garnishment. *Salus populi suprema lex.*

Among the leading powers of a municipal corporation are the rights of taxation, of eminent domain appointing officers, enacting ordinances, and instituting actions. Many special powers are given as to borrowing money, police regulations, wharves, ferries, giving aid to railroads, entertaining guests, etc. That in all these and other powers the corporation may act freely when there is special enactment in the charter or general law is not a matter of doubt. But how far may they extend their operations without such authority and under a general clause empowering them to act for the *general welfare* of the city? The power to become indebted is often specially limited. The doctrine that cities may aid railroads by the purchase of bonds or otherwise was established by the U. S. Supreme Court in *Olcott* vs. *Supervisors* (1873), on the ground that railroads are *publici juris*. The power to borrow money is implied when necessary to the ends for which the corporation exists. It seems to be the doctrine that the corporate existence can cease only by act of legislature, that is, that the municipality cannot voluntarily surrender its privileges. *Amotion* is the removal of an agent or officer of a corporation before his term is expired, and must be for cause, which, however, may be for other than official dereliction, as for infamous private character. The city government may regulate local elections so as to preserve purity of the ballot without special authority; special tribunals to decide contests are often established by the charter, and courts of law may inquire into the proceedings by writs of *quo warranto* or *mandamus*, unless the legislature has denied such right. As to legal liability, an officer improperly removed may bring suit for damages against the corporations; but the city or town cannot have an action against an officer or agent for damage resulting from an honest mistake on his part.

Corporate meetings are usually provided for by charter, but may be regulated by ordinance. In the peculiar New England township system the meeting is actually an assembly of the whole body of inhabitants; though even there in large cities these meetings are necessarily mere formalities; and in many places true municipal corporations have control over the same territory. Elsewhere the representative system prevails. Notice of time and place of meeting should be given, and it is customary to state the nature of matters to be discussed. Ordinances may be declared void by the legislature if oppressive or in restraint (not regulation) of trade. Of course, if power to enact law is given, power to punish is implied, usually by fine; and it has been held that there is no power of imprisonment except by statutory provision; yet the power of appeal from a municipal to a higher court has been held to satisfy the constitutional right of the citizen to a trial before a jury. Strangers are bound by local ordinances.

The powers of the municipality under a "general welfare" clause are to be interpreted very liberally when the health, peace, or safety of a city are at stake. Contracts may be entered into under the express or implied authority of the statute. Parties contracting with a public corporation are bound to find out the true powers of the latter, and the scope of an agent's authority; but an unathorized contract may be accepted by ratification. Payment is usually by warrant on the treasurer, and if, after being cashed by the latter, the warrant is again put on the market, even though by a regular officer of the city, it is worthless, though in the hands of an innocent third party. Municipal corporations have large powers as to acquiring and disposing of property; conveyance must be under corporate name and seal, a vote in council not passing title. As to the right of eminent domain, most important questions have arisen, and the lines of power are not yet clearly drawn. The constitution of the United States provides that private property shall not be taken for public use except upon just compensation, but manifestly the raising of taxes and the destruction of property under necessary police powers do not come under this head. The rule is that the purpose for which property is taken must be useful, as in water-works, sewers, etc., and not merely ornamental. But public parks have been held necessary to the health and well-being of a city, and the right of eminent domain has been allowed. Proper notice must be given. Unjust assessment of damages may be brought before a court by writ of *certiorari*. The damages are usually assessed by commissioners; in New York by "a jury, or not less than three commissioners appointed by a court of record." It has been held that the power of legislatures to place railroads in public streets may be delegated to municipal authorities. In assessment for street improvements it is very common to equalize the benefits and damages done to property holders, paying compensation to some and assessing others. The privileges both as to eminent domain and taxation which have been granted by legislature to large cities have been dangerously great, and nowhere more so than in the city of New York. In such cities the interests involved are so immense and the danger of corruption so great, that there is a growing desire to restrain the power

of the legislature by constitutional provisions. Officers and agents of the municipal corporation may be proceeded against under writs of *mandamus* if they neglect their duties, or *quo warranto* if they exceed or usurp powers. As to torts, the corporation is not liable when it uses its discretionary powers in good faith, or if it fail to secure perfect execution of its by-laws, or for damage by riotous mobs. But where there has been absolute malfeasance or neglect to perform duties, a suit lies, even though liability is not specified in the charter. Municipal corporations are not insurers against accident, but are liable for neglect, as in defective and unsafe streets, yet it has been held that in New England towns there exists no such liability, unless there be special enactment. Where a private individual was injured by the negligence of a contractor employed by the corporation, the latter was held liable. But it is supposed that either notice of the defect or danger must be given to the city, or else the circumstances must be such as to imply knowledge of the facts by the party concerned.

MU'NIMENT-HOUSE, a strong fire-proof apartment or building suited to contain archives, papers, and other valuables.

MUN'JEET (*Rubia cordifolia* or *munjista*), a species of madder (q.v.), of which the root yields an excellent red dye. The plant differs from the common madder in its more distinctly quadrangular stem, its cordate-oblong leaves commonly in fours, and its red berries. It is a native of India, China, Japan, Central Asia, and Siberia. The root has long been used in India as affording a red dye; and is now an article of export to Europe, as a substitute for madder.

MUNK, Salomon, b. 1805, in Glogau, Prussia, of Jewish parents; studied at Bonn and Heidelberg, and at Paris under Sacy and Chizy; went to Oxford in 1835, in search of the Arabic original of Maimonides; and in 1840 was made custodian of the oriental manuscripts in the Bibliothèque de Paris. He accompanied Montefiore and Crémieux to Egypt, bringing back many valuable manuscripts. He gave up his position in the library in 1850 on account of weakness in the eyes. He wrote Arabic and Hebrew critical books from 1833 to 1852, publishing his *Philosophy and Philosophical Works of the Jews*, in German, in 1852. He d. 1867.

MUNKACS', t. in the county of Bereg, Hungary, situated on an affluent of the Theiss, 70 m. e. by s. of Kaschau. The inhabitants are mostly artisans, and the chief production is hosiery. There are also alum mines, saltpeter-works, and in the vicinity, iron-works and mines of rock-crystal, called Hungarian diamonds. A short distance e. from the town is the fortress (founded in 1359) of Monkacs, now a prison, built upon an isolated height, which although small and insignificant-looking, yet, from its strong walls and advantageous position, has for the last few centuries withstood many a siege. Since the beginning of the present century, it has been used as a state prison. Pop. '90, 10,531.

MUNKACZY, Mihaly, artist, was born of an aristocratic family in Munkacs, Hungary, in 1844. His father lost his estates and finally his life in the revolution of 1848, and young Mihaly was apprenticed to a cabinet-maker. Learning to handle a paint-brush, he began to decorate furniture, and advancing with the encouragement of Samosy, an artist of merit, Munkaczy, obtained eighty florins from the Art Union of Pesth, for a picture, and soon earned enough to study in Munich, Vienna, and Düsseldorf. In 1870 he exhibited in the Paris Salon "The Last Days of a Condemned Man," which at once established his reputation. He then removed to Paris to live, where in 1874 he married, and built a magnificent house. His works include "Christ before Pilate;" "Milton Dictating to his Daughters,' in the Lenox Library, New York City, and "The Pawnbroker's Shop," in the Metropolitan Museum, in the same city.

MUNRO, Hugh Andrew Johnstone, an eminent English scholar, was born in Elgin, Scotland, Oct. 14, 1819. He was educated at Trinity College, Cambridge, and was made professor of Latin in Cambridge University, 1869–72. His editions of Lucretius, 1860–64–66–70, the latter with notes, and his edition of "*Horace*," are exceedingly valuable, as is also his "*Elucidations of Catullus*." He died in Rome, 1885.

MUNSEES, Minsis, or Monseys, a tribe of North American Indians, who resided on the upper Delaware and Minisink rivers. In 1663 they joined the Esopus tribe in an attack upon a Dutch fort for which act they were punished by Gen. Krieger. They laid claim to the territory extending from the Minisink to the Hudson, the head waters of the Delaware and the Susquehanna, and s. to the Lehigh and Conewago. Early in the 18th c., settlers began to encroach upon their lands and drove them back to the Susquehanna. In spite of the efforts of the Moravians to win them, they moved w. through the Iroquois and joined the French at Niagara. Sir William Johnson, with some difficulty, managed to gain them over to the side of the English. After the fall of the French, some of them joined the Moravians, but during the revolutionary war, most of the tribe under Capt. Pipes withdrew to Sandusky and fought for the British. Even after the war they remained hostile, and were not reduced to terms until 1805. In 1808 a portion of the tribe settled on Miami land at White river. Later they joined the Stockbridge Indians near Green bay. In 1839 they were removed to Kansas. The tribe is now nearly extinct. Their language was a dialect of the Algonquin and similar to that of the Delawares.

MUNSELL, Joel, b. Mass., 1808; removed to Albany, N. Y. in 1827, and distinguished himself as a printer, journalist, and author. In 1828 he was the editor of the *Albany Minerva*, and *New York State Mechanic*. He published *Annals of Albany*, 10 vols:

Collections on the History of Albany, 4 vols.; *Every-Day Book of History and Chronology; Chronology of Paper and Paper-making.* His collection of works on printing is the largest ever made in America, and part of it has been purchased for the New York state library. He d. 1880.

MUNSON, ÆNEAS, 1734–1826, b. Conn.; educated at Yale, and studied theology. He was chaplain in a colonial regiment during the French war, after which he studied medicine, and began to practice in 1756. He settled at New Haven in 1760, and attained a high rank in his profession there. He was president of the state medical society, and a professor in the Yale medical school from its foundation.

MUNSTER, the largest of the four provinces of Ireland, occupies the s.w., and is bounded on the n. by Connaught, on the e. by Leinster, and on the w. and s. by the Atlantic. It contains the six counties of Clare, Cork, Kerry, Limerick, Tipperary, and Waterford, and the country is described under these heads. Area, 6,064,579 statute acres. The population of the province, which in 1841 was higher than that of any of the other provinces, was shown to be, in 1881, 1,323,910, or 439,743 less than that of Ulster, now the most populous of the provinces Pop. 1891, 1,172,402.

MÜNSTER, chief t. of the district of the same name, as well as capital of all Westphalia, is situated in 51° 55′ n. lat., and 7° 40′ e. long., at the confluence of the Aa with the Münster canal, 65 m. n.e. of Düsseldorf. The pop. in 1871 was 24,815; in 1895, 57,018, of whom the majority were Catholics. Münster, which is a bishopric, and the seat of a military council, a high court of appeal, and other governmental tribunals, is one of the handsomest towns of Westphalia, retaining numerous remains of medieval architecture, whose quaint picturesqueness is enhanced by the numerous trees and shady allées by which the square and streets are ornamented. Among its churches, of which the majority are Catholic, the most noteworthy are the cathedral, built between the 13th and 15th centuries, and despoiled of all its internal decorations by the Anabaptists; Our Lady's church, with its noble tower; the splendid Gothic church of St. Lambert, in the market-place, finished in the 13th c., on the tower of which may still be seen the three iron cages in which the bodies of the Anabaptist leaders, John of Leyden, Knipperdolling, and Krechting, were suspended, after they had suffered the most horrible martyrdom; and the church dedicated to St. Ludgerus, the first bishop of Münster, with its singular round tower, surmounted by an octagonal lantern. The Gothic townhall possesses historical interest in being the spot at which, in 1648, the peace of Westphalia was signed in a large hall, which has lately been restored, and which contains portraits of all the ambassadors who were parties to the treaty. The palace, built in 1767, is surrounded by fine pleasure-grounds, including horticultural and botanical gardens, connected with the academy; and these, with the ramparts, which, since the Seven Years' war, have been converted into public walks, form a great attraction to the city. Münster is well provided with institutions of charity and benevolence. The old Catholic university of Münster was dismembered in 1818, and its funds apportioned to other educational establishments; and the present academy, which comprises a Catholic theological and a philosophical faculty, is now the principal school. It has a library, a natural history museum, and various collections of art and antiquity connected with it. Münster has one gymnasium, and a number of town schools. The industrial products of Münster include leather, woolen fabrics, thread, starch, and sugar, besides which there are good carriage manufactories, breweries, and distilleries. The city has a chamber of commerce and carries on a large trade in the produce of the country.

Münster was known under the name of Mimigardevorde in the time of Charlemagne, who, in 791, appointed it as the see of the new bishop of the Saxons, at St. Ludgerus. Towards the middle of the 11th c., a monastery was founded on the spot, which in course of time derived its present name from its vicinity to the minster, or monastery. In the 12th c., the bishopric was elevated into a principality of the empire. In the 13th c., the city was incorporated in the Hanseatic league; and in 1532 it declared its adhesion to the reformed faith, notwithstanding the violent opposition of the chapter. During the years 1535 and 1536, Münster was the scene of the violent politico-religious movement of the Anabaptists, when the excesses of these pretended reformers worked a violent reaction in the minds of the people, which had the effect of restoring the prestige of the episcopal power; and although the citizens occasionally made good their attempted acts of opposition to their spiritual rulers, they were finally reduced to submission under bishop Christopher Bernhard of St. Gall, who having, in 1662, built a strong citadel within the city, transferred the episcopal place of residence thither from Koesfeld, where it had been established by earlier bishops. In the Seven Years' war, Münster was repeatedly besieged and taken by both the belligerent parties. The bishopric of Münster, which since 1719 had been merged in the archbishopric of Cologne, although it retained a special form of government, was secularized in 1803, and divided among various royal houses; but subsequently shared in the common fate of other German provinces, and was for a time incorporated with France. The congress of Vienna gave the greater part of the principality to Prussia, a small portion being apportioned to the house of Oldenburg, while Hanover acquired possession of the Münster territories of the mediatized dukes of Aremberg.

MUNTANER', Ramon', 1265–1336, b. Spain. His native town having been burnt by the French in 1285, he became a wandering soldier and minstrel, and for 30 years led an adventurous and eventful life. Returning to Catalonia, he began in 1325 to write the history of the princes of Aragon from the time of James the Conqueror until the coronation of Alfonso IV. This chronicle of great events, of which he was the eye-witness, is valuable as a history of his time and is remarkable for its accuracy, naivete, epic beauty and grace. It remained in manuscript until the middle of the 16th century. The two most ancient editions of the original are at Valencia and Barcelona. The former is entitled *Chronica o Descripcio dels fets e hazanayes del inclyt Rey Don Jaume.* It has been translated into German and French, and Lanz at Stuttgart published an edition of the original in 1844.

MÜNTER, Friedrich Christian Karl Heinrich, 1761–1830, b. Gotha, Germany; educated at Copenhagen and Göttingen. He afterwards continued his archæological researches in Italy, under the patronage of the Danish government. In 1790 he became professor of theology in the university of Copenhagen, and in 1808 bishop of Zealand. He edited the Coptic translation of Daniel, and the statutes of the Templars, and wrote works on the history of Christianity in Denmark, on the inscriptions at Persepolis, and on the religion of the Carthaginians.

MUNTJAK, *Cervus muntjac, Cérvulus vaginalis,* or *Stylocerus muntjac,* a species of deer, abundant in Java, Sumatra, and other islands of the same region. It is about one-fifth larger than the roebuck, which it considerably resembles in form. The horns are remarkable, as there springs from the common base of each an additional horn, which is about 1½ in. in length; the principal horn, which is simple, curved, and pointed, being about 5 in. in length. The female has no horns. The male has large canine teeth or tusks, which also are wanting in the female. Allied species are found in India and China.

MÜNZER, Thomas, one of the leaders of the Anabaptists (q.v.), was b. at Stolberg, in the Harz about 1490, took his degree at Wittenberg as master of arts, and for some time preached the doctrines of the reformation in Zwickau and other places. Ere long, however, he adopted mystic views, and declaimed against what he called the "servile, literal, and half" measures of the reformers, requiring a radical reformation both in church and state according to his "inward light." He proclaimed an entire community of goods, and incited the populace to plunder the houses of the wealthy. Mühlhausen fell for a time under his sway and that of another fanatic named Pfeifer, who joined him. He took an active part in the peasant war, and inflamed the spirits of the insurgents by the wildest speeches and songs; but they were utterly defeated on May 15, 1525, after a severe conflict at Frankenhausen, by the elector John and Duke George of Saxony, the landgrave of Hesse, and the duke of Brunswick. Münzer fled, but was taken and carried to Mühlhausen, where he was beheaded along with Pfeifer and a number of others (1525). He showed no dignity or courage in the closing scenes of his life. See Strobel's *Leben, Schriften, und Lehren Thom. Münzer's* (Nürnb. 1795); Seidemann's *Thom. Münzer* (Dresd. and Leips. 1842); and Heinrich Leo in the *Evangelische Kirchenzeitung* (Berl. 1856).

MUNZINGER, Werner, b. Switzerland, 1832; educated at Bern, Munich, and Paris. In 1852 he entered into business in Egypt, but soon after went on an exploring expedition southward in Africa, and was absent for about 6 years. He was attached to the expedition of Heuglin in 1861, but quitted it when it reached n. Abyssinia, and in company with Kinzelbach explored an unknown territory, and determined the course of the river Gash. In1862 he was placed at the head of the German exploring expedition, succeeding Heuglin, and he endeavored to penetrate to Waday, but was unable to go farther than Kordofan. In 1864 he was appointed British consul at Massowah, and in the Anglo-Abyssinian war he acted as a guide to the English forces, after whose withdrawal he remained at Massowah as consul in the French service. In 1869, while on another exploring expedition to n. Abyssinia, he was attacked by an assassin and dangerously wounded. In 1870 he made a journey to s.e. Arabia, and was appointed governor of Massowah; and the next year he went on a new expedition into the country n. of the Bogos. Besides many contributions to geographical periodicals and the proceedings of geographical societies, he published: *Customs and Laws of the Bogos,* 1869; *East African Studies,* 1864; *The German Expedition into East Africa,* 1865; and a *Dictionary of the Tigre Language.* He d. in Africa, 1875.

MUOTTA VALLEY, a lofty and secluded valley in the canton of Schwyz. Switzerland, through which the Muotta river flows down to lake Lucerne. Its chief place is the village of Muotta, 5 m. e.s.e. of Schwyz. Pop. about 3000.

MURAD V. (Mehemet Murad Effendi), **Sultan of Turkey, b. Turkey, 1840**; son of Abdul-Medjid, late sultan of Turkey. On May 30, 1876, the sultan Abdul-Aziz was deposed from his throne; and on the same day Murad was visited by a high dignitary of the state and informed that he was to become sultan, whereupon he proceeded to the great hall of the Seraskierat and was duly installed. Soon after his accession he discovered his total incapacity to conduct the government in the face of the difficulties by which it was surrounded. He became subject to fits of melancholia and lethargy, from

which it was nearly impossible to rouse him. An eminent physician was sent for to Vienna, who, after an examination, pronounced his patient unfitted by the nature of his malady for the conduct of the difficult and delicate duties of his position. Upon the advice of the physician in question, the ministerial council, after referring the law questions of the case to the Sheikh ul-Islam, decided upon his deposition, which was accordingly effected on Aug. 31, 1876. He was succeeded by a younger brother, Abdul-Hamid, who was proclaimed sultan on the same day.

MURÆ'NA, a genus of malacopterous fishes, of those to which the name eel is commonly given, the whole of the eels being sometimes included in the family *muranidæ*. See EEL. The true *muræna* have no fins except the dorsal and anal, which are low and fleshy. They have one row of sharp teeth in each jaw. The head is very large, and the jaws are moved with great power. The muræna of the Romans, or MURRY (*M. helena*), abounds in the Mediterranean, and is sometimes of large size, four feet or more in length, golden yellow in front and purple towards the tail, beautifully banded and mottled. It is much thicker in proportion to its length than any of the fresh-water eels. Its flesh is white and highly esteemed. It prefers salt water, but can accommodate itself to a fresh-water pond. The ancient Romans kept and fed it in vivaria. The story of Vedius Pollio feeding his murænas with offending slaves is well known. This muræna has been caught on the British shores, but very rarely. See illus., FISHES, vol. VI.

Allied to the genus muræna is the genus *sidera*, found in the Pacific.

MURÆ'NIDÆ. See EEL.

MURAL CIRCLE, an astronomical instrument for taking declinations; consisting of a large circle built against the wall (whence its name), movable on its axis in the plane of the meridian, and with a telescope attached, also in the plane of the meridian, which turns about an axis. The circle is graduated, the whole instrument counterweighted and furnished with an illuminating apparatus for night readings. Readings are made accurate by set-screws and microscopic micrometers. The plane of the limb and the optical axis of the telescope are made parallel to the meridian by leveling and sweeping screws, and the cross lines of the eye-piece should follow a star near the equator their whole length. The instrument being rectified, the height of a star above the horizon is measured by a cup of mercury; the star is observed directly and then by reflexion, the half sum of the readings being the correct angle. The co-latitude of the place is obtained as with the theodolite. As the tube is movable about the circle, reading should always be checked by reiteration; with more than one limb of the circle.

MURAL CROWN, in heraldry, a crown in the form of the top of a circular tower, masoned and embattled. It is meant to represent the crown which was given by the Romans as a mark of distinction to the soldier who first mounted the walls of a besieged town, and fixed there the standard of the army. A mural crown supporting the crest, in place of a wreath, occurs in the achievements of several of the English nobility, and in various grants of arms made in the early part of the present century to officers who had distinguished themselves in the war. Viscount Beresford, in consequence of his gallantry at the battle of Albuera, obtained as crest, issuing out of a mural crown, a dragon's head with its neck pierced through by a broken spear, the head of the spear, point downwards, being held in the mouth of the dragon.

MURAT, JOACHIM, king of Naples, was the son of an innkeeper at La Bastide-Fortunière, near Cahors, in France, and was born there March 25, 1771. He was at first intended for the priesthood, and actually commenced the study of theology and canon law at Toulouse, but entered the army, and, being threatened with punishment for insubordination, deserted, and after spending some time at home, proceeded to Paris, where, it is said, he was for some time a waiter at a café, but soon obtained admission into the constitutional guard of Louis XVI. On the outbreak of the revolution, he was made a sub-lieutenant in a cavalry regiment. His gallantry and his extreme republicanism soon won him the rank of colonel. He attached himself closely to Bonaparte, under whom he served in Italy and in Egypt, signalizing himself in many battles; rose to the rank of general of division (1799); returned with Bonaparte to France; and rendered him most important assistance on the 18th Brumaire, by dispersing the council of five hundred at St. Cloud. Bonaparte now intrusted him with the command of the consular guard, and gave him his youngest sister, Caroline, in marriage. Murat commanded the cavalry at Marengo, where he greatly distinguished himself. On the establishment of the French empire he was loaded with honors. He continued to command the cavalry in the armies led by the emperor, and contributed not a little to the victory at Austerlitz, and to many other victories. In 1806 the newly-erected grand duchy of Berg (q. v.) was bestowed upon him. On Aug. 1, 1808, he was proclaimed king of Naples under the title of Joachim I. Napoleon. He took possession of Naples, but the Bourbons, through the support of Britain, retained Sicily.

Murat possessed the qualities requisite for a general of cavalry rather than those of a king. He was very deficient in political skill and energy; but by the moderation of his government, he won the hearts of his subjects. Even his love of pomp and show, and the theatrical splendor of his equipment, which were a subject of mirth in France and Germany, rather gratified the Neapolitans. He endured with difficulty the yoke of Napoleon.

which left him little but the outward show of royalty. In the expedition against Russia, he commanded the whole cavalry, but on its failure, he returned to Naples, anxious and discontented. He joined the French army again in 1813, but after the battle of Leipzic, withdrew to his own dominions, determined on breaking the French fetters with which he was bound. He concluded a treaty with Austria, and a truce with the British admiral, and promised the allies an auxiliary corps. He hesitated, however, even after his new course seemed to have been decisively adopted; and finding his position insecure after Napoleon's overthrow, he entered into private communications with him at Elba. On the emperor's return to France, Murat placed himself at the head of an army of 40,000 men, and commenced a hasty war against Austria. He was defeated at Ferrara, April 12, 1815, and again at Tolentino, May 2. With a few horsemen he fled to Naples, where all was insurrection and commotion; thence to the island of Ischia, and found his way to France, whilst his wife and children took refuge in the British fleet. After Napoleon's final overthrow, he found refuge in Corsica, from which he proceeded in a foolhardy manner with a few followers to the coast of Naples, and proclaimed himself king and liberator, but was presently taken prisoner, and after trial by a court-martial, was shot in a hall of the castle of Pizzo, Oct. 13, 1815. See Léonard Gallais, *Histoire de Joachim Murat* (Paris, 1828), and Coletta, *Histoire des Six derniers mois de la Vie de Joachim Murat* (Paris, 1821). His widow assumed the title of countess of Lipona, and resided in the neighborhood of Trieste, where she died in 1839. His two sons went to the United States, where the elder, Napoleon Achille Murat, settled in Florida, and published a number of works on the constitution and politics of his adopted country. He died April 15, 1847. The younger, Napoleon Lucien Charles, married an American lady in 1827, but suffered several reverses in fortune, and Madame Murat was obliged to open a boarding-school for the support of herself and her husband. Twice he attempted to return to France secretly (in 1837 and 1844), but failed on both occasions. The revolution of 1848, however, opened the country to him. He attached himself closely to prince Louis Napoleon; and was in 1849 French ambassador extraordinary at Turin. In 1852 he was made a senator; and in 1853 he received the title of prince. The Italian revolution appeared to present some chances for him, but nothing came of these. He was made prisoner by the Germans at Metz in 1870. He d. 1878.

MURATORI, Ludovico Antonio, a celebrated antiquary and historian, was born at Vignola, near Modena, Italy, Oct. 21, 1672. From a very early period his predilection for historical and literary pursuits began to manifest itself; and, having entered into holy orders, without, however, accepting any ecclesiastical office, his life was devoted partly to the literature of his profession, but mainly to researches in history, both sacred and profane, especially the history of his native country. In his 22d year, he was appointed one of the librarians of the Ambrosian Library at Milan, a post which has since received equal celebrity from a successor not unworthy of the fame of Murat, the illustrious Angelo Mai (q.v.). Here he gave to the world his first publication, a collection of inedited Greek and Latin fragments, under the titles of *Anecdota Græca* and *Anecdota Latina*. But his most import labors were reserved for the capital of his native duchy, whither, in 1700, he was recalled by the duke of Modena, to take charge of the celebrated D'Este library, and of the ducal archives; his only ecclesiastical preferment being that of provost of the Church of St. Mary, at Pomposa. From the date of his return to Modena, Muratori began to devote himself more exclusively to Italian history, especially to the history of medieval Italy; and his labors in this department extended over the greater part of his life. It was not until the year 1723 that the first volume of his great collection, *Rerum Italicarum Scriptores*, appeared, and the work proceeded at regular intervals for nearly 30 years, the last of the 28 folio volumes which compose it bearing the date of 1751. This immense publication, which was produced by the joint contributions of the princes and higher nobility of Italy, embraces a range from the 5th to the 16th c., and contains all the chronicles of Italy during that vast period, illustrated with commentaries and critical notices. It was accompanied by a collection of dissertations illustrative of the religious, literary, social, political, military, and commercial relations of the several states of Italy during the period, in 6 vols. folio, 1738–1742, a work which, although far from being exempt from errors, is still regarded as a treasure-house of medieval antiquities. While engaged in these prodigious labors, Muratori carried on an active literary correspondence with the scholars of the various countries of Europe, and contributed essays not unfrequently to the principal historical and literary academies, of most of which he was a member. He was the first, moreover, to undertake a general history of Italy from the commencement of the vulgar era down to his own time. It is in 12 vols. 4to, and still retains its value as a book of reference, having been continued by Coppi down to the year 1819. In his capacity of archivist of the duke of Modena, he compiled, in 2 vols. folio, the *Antiquities of the d'Este Family* (1710–40), as well as a series of historical and polemical treatises on certain territorial questions in dispute between the house of Modena and the court of Rome. To the department of classical scholarship, Muratori's collection of *Inscriptions* (6 vols. folio, 1739–43), which, in this point of view, was a necessary supplement to the collection of Gruter and the other antiquaries who had preceded him, is still acknowledged as a most important contribution; and he has also left works of standard merit in the departments of jurisprudence,

of literary criticism, of poetry, of biography, and even of the history of medical science. In the studies of his own profession, as well liturgical and historical, as dogmatical and even ascetical, Muratori, although he did not follow the method of the schools, was hardly less distinguished than if he had made these the pursuit of his life. Some of his opinions were regarded with disfavor, if not directly condemned; but his vindication of himself, addressed to the learned pope Benedict XIV., drew forth a warm and honorable testimony to the uprightness of his motives, which, without approving of the opinions to which exception had been taken, declared them free from the imputation of being contrary either to the doctrine or to the discipline of the church. Although Muratori's life was essentially that of a scholar, yet his exactness in discharging the duties of a parish priest was beyond all praise, and several of the existing charitable institutions of Pomposa were founded by him. He died at Modena, Jan. 23, 1750, in his 78th year. His works, which it would be tedious to enumerate in full detail, fill 46 vols. in folio, 34 in 4to, 13 in 8vo, and many more in 12mo. Some of these are posthumous, and were published by his nephew, G. F. Muratori, from whom we also have a life of his distinguished uncle, in 4to, printed at Omer, 1758.

MURATORIAN FRAGMENT, or Canon of Muratori, a very important treatise of Biblical MSS. It probably belongs to the latter half of the 2d century. It is valuable as affording evidence concerning the writings which were regarded as canonical by the churches of that day. It contains as such the gospel of Luke—which it calls the third, the existence of the first two being implied—the gospel of John, the Acts of the Apostles, 13 epistles of Paul, 1 of Jude, 2 of John, the revelations of John and Peter; the latter, however, as being not universally acknowledged. The epistles of James and of Peter, and the epistle to the Hebrews, are omitted. It was brought into notice by Muratori, a distinguished archæologist, at the close of the 17th century.

MURAVIEF, an ancient boyar family, originally of Moscow, which in 1488 was presented by Ivan Vasiliévitch I. with large estates in the province of Novgorod. Many members of this family took an important part in the military, literary, and political history of their country during the 18th and 19th centuries. The following are the most distinguished:—(1.) *Nikolaï Ieroféiévitch* was capt. in the engineer corps, and in 1752 published the first work on algebra in the Russian language. Under Catherine II. he had charge of the Russian topographical works, became lieut.gen. and governor of Livonia, and died at Montpellier in 1770.—(2.) *Mikhaïl Nikititch* (1757–1807). At the age of 28, Catherine II. took him from the imperial guard to tutor her grandchildren, the grand dukes Alexander and Konstantin, for whom he composed works in prose and poetry distinguished for pure style and noble sentiments. In 1796 he became curator of the university of Moscow, in 1802 senator, and in 1804 councilor of state. His works were published in 1820 in three volumes.—(3.) *Nikolaï Nasarovitch,* privy councilor, secretary of state, and until 1832 director of the imperial private chancelry, was also known as a writer. His works are published in St. Petersburg in five volumes.—(4.) *Nikolaï Nikolaïévitch* (1768-1840). He studied at the university of Strasburg, and on his return to Russia became a lieut. in the marine service. In the battle of Rotschensalm he was wounded and taken prisoner. Set at liberty by the peace of Verelä, he left the marine for the army, was appointed lieut.col., and founded near Moscow a private school for the officers of the general staff. He served in the campaigns of 1812–14 as col. and chief of staff under Count Tolstoï, arranged with Gen. Dumas for the capitulation of Dresden, and shortly after took part in the siege of Hamburg. He then returned with the rank of major-general to his school, which in 1816 was declared to be imperial, and which he directed until 1823. During the last years of his life he became interested in agricultural pursuits and rural economy. He was one of the founders and most active members of the economic society of Moscow, and published a translation of Thaer's *Principles of Rational Agriculture.* He left five sons, all of whom became distinguished.—(5.) *Alexander Nikolaïévitch* (1792–1864), the eldest son of the preceding. In 1825 he took part in the conspiracy which broke out at the accession of Nicholas I. In consideration of his father's services his life was spared, and he was merely exiled to Siberia. Though he was afterwards permitted to return, his services were not required until the Crimean war, when he became maj.gen. and in 1856 governor of Novgorod. He was interested in the emancipation of the serfs. At the time of his death he was lieut.gen. and member of the senate of Moscow.—(6.) *Nikolaï Nikolaïévitch* (1793–1866). He entered the army in 1810, took part in all the campaigns of 1812–15, and won distinction for bravery at Borodino, Lutzen, Bautzen, Kulm, Leipsic, and under the walls of Paris. In 1817 he was attached to gen. Iermolof's staff, and served in the Caucasus. In 1822 he published his *Travels in Turkomania and Khiva,* which was translated into German, English, and French. In 1827 he became chief of staff under Gen. Paskiévitch, took part in all the principal battles of the war with Persia, was promoted to the rank of maj.gen., and won great distinction at Kars and Akhalzik in the war of 1828. In 1830 the Polish rebellion broke out, and Muravief was recalled from an expedition against the Lesghians to take command of the Lithuanian grenadier brigade, with which he defeated the old Polish Gen. Siéravski, near Kazimierz. Promoted to the rank of lieut.gen., he commanded the right wing at the storming of Warsaw in 1831, and captured the fortifications of Rakoviec. At the end of the next year he was sent to Egypt with special

instructions to incite Mehemet Ali to revolt against the Turkish government. He then took charge of the Russian forces which landed on the shores of the Bosporus. In 1838 he fell into disgrace, and lived secluded for ten years, at the end of which he was called again into active service, and in 1854 was made commander of the expeditionary forces in the Caucasus. After a siege which lasted from the first of June till the last of November, he captured the important fortress of Kars. This victory, which partially redeemed the loss of Sevastopol, brought Muravief the title of prince and the appellation Karski. He was then made a state councilor, and put at the head of the commission to investigate the abuses committed during the Crimean war. In 1861 he was made chief of the regiment of grenadiers of Samogitia, one of the greatest honors which the czar can accord to generals not belonging to the imperial family.—(7.) *Mikhaïl Nikolaïévitch* (1796–1866). At the age of 15 he was acting professor in the military school founded by his father. In 1813 he fought against the French, and at the conclusion of the campaign returned to his favorite study of mathematics, and translated into Russian Garnier's *Geométrie Analytique*. In 1823 he entered the army, and soon became col. In 1831 he advanced from maj.gen. to the military governorship of Grodno, and showed great activity in repressing the troubles which broke out in his province after the Polish revolution. He afterwards became military governor of Kursk, and entered the civil administration as privy councilor and senator. He was elected president of the Russian geographical society, and caused a great scientific expedition to be sent to Siberia. In 1857 he became minister of the crown lands and president of the council for the administration of the appanages of the state. He devoted his energies to the fostering of agriculture, founded an agronomic academy near Petroosk, but was violently opposed to the liberation of the serfs. In the student riots of 1861 he used such cruel modes of repression as to win universal hatred, and was removed from his functions. The Polish insurrection, however, brought him to the fore, and in 1863 he was named governor-general of Vilna with special honors. He acted with such energy that in a few months the insurrection was entirely put down. The czar, in recognition of his services, made him a count and placed him at the head of the commission to seek out and punish the accomplices of Karakasof, who attempted the assassination of Alexander II., in 1866.—(8.) *Nikolaï Nikolaïévitch*, b. 1810; entered into the army, served in the Caucasus, and by his bravery won the rank of maj.gen. and commander of the coasts of the Black sea. In 1847 he was named governor-general of eastern Siberia and made lieut.gen. He gained for Russia the entire territory of the Amur, and concluded the treaty of Aigun, May 28, 1858, by which this country was definitely ceded by China. His services were rewarded by the title of count and the name Amurski. In the summer of 1859 he went with twelve ships to Yedo, and concluded a favorable treaty with Japan. He then returned to St. Petersburg by way of Siberia. He resigned his governorship in 1861, and was named member of the imperial council.—(9.) *Andréi Nikolaïévitch* entered, at an early age, the civil administration; became councilor and kammerjunker, and about 1830 undertook a journey to Syria and Palestine, which he described in his *Pilgrimage to the Holy Places*. He subsequently traveled in his own country, in Italy, and in the east, and published the results of his observations in several volumes. He wrote also besides many theological and dramatic works, a *History of the Bible*, *History of the First Four Centuries of Christianity*, *History of Jerusalem*, *History of the Russian Church*, *Description of Georgia and Armenia*, etc. He was a member of the holy synod.—A branch of the Muravief family, about 1730, married a daughter of Apostol, the hetman of the Cossacks, whose name was added to his own.—(1.) *Ivan Matviéivitch* Muravief-Apostol (1769–1851). Under the emperor Paul, Ivan was sent to the courts of Saxony and Madrid, and on his return became privy councilor and senator. He had a thorough knowledge of the ancient and modern languages, and translated into Russian Sheridan's *School for Scandal*, the *Satires* of Horace, and the *Clouds* of Aristophanes. In 1820 he traveled in the Taurid, and published the results of his archæological investigations. His old age was saddened by the political ruin of his three sons, whom he survived for more than a quarter of a century.—(2.) *Sergii Ivanovitch* was lieut.col. of the regiment of Tchernigof, a man of remarkable energy and learning, and the leading spirit in the Dekabrist conspiracy of 1825. Despite the news of the failure of the rising in St. Petersburg, he proclaimed the grand duke Konstantin emperor, and seized the town of Vasilkof. Troops were sent against him, and, after a gallant resistance, in which he was wounded and his brother Ippolit was killed at his side, he was captured, taken to St. Petersburg, and hung in July, 1826. His other brother Matvéi was also a Dekabrist, and was sent to Siberia for twenty years.

MURCHISON, Charles, 1830–79; b. Jamaica, of Scotch descent. He studied at the university of Aberdeen from 1845 to 1851, obtaining a prize for Greek scholarship, the Balfour medal for skill in plant dissection, and the Thompson prize. After graduating at the medical school in 1851 with high honors, he went to Turin, as physician to the British embassy. On his return in 1852 he resided a short time in Edinburgh, studied in Dublin and Paris, and then accepted the position of professor of chemistry in the Calcutta medical college. He remained in India until 1855 and published a treatise on the diseases of that country. He then returned to England, and in London was connected as lecturer, demonstrator of anatomy, assistant physician, or managing physician with the Westminster general dispensary, St. Mary's, King's College, Middlesex, and the

London Fever hospitals. Besides many medical and scientific contributions to the *Lancet* and other journals, he published several treatises, the most important of which were *Diseases of the Liver* and *Continued Fevers of Great Britain*. In 1871 he was appointed professor of the principles and practice of medicine, and though his practice was very large and his published works of great scientific value, yet probably his highest claim to fame arises from his precision, power, and thoroughness as an instructor. In 1877 he was made president of the pathological society.

MURCHISON, Sir RODERICK IMPEY, geologist and geographer, was born at Tarradale, Ross-shire, in 1792. He was educated at the grammar-school, Durham, and having a bias for military life, next studied at the military college, Marlow. He entered the army at an early age, and served as an officer in the 36th regiment in Spain and Portugal. He was placed on the staff of his uncle, Gen. Sir Alexander Mackenzie, and then obtained a captaincy in the 6th dragoons. Quitting the army in 1816, he devoted himself to science—more especially to geology. He afterwards traveled in various parts of the globe. He found the same sedimentary strata lying in the earth's crust beneath the old red sandstone in the mountainous regions of Norway and Sweden, in the vast and distant provinces of the Russian empire; and also in America. The result of his investigations was the discovery and establishment of the Silurian system, which won for him the Copley medal of the Royal Society, and European reputation as a geologist. His subsequent exposition of the Devonian, Permian, and Laurentian systems increased and confirmed his reputation. He explored several parts of Germany, Poland, and the Carpathians; and in 1840 he commenced a geological survey of the Russian empire, under the countenance of the imperial government. M. de Verneuil was associated with him in this great work, completed in 1845. Struck with the resemblance in geological structure between the Ural mountains and the Australian chain, Murchison, in his anniversary address in 1844, first predicted the discovery of gold in Australia. In 1846, six years before that metal was practically worked, he addressed a letter to the president of the Royal Geological Society of Cornwall, inciting the unemployed Cornish tin-miners to emigrate and dig for gold in Australia. He was elected president of the British Association for the Advancement of Science in 1846; president of the Royal Geographical Society in 1844 and 1845; was re-elected in 1857, and continued to hold that post till 1870, when he was compelled to resign it by paralysis. His anniversary addresses to the geographers were of great interest and value. Perhaps no man of the present century has done more to promote geographical science at home, and kindle the spirit of adventure among those engaged in Arctic explorations on the one hand and African discovery on the other. In 1855 he succeeded sir H. de la Beche in the office of director of the Museum of Practical Geology. He was a D.C.L. of Oxford, LL.D. of Cambridge, and a vice-president of the royal society. He was knighted in 1846, made K.C.B. in 1853, and a baronet in 1863. From the emperor of Russia he received the Grand Cross of St. Anne, and also that of St. Stanislaus. He died Oct. 22, 1871. The greater portion of his contributions to science were published in the *Transactions* of the geological and other societies. His principal works were *The Silurian* (1836); *The Geology of Russia in Europe and the Ural Mountains*, in 1845 (2d ed. 1853). He also published volumes on the *Tertiary Deposits of Lower Styria, etc.* (1830), the *Geology of Cheltenham* (1834), etc.—See *Life of Sir Roderick Murchison*, by Archbishop Geikie, LL.D. (1875), and obituary notice by sir Henry Rawlinson in *Proceedings of the Royal Geographical Society*, vol. xvi. No. 4.

MURCHISONIA, a genus of fossil gasteropodous mollusca belonging to the family *Haliotidæ* and so named in honor of sir R. I. Murchison. The genus consists of at least 50 species, all which are characteristic of the paleozoic rocks, occurring in the series from the lower Silurian up to the permian. The shell differs from the large genus *pleurotomaria* only in being very much elongated. Like it, the whorls are sculptured and zoned, the aperture is channeled in front, and the outer lip is deeply notched. See illus., SILURIAN AND DEVONIAN FOSSILS, vol. XIII.

MURCHISON LETTER. See SACKVILLE-WEST.

MURCIA, a former province of Spain, now subdivided into the smaller provinces of Albacete and Murcia, is situated in the s.e. of the peninsula. It is bounded on the n. by New Castile, on the e. by Valencia, on the s. by the Mediterranean, and on the w. by Granada, Andalusia, and New Castile. Area, 10,311 sq. miles. Pop. '83, 692,808 (of modern province, 87,491,436). In the n.e. the province is partly level; but in the s.w. it is composed of great valleys, high plateaus, and mountain ranges. The coast comprises stretches of desert. The principal river is the Segura, which flows through the middle of the province from w. to e. On the whole, Murcia is not very productive, and never will be, on account of the failure of water, partly caused by the destruction of the forests. The only fertile districts are the valleys of the Segura, and the side-valleys of Lorca, Albacete, Chinchilla, and Almansa. The Esparto wastes have remained uncultivated since the banishment of the Moriscoes in 1610; and the canal of Murcia, which is intended to irrigate the arid Campo de Cartagena, is not yet finished. Murcia is one of the most thinly peopled districts of Spain. The north yields wheat and barley; the south maize, fruits, wine, oil, silk, and hemp. Goats, sheep, and swine are reared in great numbers.

In metals, salt, and mineral springs Murcia is abundant; it has also many smelting-works for iron, lead, and copper ores, brimstone, and alum. The roads, however, are in the most wretched condition, and industry in general is still in a backward state. The province was frightfully devastated by a great earthquake, 18–21 March, 1829. Murcia was conquered by the Arabs in 711; after the fall of the caliphate of Cordova it became an independent Arab kingdom, but six years afterwards was subjugated by king Ferdinand III. of Castile in 1241.

MURCIA (the Roman *Murgi*), a large, important, and ancient town of Spain, capital of the province of the same name, on the left bank of the Segura, and near the junction of that river with the Sangonera, 28 m. n.n.w. of Cartagena. It stands in the midst of a beautiful and luxuriantly productive *huerta* or garden, 16 m. in length, and from 7 to 8 m. wide. This *huerta* forms a portion of what is called the vale of Murcia; is well watered, has a bright green appearance even in winter; produces wheat, flax, pulse, and vegetables, and grows innumerable mulberry, orange, fig, and palm trees. The streets of Murcia are narrow but clean, and the houses are gaudily painted in pink and yellow. Its squares are filled with cypress, orange, lemon, and other southern trees. It is the see of a bishop suffragan to Toledo; the cathedral is surmounted by a tower begun in 1522, completed in 1766, and crowned by a dome from which a magnificent view is obtained. The city contains few objects of fine art, a circumstance which is accounted for by the fact that, on the occasion of its siege by Sebastiani, that general, after promising that persons and property should be respected, entered the town April 23, 1810, and rifled it of its wealth and art-treasures. Silks, linens, baskets, mats, and cordage are manufactured, and oil-mills, tanneries, and other works are in operation. Pop. 98,538.

MURDER is the crime of killing a human being of malice aforethought, and is punishable with death. It is immaterial what means are employed to effect the object. Blackstone says that the name of murder, as a crime, was anciently applied only to the secret killing of another, which the word *moërda* signifies in the Teutonic language. And among the ancient Goths in Sweden and Denmark the whole vill or neighborhood was punished for the crime, if the murderer was not discovered. Murder is defined by Coke thus: "When a person of sound memory and discretion unlawfully killeth any reasonable creature in being, and under the king's peace, with malice aforethought, either express or implied." Almost every word in this definition has been the subject of discussion in the numerous cases that have occurred in the law-courts. The murderer must be of sound memory or discretion; i.e., he must be at least 14 years of age, and not a lunatic or idiot. The act must be done unlawfully, i.e., it must not be in self-defense, or from other justifiable cause. The person killed must be a reasonable creature, and hence killing a child in the womb is not murder, but is punishable in another way (see Infanticide). The essential thing in murder is that it be done maliciously and deliberately; and hence, in cases of hot blood and scuffling, the offense is generally manslaughter only. Killing by dueling is thus murder, for it is deliberate. It is not necessary, in order to constitute murder, that the murderer kill the man he intended, provided he had a deliberate design to murder some one. Thus if one shoots at A, and misses him, but kills B, this is murder, because of the previous felonious intent, which the law transfers from one to the other. So if one lays poison for A, and B, against whom the poisoner had no felonious intent, takes it, and is killed, this is murder. Formerly, in England, the benefit of clergy (q.v.) was allowed in cases of murder, till it was abolished by 7 and 8 Geo. IV. c. 28. The only sentence on murderers is now death, which is carried out by hanging. Formerly the murderer was directed after death to be hung on a gibbet in chains near the place of the crime. Formerly, also, dissection was added as part of the sentence, and the execution was to take place on the day next but one after sentence. But now an interval of a fortnight usually takes place, and the body is buried in the precincts of the prison. Attempts to murder were until recently punishable in England like capital felony; but now attempts to murder are punishable only with penal servitude. The common law inferred a wrongful intent to exist from the mere fact of the killing, so that the burden lays upon the defendant of establishing his innocence of malice. Under the definition "with malice aforethought, express or implied," many kinds of homicide which are now considered to involve a much smaller degree of guilt were classed under the one head of murder. By the common law it was murder to secure by perjury the conviction of an innocent person upon a capital charge; but at the present day such a crime would be considered only as a perjury which should receive an aggravated punishment. At the common law, too, the procuring of a person to commit suicide was murder if the suicide was accomplished. So it is said in the books that if two persons agree to commit suicide, and attempt to carry their design into execution, but only one dies, the survivor is guilty of murder if he were present at the commission of the suicide; otherwise he is an accessory before the fact. Both of the above-mentioned cases would probably now be considered as simple manslaughter. According to Hale in his *Pleas of the Crown*, if a person by threats or otherwise cause the death of another by putting him into "a passion of grief or fear," the former is guilty neither of manslaughter or murder; and such is, probably, still the law, though it has been doubted. If a number of persons conspire to commit an unlawful act, in the execution

of which murder is committed, they all are guilty of murder. The only compulsion which can excuse a murder must be an irresistible violence, such as would put a man of discretion and courage into fear for life or limb. There has been considerable controversy as to the burden of proof in cases of murder, and it has sometimes been held that, after the prosecution has shown that the death set out in the indictment was caused by the prisoner, the burden of proof then rests upon him to show justification or want of malice. The evidence relied upon may of course be either direct or circumstantial. In most of the states murder is divided into degrees, and only murder in the first degree is punished capitally. Murder committed deliberately with express malice aforethought, and murder committed, to use the words of the Massachusetts statute, "in perpetrating or attempting to perpetrate, any crime punishable with death, or imprisonment for life," is murder in the first degree; all other murder is in the second degree. The special classes of crime, outside of deliberate premeditated killing, which will constitute murder in the first degree, vary somewhat according to the statutes of each state.

In 1884, for the first time, the question came before the English courts whether the killing of a person from necessity to use his body for food, in order to preserve life, is murder. The case is known as the "Mignonette case," from the name of a vessel involved. Two sailors, wrecked in an open boat, being on the verge of starving, killed one of their companions, and ate part of his body. On being picked up, and brought to England, they were indicted for M.; the facts being admitted, Chief Justice Coleridge, with the assent of the other judges, decided it to be M. Though recognizing the justification of necessity in some cases, the judge said: "It is not correct, therefore, to say that there is any absolute or unqualified necessity to preserve one's life. On the contrary, it is frequently our highest duty to sacrifice it." The prisoners were sentenced to death, but being recommended for mercy, their sentence was changed to six months' imprisonment.

MURDOCK, James, D.D., 1776–1856; b. Conn., of Scotch-Irish descent. At the age of 14 he was left an orphan; graduated at Yale college in 1797; studied theology with Dr. Dwight; was for a short time principal of Hopkins grammar school, New Haven, and for a year of Oneida academy, N. Y.; licensed to preach in 1801; was pastor of the Congregational church in Princeton, Mass., 1802–15; professor of ancient languages in the university of Vermont, 1815–19; professor of sacred rhetoric and church history in the Andover theological seminary 1819–28. In 1829 he removed to New Haven and devoted himself to literary work. His published works are two discourses on the atonement; a translation of Muenscher's *Elements of Dogmatic History;* a translation of *Mosheim's Institutes of Ecclesiastical History,* 3 vols.; *Sketches of Modern Philosophy; a Congregational Catechism;* translation of *Mosheim's Commentaries,* etc.; *The New Testament;* a *Literal Translation from the Syriac Peshito Version*—the latter a very serviceable work. He was an eminent linguist and philologist, and contributed many articles to theological reviews.

MURDOCK, James Edward, b. Philadelphia, 1811; appeared first as an actor in Philadelphia in 1829. In 1833 he appeared with Miss Fanny Kemble, and from that time was a leading actor in tragedy and comedy. In 1838 he left the stage, and opened a school in Boston for mental and physical culture. Returning to the stage he visited California in 1853. In 1855 he went to Europe, and played at the Haymarket theater with great applause. In 1857 he returned to the United States. He has distinguished himself as an elocutionist, and in conjunction with William Russell published *Orthophony, or Culture of the Voice.* He was on the staff of Gen. Rousseau in the war of the secession, attending specially to the sick and wounded; also he gave popular readings in many parts of the country for the benefit of the U. S. sanitary commission. After the war he resided in Philadelphia. He d. in 1893.

MURET, or **MURETUS,** Marc Antoine, 1526–85; b. France; became a proficient scholar in Greek and Latin; and when but 18 lectured on Terence and Cicero in the college of Auch. In 1554 he went to Venice, where he became a friend of Paolo Manuzio, who published some of his books. In 1559, at the invitation of the cardinal Ippolito d'Este, he took up his residence in Ferrara; with him he came to Rome, where he enjoyed the favor of Pius V. and Gregory XIII. He entered the priesthood, was presented to a number of livings, and at the time of his death was professor of civil law. His principal works are *Commentarius de Origine Juris, Commentarius de Legibus,* etc., and *Notæ in Justiniani Institutiones.* In one of his *Orations* he extols Charles IX. of France for having destroyed the Protestant heresy. His Latin poems are fluent and polished, but show little poetical talent. His commentaries on various classical authors are of considerable value.

MU'REX, a Linnæan genus of gasteropodous mollusks, of which has now been formed the family *muricidæ,* belonging to the order *pectinibranchiata* of Cuvier. The sexes are distinct; the animal has a broad foot, often much expanded; the eyes are not on stalks; the shell has a straight canal in front, often prolonged through part of a very long beak; no canal behind. The *muricidæ* all prey on other mollusks, boring through the shells with their hard-toothed proboscis. The name Rock-shell is often given to many species of murex; and some, from the length of the beak, are called Woodcock-shell. Some have the shell beset with long and regularly arranged spines. The whorls of the shell are marked with ridges, or *varices.* Some species of murex are found on the British coasts. Species are found in all parts of the world; the largest are tropical. The ancients

obtained their purple dye (see PURPLE COLORS) from species of murex, particularly *M. trunculus* and *M. brandaris*. The VENUS COMB of the Indian seas is *M. tribulus*, a very delicate and beautiful shell, with many long thin spines. Fossil *muricidæ* are numerous.

MUREXIDE, purpurate of ammonia, or Roman purple, a curious coloring matter obtained from guano. It is similar to the purple dye or Tyrian purple of the ancients, which was made from a species of *murex*—hence its name. Murexide is a product of uric acid, and as this exists in abundance, and in a very free state, in guano, that material has been found one of the best sources from which to obtain it. One process used by Mr. Rumney of Manchester, the chief manufacturer of this material, to produce murexide, is to dissolve uric acid in dilute nitric acid, and after evaporating for some time at a temperature a little short of boiling, whilst still hot, to add a slight excess of ammonia. Two compounds are formed by this process, alloxan and alloxantin, and their mutual reaction on each other results in the formation of the beautiful minute green metallic-lustered crystals of murexide, which, in combination with some of the compounds of lead and mercury, yield most brilliant red and purple dyes. The use of murexide was becoming extensive until the discovery of the aniline colors, the greater brilliancy of which has checked its employment. Murexide is used in printing both cotton and silk goods, under the name of the "Roman-purple style."

MURFREE, MARY NOAILLES, author (better known as CHARLES EGBERT CRADDOCK), was b. about 1850 in Murfreesboro, Tenn., where and at Nashville, she lived until 1882, when St. Louis became her home. Her first published story appeared in the *Atlantic Monthly*, in 1882, and she has since published, among works remarkable for vigor and skillful descriptions of mountain life and scenery, *In the Tennessee Mountains; The Prophet of the Great Smoky Mountains; In the Clouds; The Despot of Broomsedge Cove; Where the Battle was Fought; In the Stranger People's Country; His Vanished Star; The Phantoms of the Footbridge* and *The Mystery of Witch-Face Mountain* (1895), etc.

MURFREESBORO, city and co. seat of Rutherford co., Tenn., situated on a plain 32 m. s.e. of Nashville, 119 m. n.w. of Chattanooga, on the Nashville, Chattanooga, and St. Louis railroad ("Lookout Mountain Route"). It is situated in an agricultural, fruit-growing, and cotton region with healthful climate. From 1819 to 1826 it was the state capital. It contains numerous churches, national banks, saw-mills, a flour-mill, a planing-mill, carriage shops, a tannery, a manufactory of red cedar goods, a court house, Soule college (Bapt.), and Union university (Bapt.), founded in 1841. There are three weekly papers published here. Near the city is the Stone River battlefield park. Pop. '90, 3739.

MURFREESBORO', BATTLE OF, known also as the battle of Stone River, began on Dec. 31, 1862, and ended Jan. 4, 1863, with the flight of the confederates, and the occupation of the town by the union forces. The latter had been reorganized at Nashville by Gen. Rosecrans, and left its position on Dec. 26; forming its line of battle, after a march of five days and constant skirmishing, on the w. bank of Stone river, the left under Crittenden resting on the river, McCook holding the right, and Thomas the center. The confederate army, under Gen. Bragg, was in position on the e. of Stone River, Breckenridge holding the right of the line, Polk the center, and Hardee the left. The battle began on the morning of Dec. 31 with a sharp attack by Crittenden on the enemy's right; but Rosecrans's plans were at once disturbed by his own right being driven in by the confederate left under Hardee. This movement necessitated the abandonment of the original design, and Rosecrans drew in his lines to support the center and right of his position, which became heavily engaged. The union line had lost its ground and 28 pieces of artillery, when nightfall put an end to the fighting for that day. Jan. 1 passed without any serious engagement, but on the afternoon of Jan. 2 the confederates made an attack in force, which was repulsed, and their lines were in turn driven in and badly broken up. There was no fighting on the 3d, and on the following day the confederates evacuated Murfreesboro'. The union strength in this battle was 43,400 men; loss, 1533 killed, 7,245 wounded, 3,000 prisoners. The confederates lost 10,000 killed, wounded, and missing out of 35,000 men.

MURGHAB, a river of Central Asia, which rises on the northern border of Afghanistan, in the Hindu Kush, immediately to the n. of the sources of the Heri (q. v.). The Murgab flows westward, north-westward, and northward. Total length about 260 m.

MURGER, HENRI, 1822–61, b. Paris; received a rudimentary education, and in 1838 became secretary to count Tolstoi, a wealthy Russian nobleman residing in Paris. While in his employ he became ambitious to become a writer, and began by composing satirical poetry. Uniting with a number of young artists, authors, and others of tastes similar to his own, he formed the irregular society or club to which he gave the name "Bohemia"; the associates being termed Bohemians, from their vagrant, gypsy life. They were adventurous and often brilliant, and bound by no ties, social or other. They soon made a name for themselves in Paris, and eventually in general literary history, on account of these features of their character and lives. Murger's reputation was established by the publication, in 1848, of his *Scènes de la Vie de Bohême*, a strikingly characteristic work, marked by independent thought, vigorous language, and occasional pathos. He contributed romance, to the *Revue des Deux Mondes*, and published *Les Nuits d'Hiver*, a volume of poems, besides writing small pieces for the Luxembourg theater.

MURIATIC ACID. See HYDROCHLORIC ACID.

MU'RIDÆ, a family of rodent quadrupeds, containing many genera and a very large number of species, distributed over all parts of the world, and of which rats and mice may be regarded as typical examples. To this family belong also voles, lemmings, dormice, jerboas, marmots, etc. The muridæ are of the section of rodents having distinct clavicles. They have three or four molars on each side in each jaw, the molars at first furnished with rounded tubercles, which wear down till they exhibit mere roughened crowns. The typical muridæ, and those most nearly allied to them, have scaly tails. Marmots, dormice, jerboas, etc., have hairy tails. There are great diversities of structure and habits among the muridæ. All of them feed on vegetable food, but many of them are ready also to eat animal substances. The limits of the family muridæ are very differently stated by different naturalists. The classification of this family of rodents greatly varies. The marmots are there referred to the family, while by many they are placed in the family *sciuridæ* (squirrels). (See MARMOT.) Again, pouched rats and North American gophers are classed by some with the muridæ, but by others are placed in the family *saccomydæ*. See GOPHER, RAT, MOUSE, LEMMING, HAMSTER, MUSQUASH, and VOLE.

MURILLO, BARTOLOMÉ ESTEBAN, was b. at Seville, Spain, and baptized Jan. 1, 1618; and after receiving some education, was placed with his relative, Juan del Castillo, to study painting. Having saved a little money, which he made by painting religious pictures for exportation to South America, he went to Madrid in 1643, being then in his 24th year, was favorably noticed by his celebrated townsman, Velasquez, and through his influence was enabled to study the *chefs-d'œuvre* of Italian and Flemish art in the royal collections. In 1645 he determined to return to Seville, though advised to proceed to Rome by Velasquez, who offered him letters from the king. After settling in Seville, he received numerous important commissions, and was soon acknowledged as the head of the school there. In 1648, Murillo married a lady of fortune; he now maintained a handsome establishment, and his house was the resort of people of taste and fashion. The academy of Seville was founded by him in 1660, but he filled the office of president only during the first year. He fell from a scaffold when painting in Cadiz on an altar-piece for the church of the capuchins, returned to Seville, and soon after died from the injury he received, April 3, 1682. In early life, he painted many pictures illustrative of humble life; in these, the manner was darker and less refined than that exhibited in his later pictures, which are mostly scriptural or religious pieces. In the Louvre, and in England, there are about forty of his works. Sir David Wilkie, who greatly admired and carefully studied the Spanish school, has remarked, in reference to it: "Velasquez and Murillo are preferred, and preferred with reason, to all the others, as the most original and characteristic of their school. These two great painters are remarkable for having lived in the same time, in the same school, painted for the same people, and of the same age, and yet to have formed two styles so different and opposite, that the most unlearned can scarcely mistake them; Murillo being all softness, while Velasquez is all sparkle and vivacity." Among the pictures produced during Murillo's most brilliant period (1661–74) are "Moses Striking the Rock," "Abraham and the Angels," and others executed for the almshouse of St. Jorge. His famous "Immaculate Conception," now in the Louvre, was bought at the sale of Marshal Soult's collection in 1852 for $120,000. There are 105 of his paintings in galleries in London, 61 in Madrid, 59 in Seville, and 21 in Paris. See Curtis, *Velasquez and Murillo* (1883).

MU'RO, a t. of s. Italy, in the province of Potenza, 18 m. w.n.w. of the t. of Potenza. Its castle, built on a height overlooking the ravine, was the scene of the murder of Joanna I., queen of Naples. Pop. 8,900.

MUROM', or MOOROM, a dist. t. in the s.e. of the government of Vladimir, in European Russia, 70 m. e.s.e. of Vladimir, and situated on the left bank of the Oka, a tributary of the Volga. Pop. 13,400. The chief industrial establishments are tanneries and sail-cloth and linen and soap factories. The fisheries on the Oka supply the surrounding country. Murom is also noted for its orchards and kitchen-gardens, the latter of which supply a great portion of Russia with cucumber-seed of the first quality. Gypsum quarries in the neighborhood are extensively worked during winter. There is a large trade in wheat, flax, linseed, and timber. Murom has a very picturesque appearance, and was formerly surrounded by impenetrable forests. It is frequently mentioned in the old national ballads, and is one of the most ancient towns of Russia.

MURPHY, ARTHUR, 1727–1805; b. in county Roscommon, Ireland; educated at St. Omer's college (1740–47), and spent two years in Cork in business. He then went to London and entered upon his career as literary man, dramatist, and actor. From 1752 to 1754 he published a periodical called *The Gray's Inn Journal*, and afterwards a political journal, *The Test*, both unsuccessful. As an actor he appeared at Covent Garden and Drury Lane Theatres, but did not meet with much favor. He now adopted the study of law and began practice in 1757, but once more with little success. He had already published a farce, *The Apprentice*, which had some popularity, and now occupied himself entirely in writing farces and comedies. In this he gained some wealth and a high reputation as a dramatist. Among the most successful of his pieces were: *The Upholsterer; The Way to Keep Him; All in the Wrong;* and *Know your own Mind* In 1792 he

published an essay on Dr. Johnson, and soon after a translation of Tacitus: his life of Garrick was printed in 1801. A few years before his death a pension of £200 and the office of commissioner of bankrupts were bestowed on him by the English government.

MURPHY, Henry Cruse, b. Brooklyn, N. Y., 1810; graduated at Columbia college in 1830; studied law, and was admitted to practice in 1833. He was made city attorney of Brooklyn, and was elected mayor in 1842. He was chosen to congress in 1843; and continued a member of that body during the next six years; being also a member of the N. Y. state constitutional convention in 1846. In 1857 he was appointed minister to Holland, where he remained until 1861, and where he added to his already comprehensive knowledge of Dutch history in its relation to that of the state of New York. Murphy gained distinction, both for his research and his literary skill in this department. He contributed to the periodicals in early life, and translated important writings from the Dutch for the *N. Y. Historical Collections*. He also translated, and published in 1865, specimens of the writings of the early Dutch poets of New Netherlands. He filled the position of president of the New York and Brooklyn bridge company from its formation. He d. 1882.

MURPHY, John, 1786–1841, American politician, graduated at South Carolina college in 1808, was afterwards admitted to the bar. From 1825 to 1829 he was governor of Alabama, to which state he had removed in 1818. He was opposed to the nullification principle and served as a Union Democrat in congress 1833–35.

MURPHY, John Francis, American landscape painter, b. 1853, exhibited at the National Academy in 1876, and was afterwards elected an associate and later an academician.

MURRAIN is the generic term loosely used to designate a variety of diseases of domestic animals, but more correctly restricted to the vesicular epizootic, popularly known as the mouth and foot disease. It is a contagious eruptive fever, affecting cattle, sheep, pigs, and poultry; but rarely communicable to horses or men. It is characterized by the appearance of little bladders or vesicles in the mouth, on the lips, gums, and tongue; on the udder, and in the interdigital space; causing inability to eat, and driveling of saliva, heat and swelling of the udder, and lameness. The disorder runs a fixed and definite course usually in eight or ten days. Good nursing, comfortable lodgings, and a liberal supply of soft, easily digestible food, are the chief requisites for speedy recovery. A laxative may be given if needed. The mouth may be washed out twice daily with a mild astringent solution, which may be made with half an ounce of alum, oxide of zinc, or sugar of lead, to the quart of water. The udder in milch cows, in which the complaint is usually most serious, should be bathed with tepid water before and after milking, which must be attended to very regularly; and the feet kept clean, and washed occasionally with the lotion used for the mouth.

MURRAY, a co. in n.w. Georgia, adjoining Tennessee, bounded on the s.e. by the Coosawattee river, and on the w. by the Connasauga; 410 sq.m.; pop. '90, 8461. Co. seat, Spring Place.

MURRAY, a co. in s.w. Minnesota, drained by Shetek lake in the n., lake Talcot in the s., and other small lakes; 720 sq.m.; pop. '90, 6692, chiefly of American birth. It is drained by the Des Moines and Rock rivers, the Channarambe and Oksida creeks. Its surface stretches out into broad level prairie land, tillable and adapted to grain culture, but nearly destitute of timber. It produces wheat, Indian corn, and oats; and furnishes good pasturage through the year. Co. seat, Slayton.

MURRAY, Alexander, 1755–1821: b. Md.; went to sea as a boy, and when not yet of age was in command of a merchant vessel. In 1776 he was commissioned lieutenant in the navy of the United Colonies, and, no vacancy then existing in the list of ships afloat, he served until the end of 1777 in the army as lieutenant and captain and was present at the battles of Flatbush and White Plains. In the year last named he took command of a privateer, and on several letters-of-marque distinguished himself in many naval combats. He was taken prisoner, exchanged, and served as lieutenant in the *Trumbull*, and in the engagement with the *Iris* was severely wounded and again made a prisoner, exchanged, and once more joined the service as lieutenant of the frigate *Alliance*. In all he was in no less than 13 battles on land and sea. He became captain in 1798, and commanded the *Montezuma* and *Constellation*, being engaged with the latter in the Tripoli war. For some time before his death he had command of the Philadelphia navy-yard.

MURRAY, Alexander, D.D., 1775–1813; b. Scotland; son of a shepherd. In his early life he showed a great desire for learning, and by the family hearth in the evening or amid his flock on the hill-side during the day he read with avidity the few books in his father's house. In 1789 he attended a school at Minnigaff. The next five years were spent in school in summer, teaching the children of the neighboring families in winter. Books were bought or borrowed; grammars and dictionaries of several languages were studied. He obtained a knowledge of the French, Latin, Greek, and Hebrew languages, and of the Anglo-Saxon, Welsh, and Arabic alphabets, and wrote a volume of poems. At the age of nineteen he entered the university at Edinburgh through the assistance of the Rev. Dr. Baird of that city, who had heard of his remarkable proficiency. At the end of two years he began to study for the ministry. He contributed several articles to *Scot's Magazine* and the *Edinburgh Review*. He learned thoroughly all the European languages, and the Geez, Amharic, and Abyssinian dialects. The knowledge of the latter prepared him to edit *Bruce's Travels*, and in three years the edition appeared

in 7 vols., with a life of the author, and copious philological and antiquarian notes. In 1806 he was ordained and installed assistant and successor to the minister of Urr in the stewardcy of Kirkcudbright. In 1811 he was employed to translate a Geez letter, which had been sent to the king from the governor of Tigré. In 1812 he was elected professor of oriental languages in the university of Edinburgh. During that year he published a small work entitled *Outlines of Oriental Philology, comprehending the Grammatical Principles of the Hebrew, Syriac, Chaldee, Arabic, and Abyssinian languages.* He now began a work entitled *History of the European Languages, or Researches into the Affinities of the Teutonic, Greek, Celtic, Sclavonic, and Indian Nations,* but before the end of the first session, his health utterly failed, and he died in the 37th year of his age.

MURRAY, ALEXANDER, b. Penn., 1816; entered the navy in 1835, and was made lieut. in 1847. During the Mexican war he was stationed off the e. coast of Mexico, was wounded at Alvarado, and took part in the capture of Vera Cruz and Tabasco. He was attached to the coast survey 1846–9, and 1857–9. He became a commander in 1862, and the same year was in the engagements off North Carolina—Roanoke Island, Newbern, Kinston, ect. In May of that year he led a naval expedition up the Pamunkey and York rivers. He was made commodore in 1871, and rear-admiral in 1876. He d. in 1884.

MURRAY, DAVID, PH.D., LL.D., b. Delhi, N. Y., 1829; graduated at Union college 1852; was professor and principal of the Albany academy, 1853–63; and 1863–73 professor of mathematics and physics in Rutgers college. In 1873–78 he lived in Japan as an expert to advise the Japanese government in regard to educational methods. He published *Manual of Land Surveying*, and *The Story of Japan* (1894), contributed to Mori's *Education in Japan*, and was the editor of *Outline History of Japanese Education.*

MURRAY, DAVID CHRISTIE, b. Staffordshire, England, 1847, and was educated at a private school. He began his journalistic career as reporter on the *Birmingham Morning News*, then edited by his friend George Dawson. In 1873, Mr. Murray went to London, where he reported for the *Daily News*, also becoming a member on the *World* staff. During the Russo-Turkish War, he acted as special correspondent to the *Scotsman* and the *Times.* In 1879 he published in *Chambers's Journal* his first lengthy work of fiction—*A Life of Atonement.* This was followed by *Joseph's Coat, Val Strange, Coals of Fire, Hearts, By the Gates of Lea, Time's Revenges, In Direst Peril, Why? Says Gladys* and *The Martyred Fool* (1895).

MURRAY, or **MORAY**, JAMES STUART, Earl of, sometimes called the "Good Regent," was the natural son of James V. of Scotland, by Margaret, daughter of John, fourth lord Erskine, afterwards wife of sir Robert Douglas of Lochleven. He was b. about 1533, made commendator of the priory of St. Andrews in 1538, and subsequently of the priory of Mâcon (in France). He joined the reformers in 1556, and almost immediately became the chief of the Protestant party in Scotland. In 1561 he was sent to France, to invite queen Mary to return to her kingdom; and on her arrival he became her prime minister and adviser. In Feb., 1562, he was created earl of Mar; but that earldom having been claimed by lord Erskine, the title of earl of Moray was conferred upon him instead a few months afterwards. Strongly opposed to the marriage of Mary with lord Darnley, July 29, 1565, he endeavored to oppose it by an appeal to arms; but he was easily put to flight by the queen, and obliged to take refuge in England. He did not return to Edinburgh till March 10, 1566, the day after the assassination of Riccio, in which he was an accomplice. In April, 1567 he went to France, but was recalled in August of the same year by the lords in arms against the queen, when he found Mary a prisoner in Lochleven, and himself appointed regent of the kingdom. After the escape of the queen he defeated her forces, May 13, 1568, at Langside, near Glasgow, and was afterwards one of the commissioners sent to England to conduct the negotiations against her. By his prompt and vigorous measures, zeal, and prudence, he succeeded in securing the peace of the kingdom, and settling the affairs of the church, but was assassinated at Linlithgow by Hamilton of Bothwellhaugh, Jan. 21, 1570.

MURRAY, JOHN, the name of three generations of English publishers, will forever remain associated with the palmiest days of English literature in the 18th and 19th centuries. The founder of the house, John M'Murray, was born in Edinburgh about 1745. He obtained a commission in the royal marines in 1762, and in 1768 was still second-lieut., when, disgusted with the slowness of promotion, and panting for a more active career, he purchased the bookselling business of Mr. Sandby, opposite St. Dunstan's church, London, and, dropping the Scottish prefix, became a bookseller and purchaser at "32 Fleet street." He brought out the *English Review*, and published the elder Disraeli's *Curiosities of Literature*, etc. He could himself wield the pen, as some pamphlets remain to testify. He died Nov. 16, 1793, and was succeeded in due time by his son JOHN, who was left a minor of 15 at his father's death. One of the earliest hits of John the second was Mrs. Rundell's cookery-book, which proved to be a mine of wealth—more productive, perhaps, than *Childe Harold* itself. He became connected with Thomas Campbell and sir Walter Scott, and in 1808–9 projected the *Quarterly Review*, a tory organ, in opposition to the Whig *Edinburgh Review*, then in the height of its influence. The first number was published Feb. 1, 1809, under the editorship of William Gifford. The new periodical was completely successful, and brought Murray into communication not only with the chief literati, but also with the conservative statesmen of the time. A still more

fortunate acquaintance was that with lord Byron, whose *Childe Harold* was published by Murray in 1812. Murray now removed from Fleet street to Albemarle street, where the business is still carried on. Here Byron and Scott first met, and here Southey made the acquaintance of Crabbe. Almost all the literary magnates of the day were "four o'clock visitors" in Albemarle street. Byron's pleasant verse has described the scene:

> "The room's so full of wits and bards,
> Crabbes, Campbells, Crokers, Freres and Wards."

Murray's dinner-parties included politicians and statesmen, as well as authors, artists, and dilettanti. Murray paid Byron nearly £20,000 for his works, and his dealings with Crabbe, Moore, Campbell, and Irving were princely. The second John Murray died in his 65th year, in 1843, and was succeeded by his son, JOHN MURRAY the third. Born in 1808, he was educated first at the charter house, and afterwards at Edinburgh university. Many of the greatest works in history, biography, travel, art, and science have issued from the Albemarle street press under the régime of the third Murray. Among his later successes may be mentioned Dr. Livingstone's *Travels* and *Last Journals;* Smiles's *Life of George Stephenson,* and Charles Darwin's *Origin of Species by Natural Selection.*

MURRAY, JOHN, 1741–1815; b. Alton England. At the age of 11 his parents removed to Cork, Ireland. He became a Methodist under the preaching of Wesley and Whitefield. Having read a book by James Relly, a Universalist, he was led to adopt his views. For this he was excommunicated at Whitefield's tabernacle, London. Persecution for opinion, pecuniary embarrassment, and grief for the loss of his wife, made him very unhappy, and he resolved to seek retirement and relief in America. He preached his first sermon in America Sept. 30, 1770, in a small church, in an obscure place in New Jersey, called "Good Luck." Believing fully in the doctrine of universal salvation, he gave himself to earnest labor, first in New Jersey and New York, afterwards in Newport, Providence, Boston, Portsmouth, Norwich, and other places in New England. In 1774 he fixed his residence in Gloucester, Mass., where he was represented as a papist, and a secret emissary of lord North in the interest of the English ministry. He was abused, and by a vote ordered to leave the town, but the interference of powerful friends saved him, and he was allowed to remain. In 1775 he was appointed chaplain of a Rhode Island brigade encamped near Boston. The other chaplains petitioned for his removal, but Washington disregarded the petition, and even showed him marked attention. Ill health required him to leave the army, and he returned to Gloucester, where he was settled over a society of Universalists. Converts to his views multiplied. He was instrumental in the organization of a convention of his sect, which met at Oxford, Mass, Sept. 1785, and took the name of Independent Christian Universalists. In 1787 he visited his native land, and preached in many places with great acceptance and power. Returning before the close of the year, he attended a convention of Universalists held in Philadelphia in 1790. In 1793 he was installed pastor of a society of Universalists in Boston, where he remained the rest of his life. He was buried in the Granary burying-ground, Boston, whence his remains were removed June 8, 1837, to Mount Auburn, where an appropriate monument is erected to his memory. He is regarded as the father of Universalism in America. He published *Letters, and Sketches of Sermons,* with an autobiography, 3 vols. He is described as possessing a "poetical imagination, a retentive memory, warm affections, and a love for all mankind." In his public discourses he spoke with "great grace of oratory, a good choice of words, and a great variety of expression." Except on the one point of universal salvation his views were in harmony with those commonly called evangelical, especially in regard to the proper divinity of Jesus Christ.

MURRAY, LINDLEY, an English grammarian, was b. at Swatara, Lancaster co., Penn., U. S., in 1745. He was educated at an academy of the Society of Friends, and, on his father's removal to New York, was placed in a counting-house, from which he escaped to a school in New Jersey. He then studied law, and was admitted to the bar at the age of 21, and commenced a good practice. During the revolutionary war he engaged in mercantile pursuits with such success as to accumulate a handsome fortune. His health failing, he came to England and purchased the estate of Holdgate, near York, where he devoted himself to literary pursuits. In 1787 he published his *Power of Religion on the Mind,* which passed through seventeen editions. His *Grammar of the English Language* was issued in 1795, and was followed by *English Exercises,* the *Key,* the *English Reader, Introduction and Sequel,* and a *Spelling Book.* There can be no stronger indication how entirely the systematic study of the English language was—until recent years—neglected by scholars, than the fact that Murray's grammar was for half a century the standard text-book throughout Britain and America. Murray wrote an autobiography to the year 1809, which was published after his death, Feb. 16, 1826.

MURRAY, NICHOLAS, D.D., 1802–61; b. Ireland; trained in childhood by his parents and other relatives in the Roman Catholic faith; acquired the rudiments of education in a village school; in his sixteenth year came to New York and obtained employment in the house of Harper & Bros.; 1820 became a member of the Brick Presbyterian Church, and, influenced by the advice of his pastor, Dr. Gardner Spring, prepared for and entered

Williams college, graduating there 1826, and at Princeton theological seminary 1829: in 1830 became pastor of the Presbyterian church at Wilkesbarre, Penn., and, in 1833, of the First Presbyterian church of Elizabethtown, N. J., where—declining numerous calls to important cities north, south, east and west, and two theological professorships—he continued until his death. His personal appearance was attractive and commanding; his winning manners, abundant information, and sparkling wit made him the life of the social circle; his intellect was clear, logical, and comprehensive, and his style simple, racy, and incisive; his preparations for the pulpit were completely and yet so promptly and systematically made that he often had many sermons waiting their turn to be preached; his pastoral visitations were abundant in the abodes of the poor, the chambers of the sick, and the cheerful homes of his people; his correspondence– literary, advisory, and fraternal—was almost unlimited; with untiring industry he contributed ably and constantly to the weekly press; one series of articles, published first in the *New York Observer—Kirwan's Letters to Bishop Hughes*—have obtained a circulation unequaled in religious literature, and have been translated into French, Spanish, Italian, German and Tamil. His other published writings in book form are numerous.

MURRAY, William. See Mansfield, Earl of.

MURRAY, William Henry Harrison, b. Conn., 1840; graduated at Yale college in 1862 and from the Yale theological in 1864, when he became pastor of a Congregational church in Greenwich, Conn., where he remained two years. He then removed to West Meriden in the same state, whence, after two years more, he was called to the Park street church in Boston. His sermons and lectures began at once to attract general attention, and from 1870 to 1874 he was one of the most popular preachers in Boston. During these years he also delivered several lectures in New England and the west, and published *Music Hall Sermons; Camp Life in the Adirondacks; Words Fitly Spoken,* and *The Perfect Horse.* In 1874 he resigned his pastorate of the Park street church, but continued to preach a year or two in Music hall to a congregation which included a part of his former one. In 1876 he established *The Golden Rule,* a religious weekly newspaper. He afterwards became practically interested in the manufacture of carriages, but soon met with losses and mercantile embarrassment. In 1879–80 he was in England, chiefly in Liverpool, engaged in business. In 1880–81 he visited Texas, looking over the state with a view to colonizing enterprises, but he finally removed to Montreal. He has entirely given up the ministry.

MURRAY, William Vans, 1762–1803; b. Md.; studied law in the Middle temple, London, and on his return was chosen a member of the Maryland legislature. He was in congress 1791–97, taking a prominent part in the debates. In 1797 he was appointed minister to Holland, and two years later envoy to France, where, in association with Oliver Ellsworth and William R. Davie, he negotiated a treaty with France, between which and this country there had been a long controversy. He resumed his post at Holland, but resigned in 1801. He published a work on the constitution and laws of the United States.

MURRAY, or **MORAY,** Sir Robert; d. 1673; b. Scotland; entered the French army, in which, by the influence of Richelieu, he obtained the rank of colonel. On his return to Scotland he formed a plan for the escape of Charles I., which came to nothing through the king's irresolution. He is next heard of in 1651, when he was appointed justice-clerk, and soon afterwards he was made a privy councilor and a lord of the session, but he never took his seat upon the bench. He is best known as one of the founders of the Royal Society, which was a continuation of a debating club, which used to meet in London to discuss the "new philosophy," and which obtained a royal charter in 1662.

MURRAY RIVER, the principal river of South Australia. See Australia.

MURSHEDABAD′, a city of British India, capital of a British district of the same name in Bengal proper, is situated on the left bank of the Bhagratti, a branch of the Ganges, about 115 m. n. of Calcutta. On the opposite side of the river stands Mahinagar, usually reckoned a part of Murshedabad. The town occupies a great space, being several miles both in length and breadth, but the buildings are for the most part of mud. It contains two palaces; the one, old and gloomy; the other, constructed after the European style, and of great beauty, was completed in 1840. Situated on the most frequented route by water from Calcutta to the North-West Provinces, the trade of Murshedabad is important. Formerly it was the capital of Bengal. It contains the Palace of the Náwáb, completed in 1837. Pop. '91, 35,600, of whom about 20,800 were Hindus, and 12,600 Mohammedans.

MURVIE′DRO, a small t. of Spain, in the province of Valencia, and 17 miles n.n.e. of the city of that name, on the left bank of the Palancia, and two miles from its mouth. Pop. about 6,500. It stands on the site of the ancient Saguntum (q. v.).

MURZUK′. See Fezzan.

MUSA′CEÆ, a natural order of endogenous plants, the largest of herbaceous plants, generally destitute, or almost destitute of true stems, yet resembling trees in appearance, and sometimes rivaling palms in stateliness; the long sheathing bases of the leaf-stalks

combining to form a false stem. The blade of the leaf has many fine parallel veins proceeding from the midrib to the margin. The flowers are congregated on spadices, which are protected by spathes. The fruit is either a 3-valved capsule or fleshy.—The species are not numerous; they are natives of warm climates, in which they are widely distributed, and are of great value to the inhabitants of tropical countries; the fruit of some, particularly of the genus *Musa*, being much used for food, whilst the fibers of the leaves are employed for cordage and for textile purposes. See PLANTAIN, BANANA, and ABACA. A very interesting plant of the order musaceæ is the traveler's tree (q.v.) of Madagascar.

MUSÄUS, JOHANN KARL AUGUST, a German writer, b. in 1735 at Jena, where he studied theology, was nominated to a country church, but prevented from entering upon the cure committed to him in consequence of the opposition of the peasantry of the parish, who refused to receive him on the ground that he had been once seen to dance. In 1763 he received the appointment of tutor to the pages at the ducal court, and in 1770 he became professor at the Weimar gymnasium. His first literary production, which appeared in 1760, was a parody of Richardson's *Sir Charles Grandison*, which was at that time extravagantly admired in Germany. The success of this satirical squib was complete; but as literary fame did not bring with it a corresponding amount of pecuniary reward, Musäus was compelled to gain his living by other means than writing; and an interval of more than 18 years elapsed before he found leisure to reappear as an author. In 1778 he published his *Physiognomischen Reisen*, in which he endeavored, by a good-natured yet striking satire, to counteract the absurd uses to which the Germans of his day had turned Lavater's system. This, like his previous work, was pre-eminently successful; and, encouraged by the marks of popular favor with which it was received, he laid aside his incognito, and continued to devote himself to authorship. In 1782 appeared his charming version of German folk-lore, under the title of *Volksmärchen der Deutschen*, which professed to be merely a collection of popular tales, noted down from the lips of illiterate old country people; but these tales were tinctured with such a blending of genial humor, quaint fancy, and strong sense, that they have become a classical work of their kind, popular among persons of every age and class. His satirical sketches, entitled *Freund Heins Erscheinungen in Holbein's Manier* (Winterthur, 1785), maintained his reputation as one of the sprightliest and most genial satirists of his country. Under the name of Schellenberg, he began a course of tales, *Straussfedern* (Berl. 1787), which, however, he did not live to complete. He died in 1787. His *Moralische Kinderklapper* appeared the year after his death, while his other posthumous writings were edited in 1791, with an interesting notice of the author, by his relative and pupil, A. V. Kotzebue. Musäus's style was at once correct and elegant, adapting itself with singular flexibility to the various subjects which he handled; while the unaffected geniality and frank loving nature which are reflected in all he wrote, have deservedly made him one of the most popular writers of his day in Germany.

MUSÆ'US, one of the ancient Greek poets of the mythic period, is said to have been the son of Eumolpus and Selene; according to others, the son and pupil of Orpheus. To him was ascribed the introduction of the Eleusinian and other mysteries into Greece, and the ordering of many religious rites. He was among the ancients also the reputed author of a number of poems, oracles, purificatory verses, a war of the Titans, a theogony, hymns, etc.; but of the few verses which remain the authenticity is very doubtful. A later MUSÆUS, who probably flourished about the end of the 6th c. of the Christian era, was the author of a very pleasing amatory poem, in Greek, entitled *Hero and Leander*, discovered in the 13th c., of which the first edition was published by Aldus Manutius about 1494, and of which there have been many subsequent editions.

MUSCADINE GRAPE, a species that grows in the extreme southern states where it is known as the Bullitt grape. The technical term given it by Linnæus is *vitis vulpina*.

MUSCÆ VOLITANTES is the term applied to ocular spectra, which appear like flies on the wing, or floating black spots before the eyes. There are two kinds of muscæ volitantes—the one a perfectly harmless kind, while the other is symptomatic of one of the most serious diseases of the eyes, viz., amaurosis.

Whoever will look through a minute pin-hole in a card at the clear sky may see floating before his sight a number of translucent tubes or fibers, and many little beads, of which some are separate, some attached to the tubes, and some apparently within them. Some of the tubes or fibers are straight, others looped or twisted, and others again forked. All these objects are bright in the middle, and bounded by fine black lines, beyond and parallel to which may be seen an appearance of colored lines or fringes. The doublings and crossings of the loops or knots in the twisted fibers appear as black points. Though the eye be fixed, these bodies change their position with greater or less rapidity. Now, in ordinary light and vision all these objects are imperceptible, unless the knots or fibers happen to be larger than usual, when they constitute the harmless kind of muscæ volitantes. The black lines and fringes are phenomena of the inflexion or diffraction (q. v.) of light, which are never seen except in divergent rays, and all muscæ volitantes having such fringes must be situated at a greater or less distance from the retina; and there are conclusive reasons for believing that they occupy the vitreous humor, and cannot therefore portend amaurosis; whereas those black spots which have no fringes, and which

do not move, or which move only with the motions of the eye, are points in the retina which are insensible to light, and are therefore to be dreaded as symptomatic of danger to vision. To decide, then, whether the muscæ volitantes are or are not indicative of danger, the patient should fix his eye on a white surface (as a sheet of letter-paper) after a sudden shake of the head; if they sink gently downwards, they are innocent. It should perhaps be added, that though they seem to descend, they must in reality be ascending; floating up in the vitreous humor as far as the cellular partitions formed by the hyaloid membrane will permit. See EYE. For further information on the differences between the innocent and the dangerous forms of muscæ volitantes, the reader is referred to an article by sir David Brewster in the *North British Review* for Nov., 1856.

MUS'CARDINE, or SILK-WORM ROT (*Botrytis Bassiana*), a fungus (see BOTRYTIS) which grows on silk-worms, and often kills them in great numbers. It consists of erect branching threads, with clusters of spores at the end of short lateral branches. The spores of this fungus germinate even on healthful silk-worms, and in circumstances otherwise most favorable to their healthfulness. They germinate also on the caterpillars of other lepidopterous insects. When this pest appears among silk-worms, its progress cannot be checked by any means known. For prevention, it is most important that the silk-worms be not overcrowded.

MUSCAT', or MASKÂT, an independent Arab state, forming the sea-cost of Omân, in Eastern Arabia. It extends from the strait of Ormus to the island of Moseirah, and nowhere exceeds 150 m. in width. The coast and interior are both sterile, but the country is studded with very fertile oases. The capital is Muscat; pop., 40,000, on the Persian gulf, a fortified town, surrounded with gardens and date-palms. It has a very good harbor, which, in the winter months, is reckoned the best refuge in the Indian ocean, and is a most important center of trade, where the productions of Europe, of Africa, and of the east are exchanged. The principal exports are Arabian coffee and pearls obtained from the Persian gulf; but wheat, dates, raisins, salt, sulphur, drugs, and horses are also exported. The independence of Omân dates from 751, when the people elected a sovereign of their own. For 900 years the Imaums were elected for personal merit, and afterwards from members of a ruling family. Muscat was taken by Albuquerque in 1507, and remained in the hands of the Portuguese till 1648, when the Arabs recovered possession of it. The Imaums afterwards made extensive conquests in eastern Africa, including Zanzibar, Mombas, Quiloa, etc. In 1798 they acquired possession of the coasts of Laristan and Mogistan, the islands of El Kishim and Ormus, and the town of Bender Abbas in Persia, paying to the shah a rent or tribute of 6,000 tomans. The state was very prosperous under the wise and mild sway of Said Seid, the late Imaum. He ascended the throne in 1803, at the age of 16, and reigned till his death in 1856. He was long a faithful ally of England. In 1854 the Imaums were driven from their Persian dependencies, which in their opinion belonged to them in perpetuity so long as they paid the rental. They recaptured Bender Abbas, but in consequence of English interfence, they were compelled to conclude a treaty with Persia in April, 1856. This is said to have broken the heart of the old Seid, who died Oct. 19, 1856. He appointed his son Majid to succeed him in Zanzibar, and his son Thuwany to succeed him in Muscat. The latter was murdered by his son Salim in 1868, who reigned for a short time, but was driven out by his uncle Sayed Tuky. In consequence of the unsettled state of affairs in Muscat, Persia has assumed the government of Bender Abbas and the Persian coast territory. See ZANZIBAR and WAHABIS.—See *History of the Imaums and Seyids of Omân*, by Sahib-ibn-Razik, from the Arabic, by Rev. G. P. Badger (1781); Markham's *History of Persia* (1874).

MUS'CATEL (Ital. *moscado*, musk), the name given to many kinds of sweet and strong French and Italian wines, whether white or red. Amongst the finest are the white Rivesalt and red Bagnol wines from Roussillon, and the Lunel from the Pyrenees, the Lacrymæ Christi and Carigliano of Naples, etc.

MUSCATINE', a co. in s.e. Iowa, on the Mississippi River; 435 sq.m.; pop. '90, 24,504, chiefly of American birth. It is drained by the Cedar River. Co. seat, Muscatine.

MUSCATINE, city and co. seat of Muscatine co., Ia.; on the Mississippi river and the Chicago, Rock Island and Pacific, and the Burlington, Cedar Rapids, and Northern railroads; 211 miles w. of Chicago. It is built on high bluffs at a bend of the river, and is principally engaged in the various lumber interests. It contains a county hospital, county insane asylum, German Lutheran orphans' home, Y. M. C. A. building, old ladies' home, high school, Leverick normal school, public library, about 20 churches, and national, state, and savings banks, and has electric lights, electric street railroad, waterworks supplied from the river, and several daily and weekly periodicals. There are pork-packing houses, fruit and vegetable canneries, flour mills, one of the largest oatmeal mills in the world, foundries, rolling mills, large saw mills, and sash, door, and blind factories, plumbers' supply factory, etc. Pop. '90, 11,454.

MUS'CHELKALK (Ger. shell-lime), the middle member of the triassic, or new red sandstone period, the beds of which are entirely absent from the British strata. Being typically developed in Germany, the foreign name has been universally adopted to designate them. They consist of (1st) a series of compact, grayish, regularly bedded limestone,

MUSCHELKALK PERIOD.—Nautilus bidorsatus. 2. Encrinus liliiformis; 3, stem ther
7. Equisetum arenaceum. 8. Miophoria pes anseris. 9. Mytilus eduliformis.
14. Rhyncholithus hirundo. 15. Tracks of the Cheirosaurus. 16. Teeth and verte
heterophylla. 19. Charitodon Tschudii.

4. Ceratites nodosus. 5. Ocean in the Muschelkalk period. 6. Terebratula vulgaris. Pemphix Sueurii. 11. Aspidura scutellata. 12. Gervillia socialis. 13. Turbinites dubius. a of the Nothosaurus. 17. Scene in the Keuper (upper division of triassic period). 18. Voltzia

more than 300 ft. thick; and (2d) alternations of limestone, dolomite, marl, gypsum, and rock-salt, nearly 300 ft. thick. The limestone abounds in the remains of mollusca. The paleozoic goniatites are replaced by the ceratites, a remarkable link between them and the secondary ammonities. Ceratites are distinguished by the few small denticulations of the inner lobes of the suture. The heads and stems of lily encrinites (*Encrinus*) are also abundant in these strata, and the remains of ganoid fish have also been met with.

MUSCI. See Mosses.

MUSCICAPIDÆ, a family of birds of the order *insessore* and tribe *dentirostres*, of which the greater number receive the popular name fly-catcher (q.v.). The limits of the family are, however, very variously defined by different ornithologists. The muscicapidæ are mostly inhabitants of the warmer parts of the world, in which they are very widely diffused. The species are very numerous.

MUSCIDÆ, a family of dipterous insects, having a short, thick, membranous proboscis, geniculated at the base, entirely retractile so as to be concealed within the mouth, and terminated by two large lobes (see House-fly); the antennæ three-jointed; the thorax with a transverse suture. The species are very numerous, and universally distributed; among them are the well-known house-fly, blow-fly, etc. The larvæ are maggots (q.v.). Although some of the muscidæ are troublesome, none of them are so much so as species of some other allied families.

MUSCLE AND MUSCULAR TISSUE. Muscular tissue is specially distinguished by its contractile power, and is the instrument by which all the sensible movements of the animal body are performed. When examined under a high magnifying power, the fibers of which it is composed are found to exist under two forms, which can be distinguished from one another by the presence or absence of very close and minute transverse bars or stripes. The fibers of the *voluntary* muscles—or those whose movements can be influenced by the will—as well as the fibers of the heart, are *striped;* while those of the *involuntary* muscles—the muscular structures over which we have no control—as, for example, the muscular fibers of the intestinal canal, the uterus, and the bladder, are *unstriped.*

On examining an ordinary voluntary muscle with the naked eye (a muscle from one of the extremities of any animal, for example), we observe that it presents a fibrous appearance, and that the fibers are arranged with great regularity in the direction in which the muscle is to act or contract (for it is by their inherent power of contracting that muscles act). On closer examination it is found that these fibers are arranged in *fasciculi,* or bundles of various sizes, inclosed in sheaths of areolar tissue, by which they are at the same time connected with and isolated from those adjoining them; and when the smallest *fasciculus* visible to the naked eye is examined with the microscope, it is seen to consist of a number of cylindrical fibers lying in a parallel direction, and closely bound together. These *primitive* (or, as some writers term them, the *ultimate*) fibers present two sets of markings or *striæ*—viz., a longitudinal and a transverse set. The fibers, when separated from each other, frequently split longitudinally into *fibrillæ.* Sometimes, however, when a fiber is extended, it separates in the direction of the transverse striæ into a series of disks. Either cleavage is equally natural, but the latter is the least common. Hence, observes Mr. Bowman, who has specially investigated the minute structure of voluntary muscle, "it is as proper to say that the fiber is a pile of disks as that it is a bundle of fibrillæ; but, in fact, it is neither the one nor the other, but a mass in whose structure there is an intimation of the existence of both, and a tendency to cleave in the two directions. If there were a general disintegration along all the lines in both directions, there would result a series of particles, which may be termed *primitive particles* or *sarcous elements,* the union of which constitutes the mass of the fiber. These elementary particles are arranged and united together in the two directions, and the resulting disks, as well as fibrillæ, are equal to one another in size, and contain an equal number of particles. The same particles compose both. To detach an entire fibrillæ is to extract a particle of every disk, and *vice versa.*" The fibers are supplied with vessels and nerves, which lie in the intervals between them, and are attached by their extremities through the medium of tendon or aponeurosis to the parts which they are intended to move. Aggregated in parallel series, of greater or lesser size, and associated with nerves, vessels, tendinous structures, etc., they form the various muscles which are for the most part solid and elongated, but are sometimes expanded into a membranous shape. The length of the fibers is usually about that of the muscle in which they may occur, and may vary from two feet or more (in the sartorius muscle) to less than two lines (in the stapedius muscle in the middle ear); while their width varies from $\frac{1}{60}$ to $\frac{1}{1500}$ of an inch, being largest in crustaceans, fishes, and reptiles, where their irritability, or property of contracting under the action of a stimulus, is most enduring, and smallest in birds where it is most evanescent. Their average width in man is about $\frac{1}{400}$ of an inch, being about $\frac{1}{352}$ of an inch in the male and $\frac{1}{454}$ of an inch in the female. The average distance between the striæ, or the size of the sarcous elements, in the human subject is $\frac{1}{9400}$ of an inch, the extremes being $\frac{1}{15000}$ and $\frac{1}{6000}$ of an inch, according to the contraction or relaxation of the fiber. The form of the fibers is polygonal, their sides being flattened against those of the adjoining fibers. Each fiber is enclosed in a transparent, very delicate, but tough and elastic tubular sheath, which cannot always be readily seen, but is distinctly shown stretching between the separated fragments of a fiber

which has been broken within it, for its toughness will often resist a force before which its brittle contents give way. This tubular sheath is known as the *sarcolemma* or *myolemma* —the former term being derived from the Greek words *sarx*, flesh, and *lemma*, a skin or husk; and the latter from the Greek words *mûs*, a muscle, and *lemma*.

It was for a long time believed that the contraction of a muscle was associated with a change in the direction of each fiber from a straight line to a sinuous or zigzag course. The investigations of Mr. Bowman, have, however, shown that this view is erroneous. He has proved that in a state of contraction there is an approximation of the transverse striæ, and a general shortening with a simultaneous thickening of the fiber, but that it is never thrown out of the straight line, except when it has ceased to contract and its extremities are acted on by the contraction of adjacent fibers.

Muscles grow by an increase, not of the number, but of the bulk of their elementary fibers; and Mr. Bowman believes "that the number of fibers remains through life as it was in the fœtus, and that the spare or muscular build of the individual is determined by the mold in which his body was originally cast."

The structure of the *involuntary* or *unstriped* muscles must now be considered. This form of muscular tissue most commonly occurs in the shape of flattened bands of considerable length, but of a width not exceeding $\frac{1}{2000}$th or $\frac{1}{3000}$th of an inch. These bands are translucent, and sometimes slightly granular, and are usually marked at intervals by elongated nuclei, which become much more apparent on the addition of acetic acid. Kölliker has shown that every one of these bands or fibres is either a single elongated cell (a fiber-cell) or is a fasciculus of such cells. These fibres have not usually fixed points of attachment like the striated fibres, but form continuous investments around cavities within the body—such as the intestinal canal, the bladder, the uterus, the blood-vessels, etc.—or are dispersed through the substance of tissues, such as the skin, to which they impart a contractile property.

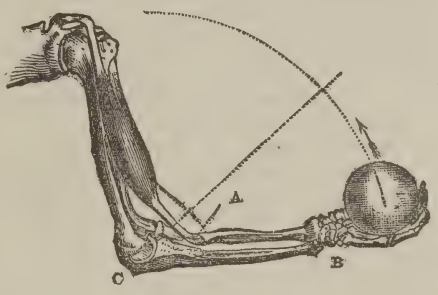
The chemical composition of ordinary (or voluntary) muscle is described in the article Flesh. It is only necessary to add that the fibrillæ, or the sarcous elements of which they are composed, consist of a substance termed Syntonin (q.v.), which closely resembles the fibrine or coagulating constituent of the blood; and that the same syntonin is also the main constituent of the unstriped muscles, or at all events of their fibre-cells. Like the blood-fibrine, it exists in a fluid form in the living tissue, and only coagulates or solidifies after death.

Our limited space prevents even an allusion to the arrangement and distribution of blood-vessels, nerves, and areolar-tissue in muscular structures; and we therefore pass on to the consideration of the muscles and their functions.

Muscles vary extremely in their form. In the limbs they are usually of considerable length, surrounding the bones and forming an important protection to the joints; while in the trunk, they are flattened and broad, and contribute very essentially to form the walls of the cavities which they inclose. There is unfortunately no definite rule regarding the nomenclature of muscles. Muscles derive their names (1) from their situation—as the temporal, pectorals, glutæals, etc.; or (2) from their direction—as the rectus, obliquus, etc., of which there may be several pairs—as, for example, rectus femoris, rectus abdominalis, rectus capitis, etc.; or (3) from their uses—as the masseter, the various flexors, extensors; or, (4) from their shape—as the deltoid, trapezius, rhomboid, etc.; or (5) from the number of their divisions—as the biceps and triceps; or (6) from their points of attachment—as the sterno-cleido-mastoid, the genio-hyo-glossus, the sterno-thyroid, etc. In the description of a muscle we express its points of attachment by the words *origin* and *insertion;* the former being applied to the more fixed point or that towards which the motion is directed, while the latter is applied to the more movable point. The application of these terms is, however, in many cases arbitrary, as many muscles pull equally towards both attachments. Muscles opposed in action are termed *antagonists*, this antagonism being in most cases required by the necessity that exists for an active moving power in opposite directions. Thus, by one set of muscles, the *flexors*, the limbs are bent; while by a contrary set, the *extensors*, they are straightened. One set, termed the muscles of mastication, closes the jaws, while another set opens them; and probably every muscle in the body has its antagonists in one or more other muscles.

The skeleton, which may be termed the locomotive framework, may be regarded as a series of levers, of which the fulcrum is, for the most part, in a joint—viz., at one extremity of a bone—the resistance (or weight) at the further end, and the force (or muscle) in the intermediate portion. In most cases, in order to preserve the necessary form of the body, muscles are applied at a great mechanical disadvantage as regards the exercise of their power; that is to say, a much larger force is employed than would suffice, if differently applied, to overcome the resistance. The two main sources of this disadvantage lie in the obliquity of the insertion, and consequently of the action of most muscles, and in the muscles being usually inserted very near the fulcrum. The first of these disadvantages is in many cases diminished by the enlargements of the bones at the joints. The tendons of the muscles situated above the joint are usually inserted immediately below the bony enlargement, and thus reach the bone that is to be moved in a direction somewhat approaching the perpendicular. If this enlargement did not exist, the contraction of the muscle, instead of causing the lower bone to turn upon the upper one with comparatively little loss of power, would do little more than cause the

two ends of the bones to press upon each other. The second mechanical disadvantage is compensated for by gain in the extent and velocity of movement, and by the avoidance of the great inconvenience of having the muscles extended in straight lines between the ends of jointed continuous levers. Thus the bones of the forearm are bent upon the bone of the arm by the biceps muscle which arises close to the head of the latter, and is inserted at a short distance from the elbow-joint, which acts as the fulcrum of the lever. By this arrangement, a contraction of a single inch in the muscle moves the hand, in the same time, through the extent of about twelve inches, but then the hand moves through every inch with only about the twelfth part of the power exerted by the muscle. By the junction of two or more levers in one direction, as in the different segments of the extremities, the extent and velocity of their united actions are communicated to the extreme one. Thus a blow of the fist may be made to include the force of all the muscles engaged in extending the shoulder, elbow, and wrist.



The great and characteristic property of muscular tissue—that of shortening itself in a particular direction when stimulated—is called *contractility*. The stimulus may be direct irritation by mechanical means, or by galvanism, or by some chemical substance, but in the living body the muscular fibres are, in most cases, made to contract by the immediate influence of the nerves distributed among them, which are consequently termed *motor* nerves (see NERVOUS SYSTEM), and are under the influence of the will. By an exertion of volition, we can contract more or fewer muscles at once, and to any degree, within certain limits; and as a matter of fact, there is hardly any ordinary movement performed in which several muscles are not called in play. But every voluntary muscle is also subject to other influences more powerful in their operation than the will. The movement of the features under the impulses of passion and emotion are more or less involuntary, as is shown by the very partial power the will has of restraining them, and the extreme difficulty of imitating them.

Many movements ensue involuntarily when certain impressions, which need not necessarily be attended with consciousness, are made on the surface of the body, or on any part of its interior, either by external or internal causes Such movements are termed *reflex*, and are noticed in the article NERVOUS SYSTEM. Our space precludes us from noticing the individual groups of muscles in the human body. Several important groups are, however, noticed under ARM, EYE, FOOT, HAND, LEG, etc.

MUSCLE OR MUSSEL SHOALS, an expansion of the Tennessee river in Alabama, about 250 m. from its mouth, where fresh-water mussels are found in great quantities, and a series of rapids make the river unnavigable for nearly 25 miles. During that distance the river falls 100 feet.

MUSCO'GEE, a co. in w. Georgia, bounded on the w. by the Chattahoochee river, which divides it from Alabama, and on the s.e. by Upatoi creek; 244 sq.m.; pop. 27,761, of which the greater part is colored. It is traversed by the Central of Georgia, the Southern, and the Columbus Southern railroads. A part of the soil is very fertile, a part sandy, and portions of the county are covered with forests. The principal products are cotton and corn. The manufacturing interests are large, principally of cotton and woolen goods. Co. seat, Columbus.

MUSCOGEES-INDIANS. See CREEKS.

MUSCOVITE, the most common variety of mica (q.v.); synonyms—Muscovy glass, biaxial mica, oblique mica, potash mica, common mica, *verre de Muscovie*. Trimetric crystallization, usually in hemihedral forms, with a monoclinic aspect; hexagonal prisms; cleavage parallel to the base, and easily separated, forming very thin, elastic plates, which are used in stoves under the name of "isinglass," and in Russia in windows, whence called Muscovy glass. The leaves are sometimes aggregated together in stellate, plumose (plumose mica), or globular forms, or in scales, which are sometimes in masses. Hardness, 2 to 2.5; sp. gr., 2.75 to 3.1 (Dana). Luster, pearly; color, white, gray, pale green, violet-yellow, brown and dark olive-green, and the colors vary in axial and diametral directions. In transmission of light it ranges from transparent to translucent. In general terms it is a silicate of potash and alumina, containing iron, and frequently small quantities of manganese, and hydrofluoric acid (see FLUORINE). A specimen from Uto, analyzed by Rose, gave: silica, 47.50; alumina, 37.30; peroxide of iron, 3.20; peroxide of manganese, 0.90; potash, 9.60; hydrofluoric acid, 0.56; it contained also 2.63 of water. A specimen from Abborfoss contained: silica, 39.45; alumina, 9.27; peroxide of iron, 35.78; magnesia, 3.29; potash, 5.06; fluorine, 0.29; calcium, 0.32, iron, 1.45, manganese, 2.57 = 90.59 (Svauberg). Mica fuses with some difficulty before the mouth of the blow-pipe to a grayish, blebby mass; easily dissolves in borax and phosphorus salt.

Fine crystals of Muscovite occur in granite at Acworth, Grafton, and Alstead, N. H., the plates being sometimes 3 ft. across and perfectly transparent. It occurs in Massachusetts at Chesterfield with albite, and in brown, hexagonal crystals at the Middletown, Conn., feldspar quarry. At Warwick, N. Y., crystals and plates a foot and more in diameter occur in a vein of feldspar. In St. Lawrence co., 8 m. from Potsdam, on the road to Pierrepont, it occurs in plates 7 in. across; and near Saratoga in reddish brown crystals with chrysoberyl; on the Croton Aqueduct, near Yonkers, in rhombic prisms, with transverse cleavage; in fine, hexagonal crystals of dark brown in Chester co., Penn.; in Philadelphia co., smoky brown, with hexagonal internal bands; and at Chestnut Hill, near the Wissahickon, is a green variety. It is found in Maryland, at Jones's Falls, 2 m. from Baltimore, and various other localities, for which see Dana's *Mineralogy*.

MUSCOVY. See Russia.

MUSCOVY DUCK. See Musk Duck.

MUSCULAR FORCE, Origin of. Until the year 1866 the universally accepted theory on this subject was that of Liebig. According to him, non-nitrogenous food is consumed entirely in the production of heat; while muscular energy is due to the waste of the nitrogenous muscular tissue, and therefore of nitrogenous food. Muscular exercise should, if this were the case, cause very distinct increase in the nitrogenous excretions of the body, as well as greater elimination of non-nitrogenous substances.

But the experiments of Fick and Wislicenus, made during an ascent of the Faulhorn, led them to deny altogether the increase of excretion of nitrogen, and to come to the conclusion that the energy generated in the muscles is the result of the burning (oxidation) of non-nitrogenous substances (fats and carbo-hydrates), and not of the burning of the albuminous constituents of muscular tissue; and they conclude that the nitrogenous constituents of muscles are rather to be regarded as forming the machine in which these substances are burned than as being themselves destroyed. (For a translation of their memoir, see *Phil. Mag.*, June, 1866, supplementary number).

Dr. Frankland (*Philosophical Magazine*, Sept., 1866) arrives at the conclusion that the non-nitrogenous constituents of the food, such as starch, fat, etc., are the chief sources of the actual energy, which becomes partially transformed into muscular work. He does not, however, deny to the albuminous matters a co-operation in the production of muscular power, but he regards their chief use as being to renew the muscular tissue. The muscles are thus the source both of animal heat and of muscular energy.

Dr. Parkes, in a long and careful series of experiments (see *Proceedings of the Royal Society*, vols. xv., page 339; xvi., page 44; xix., page 349; and xx., page 402), examined the effect of exercise, both with a non-nitrogenous and with a nitrogenous diet. He found no marked increase, but often a diminution, of the nitrogenous substances excreted during exercise, though subsequently a slight increase took place.

Dr. Pavy, in a series of elaborate experiments recorded in the *Lancet* (Feb., Mar., Nov., Dec., 1876; Jan., 1877), comes to a similar conclusion. He says: "The theoretical deduction to be drawn from the investigation which has been conducted is that, although the elimination of urinary nitrogen is increased by muscular exercise, yet the increase is nothing nearly sufficient to give countenance to the proposition that the source of the power manifested in muscular action is due to the oxidation of muscular tissue."

The theory of muscular action which Dr. Parkes proposes is as follows: During action the muscles appropriate nitrogen; this act is accompanied by changes in the carbo-hydrates, which lead to the manifestation of mechanical force; these changes lead to effete products (lactic acid, etc.) in the muscles, which, as appears from Ranke's experiments, stop their contraction. Then ensues an action of oxygen upon the nitrogenous framework of the muscle, and a removal of the effete products of the carbo-hydrates, so that the muscle becomes again capable of appropriating nitrogen, and of acting.

But, although some such theory as this finds favor with most physiologists, and agrees with most of the experiments on the subject, it is not universally accepted.

Dr. A. Flint of New York made observations on Weston, the American pedestrian, which seemed to show that, in his case at least, the excretion of nitrogen is very distinctly increased, both during and after severe muscular work. He accordingly comes to the conclusion that "the exercise of muscular power immediately involves the destruction of a certain amount of muscular substance, of which the nitrogen excreted is a measure." That is to say, he adheres to the original view of Liebig. His experiments are described in the *Journal of Anatomy and Physiology*, vol. xi., page 109; and his views are developed in the same journal, vol. xii., page 91, where also numerous references are given to other works and papers on the subject.

All observers are agreed that the amount of carbon excreted in the form of carbonic acid is very largely increased during exercise.

Besides the papers named above, the following may be consulted for a *résumé* of the subject: Liebig, in *Pharmaceutical Journal and Transactions*, 1870; Voit, in *Zeitschrift für Biologie*, 1870; Foster, *Text-Book of Physiology*, page 323.

MUSES, in the classic mythology, divinities originally included amongst the nymphs, but afterwards regarded as quite distinct from them. To them was ascribed the power of inspiring song, and poets and musicians were therefore regarded as their pupils and favorites. They were first honored among the Thracians, and as Pieria around Olympus

was the original seat of that people, it came to be considered as the native country of the muses, who were therefore called *Pierides*. In the earliest period their number was three, though Homer sometimes speaks of a single muse, and once, at least, alludes to nine. This last is the number given by Hesiod in his *Theogony*, who also mentions their names—Clio (q.v.), Euterpe (q.v.), Thaleia (q.v.), Melpomene (q.v.), Terpsichore (q.v.), Erato (q.v.), Polyhymnia (q.v.), Urania (q.v.), and Calliope (q.v.). Their origin is differently given, but the most widely spread account represented them as the daughters of Zeus and Mnemosyne. Homer speaks of them as the goddesses of song, and as dwelling on the summit of Olympus. They are also often represented as the companions of Apollo, and as singing while he played upon the lyre at the banquets of the immortals. Various legends ascribed to them victories in musical competitions, particularly over the sirens (q.v.). In the later classic times, particular provinces were assigned to them in connection with different departments of literature, science, and the fine arts; but the invocations addressed to them appear to have been, as in the case of modern writers, merely formal imitations of the early poets. Their worship among the Romans was a mere imitation of the Greeks, and never became truly national or popular. Among the places sacred to them were the wells of Aganippe and Hippocrene on Mount Helicon, and the Castalian spring on Mount Parnassus. See illus., MYTHOLOGY, vol. X.

MUSE'UM (Gr. *mouseion*), originally the name given by the ancients to a temple of the Muses, and afterwards to a building devoted to science, learning, and the fine arts. The first museum of this kind was the celebrated Alexandrian Museum (see ACADEMY). After the revival of learning in Europe, the term museum was sometimes applied to the apartment in which any kind of philosophical apparatus was kept and used; but it has long been almost exclusively appropriated to collections of the monuments of antiquity and of other things interesting to the scholar and man of science. In this sense it began to be first used in Italy, and probably in the case of the famous Florentine Museum, founded by Cosmo de Medici, which soon became a great and most valuable collection of antiquities. Nothing analogous to the museums of modern times existed amongst the ancients, the greatest collections of statues and paintings which were made in the houses of wealthy Romans having been intended for splendor rather than for the promotion of art. The name soon ceased to be limited to collections of antiquities, and sculptures, and paintings; collections illustrative of natural history and other sciences now form a chief part of the treasures of many of the greatest museums, and there are museums devoted to particular branches of science. Of the museums of Britain, the British Museum (q.v.) is the greatest; that of Oxford, founded in 1679, is the oldest.—The Museum of the Vatican, in Rome, contains immense treasures in sculptures and paintings, and also in books and manuscripts.—The Museum of the Louvre in Paris, that of St. Petersburg, and those of Dresden, Vienna, Munich, and Berlin, are amongst the greatest in the world. The usefulness of a museum depends not merely upon the amount of its treasures, but, perhaps, even in a greater degree upon their proper arrangement; and whilst great collections in the chief capitals of the world are of incalculable importance to science, its interests are also likely to be much promoted by those local museums, still unhappily not numerous, which are devoted to the illustration of all that belongs to particular and limited districts. Museums appropriated to the illustration of the industrial arts—their raw material, their machines, and their products—and of everything economically valuable, are of recent origin, but their importance is unquestionably very great. Pre-eminent among institutions of this kind in Britain are the South Kensington Museum in London, and the Museum of Science and Art in Edinburgh. Among the most complete and useful museums in the United States are the National at Washington, the Boston Museum of Fine Arts, and the Metropolitan Museum, New York.

MUSGRAVE, ANTHONY, b. Antigua, 1828; appointed secretary of Antigua, and afterwards administrator of Nevis. He was lieutenant governor of St. Vincent 1861–64, when he became governor of Newfoundland, where he remained till 1869, when he was appointed to the same position in British Columbia. He went out to Natal as lieutenant governor in 1871, was made governor of South Australia in 1873, of Jamaica in 1881, and of Queensland in 1883. He married a daughter of David Dudley Field. He d. 1888.

MUSGRAVE, GEORGE WASHINGTON, D.D., LL.D.; b. Philadelphia, 1804, of north-Irish and German descent; studied at the college of New Jersey and Princeton theological seminary, but was prevented by ill health from taking a degree; entered the ministry in 1828; was pastor of the Third Presbyterian church in Baltimore in 1830–52, and of the North Tenth street church in Philadelphia in 1862–68; was corresponding secretary of the Presbyterian board of publication in 1852–53, and of the board of home missions in 1853–61, and also in 1868–70. Dr. M. was a director of Princeton seminary from 1837, and a trustee of the college of New Jersey from 1859. He d. 1882.

MUSH'ROOM, or AGARIC *Agaricus*, a genus of fungi, of the suborder *hymenomycetes*, having a *hymenium* of unequal plates or gills on the lower side of the *pileus*. The species are very numerous. Many of them are poisonous, many are edible, and some are among the most esteemed fungi. The species most esteemed in America is the COMMON MUSHROOM (*A. campestris*), a native also of most of the temperate regions both of the northern and of the southern hemisphere, and of which a very large and fine variety occurs in eastern Australia. It is found during summer and autumn (but chiefly

in autumn) in pastures, orchards, vineyards, etc. Its *pileus* is regularly convex, becoming almost flat when old; fleshy, dry, white with a tinge of yellow or brown; of a silky smoothness on the upper surface, or somewhat scaly, but never warty; thickly set on the under side with very unequal gills, which in a young state are pink, and afterwards become dark brown. The pileus is attached by its center to the top of the stem. The stem is of a firm fleshy texture, and *towards the top* is surrounded by a more or less distinct white membranous ring, the remains of the curtain or vail (*indusium*), which in a young state extends to the pileus, and covers the gills. This mushroom is gathered for the table when young, being preferred when the vail is still unbroken, and the unexpanded pileus has the form of a ball or button; but both in this state, and afterwards, whilst it shows no symptoms of decay, it is used for making ketchup (q.v.). It has a very pleasant smell and taste, and the flesh, when bruised, assumes a reddish-brown color.—Very similar to it, and often sold instead of it in London and elsewhere, but rejected by all skillful housekeepers as unfit even for making ketchup, is the St. George's Agaric (*A. Georgii*), sometimes called *whitecaps*, frequent in moist pastures and near buildings in all parts of Britain. This species is easily distinguished by its larger size—the pileus being sometimes 18 in. broad—its coarser appearance, its rather disagreeable smell, the yellow color which its flesh assumes when bruised, and the lighter color of its gills.—Care must be taken not to confound the common mushroom with the white variety of *agaricus phalloides*, a species not uncommon in Britain, chiefly in woods and on the borders of woods, which is very poisonous. Perhaps it is the possibility of this mistake which has led to the prohibition of the common mushroom in Rome, where many kinds of esculent fungi are brought in great abundance to the market, and where a special officer superintends the sale of them. *A. phalloides* is, however, easily distinguished by the ring at the *bottom* of the stem, the white color of the gills, the warts on the upper surface of the pileus, and the powerful smell, which becomes extremely disagreeable as the mushroom grows old.—Another species of mushroom much in use for the table is the Fairy-ring Mushroom (*A. oreades*), sometimes called *Scotch bonnets*—the *Champignon* of the French. It is common in pastures in the U. S., Britain and most parts of Europe, often forming fairy rings (q.v.). It is much smaller than the common mushroom, the pileus being seldom more than an inch broad, the stem taller in proportion. The stem is solid, fibrous, and tough, with no ring; the pileus smooth, fleshy, tough, convex, with a more or less distinct boss (*umbo*) in the center, of a watery-brown color; the flesh white. The odor is strong, but agreeable. This mushroom is used for ketchup, and is also dried and powdered for use at table as a savory addition to sauces and stews. It is constantly brought to market in England. It is liable, however, to be confounded with several poisonous species; but only one of them, *A. dealbatus*, forms fairy rings, and this may be readily distinguished by its disagreeable odor, by its becoming grayish-brown in zones when soaked in water, by the margin of the pileus being at first rolled inwards, and by its very fine dingy whitish gills.—The other edible species of mushroom or agaric are numerous, but they are chiefly used on the continent of Europe, and scarcely at all in America, although some of them are common American plants.—The Orange-milked Agaric (*A. deliciosus*), which grows chiefly in fir-woods and among junipers, has a viscid pileus, 4 in. or more broad, at first orange, afterwards pale, the gills and juice orange, the gills running down the stem, the smell and taste agreeable.—The Mousseron (*A. prunulus*) is common in woods and pastures, particularly on sandy soils. It has a pileus about 2 to 4 in. broad, convex, yellowish-white when young, the gills at first white, and afterwards flesh-colored. The odor is agreeable. It is much esteemed on the continent as an article of food.—The Parasol Agaric (*A. procerus*) is found in pastures, especially under trees. It loves sandy soils. It is remarkable for its long stem, 8 to 12 in. high, with a thick spongy ring. The pileus is 3 to 7 in. broad, at first obtusely conic, then bell-shaped, covered with brown scales. The taste and smell are pleasant.—The White Field Agaric (*A. virgineus*) is one of the most common of British species, growing in pastures, with viscid or satiny white or whitish convex pileus, fully an inch broad, stem nearly 2 in. long, and light chocolate-colored distant gills, which run down the stem. It grows either singly or in groups.—The Anise Mushroom, or Sweet-scented Agaric (*A. odorus*), grows in shady woods and dells among moss and decaying leaves. It has a slightly convex pileus, about 3 in. broad, with pale gills. The odor is like that of anise.—The Ivory Mushroom (*A. eburneus*) is found in woods, with pileus 2 to 3 in. broad, of a grayish-yellow color, broad gills, and a rather long and somewhat scaly stem.—The Smoky Mushroom (*A. fumosus*), with pileus smoke-gray above, the gills and stalk yellowish, is common in fir-woods.—All these are edible, and more or less pleasant and nutritious. Finer than most of them is the Imperial Mushroom (*A. cæsarius*), the *Kaiserling* of the Germans, a species found in loamy soils in some parts of Europe, with orange pileus and lighter yellow stem and gills; but, unhappily, it is apt to be confounded with the very poisonous *amanita* (q.v.) *muscaria*.

The common mushroom is frequently cultivated both in the open garden and in houses or sheds. To grow it in the open garden, beds are prepared, generally of earth mixed with horse-dung, partly fresh and partly from old hotbeds, and are raised into ridges almost as high as broad. To grow it in houses, boxes are filled with alternate layers of half-rotten horse-dung and of straw, with a surface layer of fine mold. But of each of these methods there are many different modifications, none of which can here

be detailed. In both, the production of mushrooms is sometimes left to the chance—often almost a certainty—of spawn (*mycelium*) or spores existing in the dung or earth; sometimes, to increase the probability of a speedy and abundant crop, earth is introduced into the bed or box from a pasture known to be rich in mushrooms, and mushroom spawn is also frequently planted, which is either collected where mushrooms grow, or produced by artificial means, often appearing and being propagated extensively without the development of the mushroom itself. The almost certain production of mushroom spawn in heaps of slightly fermenting horse-dung, straw, and earth, has been often urged as an argument in favor of the equivocal generation of fungi, but the minuteness and multitude of the spores may more reasonably be urged. See illus., Mosses, etc.

MUSIC is the art, process, or result of arranging tones (that is, sounds of periodic vibration) into forms of beauty or expressiveness in accordance with certain laws of combination or composition. Its historic development as one of the chief of the fine arts has been almost wholly the result of more or less fortuitous or intuitive processes of experiment and invention undertaken from æsthetic motives. This development has now reached a sufficient maturity to furnish abundant materials for a science of music, the field of which includes everything that is known about the phenomena of musical composition, performance, or appreciation, precisely defined, and arranged in the most logical order possible. The first object of this article will be to present the outlines of this science, although it must be admitted that all parts of the subject are not as yet developed with equal fullness. A second object will be to give also a brief history of the growth of music as a fine art.

The science of music is naturally divided into the following sections: I. The psychological processes involved in the production or reproduction (performance) of music. II. The physical materials, with their laws of relation and interaction, which are available for the use of the musician. III. The elementary or complex arrangements of these materials adopted for artistic purposes; the customary forms and rules of procedure—in short, whatever goes to make up the process of composition, so far as that can be reduced to systematic order. IV. The apparatus or language of written signs, by which the products of composition are noted down for preservation and transmission. V. The processes and appliances of musical reproduction or performance, including both the construction and the manipulation of musical instruments (among which is the singing voice). VI. The physical or the æsthetic apprehension and appreciation of music, including the criticism of its forms in the abstract and of particular compositions in the concrete. VII. The practical application of music to ends outside itself, as, for example, to the economy of public worship, or to hygiene, or to general education. Each of these sections may be studied from three distinct points of view: 1. Systematically, for the formation of a regular body of logical definitions and classifications, that is, a true science. 2. Historically, for a chronological account of the facts of its origin and development in connection with civilization. 3. Pedagogically, for the purpose of presenting it as a matter of instruction in a profitable manner to the mind of a student. Obviously the second and third methods of regarding music should be shaped by the first, if this is practicable.

I. The psychology of musical production is naturally the most obscure branch of musical science; but a few points may be affirmed with some confidence. Certain elementary musical phenomena, like simple tones or simple rhythms, which at first may be capriciously or accidentally produced by the voice or by means of rude instruments, have both to the savage and to the civilized man a sensuous value or charm that invites to their repetition and multiplication merely for the sake of the pleasurable stimulation they induce of the sense of hearing. The effort of such repetition or development leads directly to an intellectual satisfaction in the processes of invention and performance, and to an emotional delight in the result. As the course of development proceeds, it is further discovered that the apparatus of tonal and rhythmical forms thus invented has a capacity for the embodiment or expression primarily of emotion, but also of thought, or, more accurately, of certain abstract forms or formulæ of emotion and thought, to which imagination or some association with speech readily attributes a concrete significance; and that such attempts at the sensuous manifestation of mental states and processes has a reactive and impressive power, which may be exercised for various purposes. The motives to musical production, whether among barbarous, semi-civilized, or cultured peoples, are to be sought in one or the other of these directions, or in some one of the manifold possible combinations of them. The psychological emphasis in the very act of musical production or reproduction vibrates incessantly between the sensuous, the intellectual, the emotional, and the volitional motive; and of course the complex processes of such a highly elaborated fine art as modern music cannot be exhaustively analyzed in a given case. It is only fair to say, however, that the mental aspects of musical creation and performance are now by no means as mysterious and inscrutable as in the old days, when the bard and the minstrel stood in the same superhuman rank with the magician and the seer.

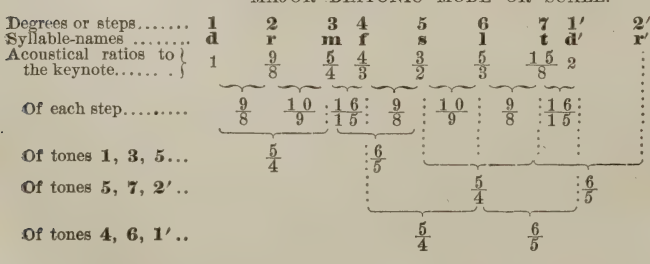
II. The investigation of the laws of the physical material of music is a branch of the science of sound or acoustics. Sounds that are produced by periodic vibrations are called *tones*, other sounds are *noises*. Music finds its special material in tones; noises it uses only for rhythmic purposes, or as they occur in the spoken words of song.

Tones have three essential characteristics: *pitch* depending on the relative rapidity of the tone-producing vibrations, that is, on the material and conditions of the vibratile body; *force* or *loudness*, depending on the relative amplitude of the vibrations, that is, on the energy of the force that causes them; and *timbre* or *quality*, depending on the relative complexity of the vibrations, that is, as with pitch, on the material and conditions of the vibratile body. A fourth characteristic, accidental rather than essential, is *duration*, depending on the relative continuance of the vibrations. Of these four characteristics, pitch and timbre merit special notice here. Tones produced by relatively slow vibrations are called grave or "low;" while those produced by relatively rapid vibrations are called acute or "high." The lowest tone used in orchestral music is given by about 16 vibrations per second; the highest by about 4000 vibrations per second. The standard vibration-number for a convenient tone of reference, called middle C, has varied considerably, but is now usually placed at 256 (the so-called "philosophical" pitch), at 261 (French), or at 264 (German). The difference in pitch between two tones is called an *interval*, and the acoustical representation of an interval is the ratio between their respective vibration-numbers. As a rule, the simpler the ratio, the closer is the relationship recognized by the ear between the tones. (For a further account of intervals and of their connection with the formation of scales, see paragraph III.)

Tones produced by different voices or instruments differ in timbre or quality. Speaking generally, every tone is compound, since vibratile bodies tend to vibrate both as wholes and in their aliquot parts, so as to produce a series of tones at once whose vibration-numbers are proportional to the series 1, 2, 3, 4, 5, 6, etc. These tones are called *partial-tones* or *partials*, or the first is called the *fundamental* and the others *overtones* or *harmonics*. The timbre of a tone depends on the number and relative loudness of its partial-tones. Furthermore, when two tones are sounded together, the character of the combination depends on the relative coincidence or divergence of their partial-tones, coincidence producing an effect called *consonance* and divergence producing *dissonance*. Another branch of acoustics which is of great musical importance is that of *resonance* or the sympathetic vibration induced by any sound in vibratile bodies which it strikes. This phenomenon is specially marked in cases where one or more of the partial-tones of the two bodies are coincident or nearly so. The modulations of the singing voice, and the construction and manipulation of all kinds of musical instruments, depend chiefly on applications of the laws of partial-tones and of resonance. (Further details are given in paragraph V. below.)

III. The science of musical construction or composition is the most highly developed branch of the entire subject. It is based on certain primary arrangements of musical materials and on certain rules of procedure which may be considered somewhat separately. (a) *Melody* is a general term for tones sounded in succession. Theoretically it rests on a use of certain intervals in the construction of *scales*. The interval between two tones of the same pitch is called a *unison* or *prime;* that between any tone and one whose vibration-number is twice as large, is called an *octave*. Two tones separated by an octave have such a relation that the ear accepts them as virtually repetitions of each other; hence they are sometimes called *replicates*. To make the infinite series of possible tones available for artistic use, it is therefore necessary only to agree upon some formula of selecting tones within an octave, since whatever is accepted within that limit may be readily transferred upward or downward one or more octaves. The typical octave may be made to begin at any tone whatever. The method of selecting tones within an octave, that is, of subdividing it into shorter portions, is called a *mode;* and the resultant series of tones, beginning from some assumed pitch, is a *key* or *scale*. Properly, therefore, a scale is the concrete result of using an abstract mode at a given pitch; but the terms are used indiscriminately. The mode or scale most in use at present may be expressed diagrammatically as follows:

MAJOR DIATONIC MODE OR SCALE.

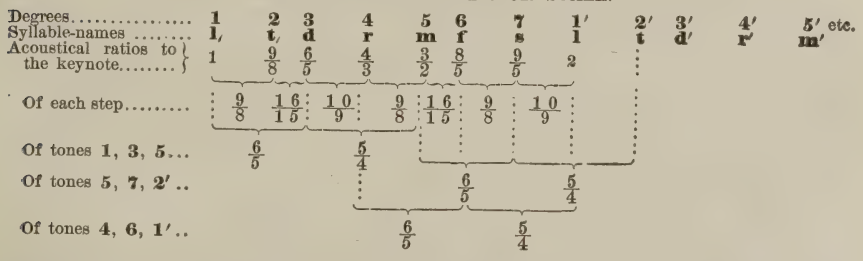


It will be noted that the above series includes the nearest acoustical relatives of the keynote up to a certain point, and that the tones **2** and **7** are then added on account of their relation to **5** and their convenient position for making an evenly graduated series. The successive steps are either *whole* ($\frac{9}{8}$ or $\frac{10}{9}$) or *half* ($\frac{16}{15}$), the latter occurring between tones **3** and **4** and between **7** and **1′**. The various tones fall into three groups,

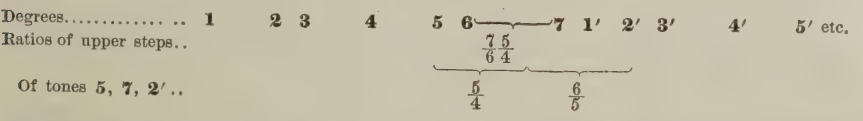
1–3–5, **5–7–2′**, and **4–6–1′**, which are exactly similar in construction. The syllable-names, of which the initial letters are given above, are *do*, *re*, *mi*, *fa*, *sol*, *la*, and *ti*, as established in the present system of solmization. (See paragraph IV.) The interval between any tone and the next is called a *second*, that between any tone and the next but one is called a *third*, etc. The several intervals between **1** of the above scale and the other tones are taken as standards in describing and naming all other intervals. Standard firsts, fourths, fifths, and octaves are also called *perfect*, and standard seconds, thirds, sixths, and sevenths are called *major*. A second, third, sixth, or seventh that is a half-step shorter than the standard, is called *minor* (thus the second **3–4**, the third **3–5**, the sixth **3–1′**, and the seventh **5–4′** are all minor). A fourth, fifth, or octave that is a half-step shorter than the standard, or a third or seventh that is a half-step shorter than a minor third or seventh, is called *diminished* (thus the fifth **7–4′** is diminished). Any interval that is a half-step longer than the standard is called *augmented* (thus the fourth **4–7** is augmented).

A second mode or scale recognized in modern music is as follows:

MINOR DIATONIC MODE OR SCALE.



The short steps occur here between tones **2** and **3** and between **5** and **6**. The three similar groups include the same tones as in the major mode, but the construction of the groups is different. This series is practically equivalent to a major series beginning on tone **6** and counting it **1**; hence the syllable-names given above. (To distinguish this from two other varieties of the minor mode, it is often called the *descending minor*.) Since in the minor mode the half-step **7–1′** has been found to have a unique harmonic importance, it is often retained in the minor, forming what is called the *instrumental minor*, as follows:



This gives an additional half-step, between **7** and **1′**, and an augmented second between **6** and **7**; and makes the group **5–7–2′** exactly like what is found in the major mode. It also gives a diminished fourth (**7–3′**), a diminished seventh (**7–6′**), and an augmented fifth (**3–7**). Still a third form of minor is in use, called the *ascending minor*, which differs from the major only in the position of the third tone, which is as in the other minors. It is therefore more like the major than the other minors, both in its successive steps and in its groups of tones.

In all the above modes the tone **1** is called the *keynote* or *tonic*, **5** the *dominant*, **4** the *subdominant*, **3** the *mediant*, **6** the *submediant*, **7** the *leading tone*, and **2** the *supertonic*; and the tones rank in general importance in about the order named. Each tone has a certain individuality and a peculiar melodic relation to the others. These individualities and relations taken together constitute the *tonality* or *keyship* of the scale, a complex phenomenon whose centre is the keynote. To compose a melody "in the key of" a given tone is to use only such tones as belong to the major or minor scale beginning on that tone, and as present with reference to it the relations of tonality.

In addition to the primary scale-degrees above described, certain other secondary degrees are to be mentioned, which arise either in the effort to make some other tone than **1** the keynote (see *modulation* below), or to subdivide each of the whole steps of one of the regular modes. Any tone a half-step above a given tone is called its *sharp* (marked ♯), while a tone a half-step below is called its *flat* (marked ♭). Thus, in the major mode intercalary or *chromatic tones* may be added thus:

$$1\ \ {}^{1\sharp}_{2\flat}\ 2\ \ {}^{2\sharp}_{3\flat}\ 3\ 4\ \ {}^{4\sharp}_{5\flat}\ 5\ \ {}^{5\sharp}_{6\flat}\ 6\ \ {}^{6\sharp}_{7\flat}\ 7\ 8$$

The pitch of these additional tones is not always determined in the same way, but in general the sharp of any tone is never theoretically exactly coincident with the flat of the tone above. On instruments with a keyboard, like the organ and the pianoforte, however, not only are these chromatic tones assumed to coincide, but every octave is

assumed to be divisible into twelve exactly equal half-steps, and the operation of tuning is performed accordingly, although slight discrepancies of pitch are ignored at every point. Such tuning is called *tempered* or "in equal temperament," in distinction from theoretical tuning, which is called *pure* or "in pure temperament." For instrumental purposes the equal temperament has conveniences that overbalance its inaccuracies.

Finally, mention should be made of the fact that the scales above described are not the only ones that appear in musical history. The scales of barbarous peoples are more or less capricious. Those of the Persians and the Hindoos include shorter steps than the half-step, and thus subdivide the octave into more than twelve portions. On the other hand, the Chinese, the Scotch, and some other nations, tend to avoid half-steps altogether, so that their scales comprise not more than five or six tones. The ancient Greeks were the first clearly to recognize the outlines of the modern scales, though their theories led to an objectionable tuning of certain tones, and to numerous experiments in so combining tetrachords that the half-steps should occur at several different places. Mediæval music perpetuated many of these ancient modes. It was not until the 16th century that the modern major mode, which previously had been cultivated mainly in the spontaneous songs and dances of the common people, and the modern minor mode in its three varieties, preserving most that was valuable in the ancient and mediæval modes, were generally accepted as artistic standards. Recent acoustical investigations have shown that this instinctive choice was founded on sound reason.

(b) *Harmony* is a general term for tones sounded simultaneously. Theoretically it rests on the use of consonances and dissonances in the construction of chords. A *consonance* is a simultaneous combination of two tones which is accepted by the ear as satisfactory and final in itself. A *dissonance* is such a combination which is inconclusive or unsatisfactory, requiring a consonance after it to complete and justify it. When the interval between the two tones is either a perfect first, fourth, fifth, or octave, or a major or minor third or sixth, the result is a consonance; in all other cases it is a dissonance. A *chord* is any simultaneous combination of three or more tones. The typical form of a chord is a *triad*, which is made up of any tone (called the *root* of the triad), with its third and its fifth. When the third is major and the fifth perfect, the triad is called *major*, and, as all its intervals are consonant, is consonant (as, in the major mode, the triads **1–3–5**, **5–7–2′**, **4–6–1′**). When the third is minor and the fifth perfect, the triad is *minor* and consonant (as **6–1′–3′**, **2–4–6**, **3–5–7**). When the third is minor and the fifth diminished, the triad is *diminished* and dissonant (as **7–2′–4′**). When the third is major and the fifth augmented, the triad is *augmented* and dissonant (as, in the instrumental minor mode, the triad **3–5–7**).

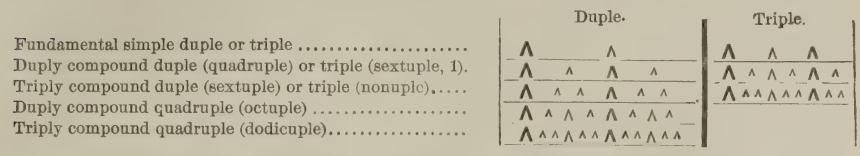
In practical composition the tones of a triad may be combined in any order and distributed over one or more octaves without destroying the character of the triad. When the root is below the other tones, the triad is said to be in its *first* or *original position;* when the third is below, it is in its *second position* or *first inversion;* and when the fifth is below, it is in its *third position* or *second inversion.* (Thus, the triad **4–6–1′** is in the first position when **4** is below the others, in the second when **6** is below, and in the third when **1** is below.)

Chords of four tones also occur. The most important variety is called a *seventh-chord* or *septchord*, and consists of a root, with its third, fifth, and seventh, as **5–7–2′–4′**. Such a chord is called major or minor, according as the seventh is major or minor. All septchords are dissonant, the major much more so than the minor. The most valuable septchord in both the major and the minor mode is that whose root is **5**, since it has a tendency to resolve itself into a triad of **1**. Septchords are susceptible of three inversions. Other more or less irregular chords of four tones occur in connection with the minor mode, which are called *chords of the added sixth*, but which need not be described here.

Tonality involves not only the melodic relations mentioned in the preceding section, but also the sum of the relations between the triads and other chords based on the tones of the scale. These relations cannot readily be described in words, but several features of them will be referred to later under the heads of part-writing, cadences, and modulation.

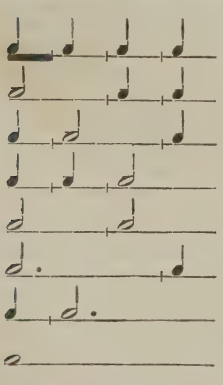
(c) *Rhythm* and *metre* are characteristics common to both music, versification, and dancing. The two terms are commonly used together and often indiscriminately; but they really refer to two distinct things. It would be well if *rhythm* could be confined to the succession of accents, beats, or pulses, equal in duration or interval of recurrence, but differing in weight or stress, which is the framework on which all music, verse, and dances are constructed. Two fundamental patterns of rhythm are used, the one called *duple*, and consisting of a heavy pulse or beat alternating with a light one **Λ** ∧ **Λ** ∧ **Λ** ∧; the other called *triple*, and consisting of a heavy pulse or beat alternating with two light ones, **Λ** ∧ ∧ **Λ** ∧ ∧ **Λ** ∧ ∧ . The heavy pulses are called *primary*, the others *secondary*. Throughout every piece of music one or the other of these patterns, or some derivative of them, is heard or felt continually, and

practically without variation (except for the sake of a kind of artistic license). Relatively the several pulses of a rhythm are equal; but their absolute length may vary indefinitely without essentially altering the rhythm. When the pulses are short, the *tempo* or *pace* is said to be quick or rapid; when they are long, it is said to be slow. Rhythms may be either *simple* or *compound*. Compound rhythms are derived from one or the other of the above by replacing each of the pulses by either a duple or a triple group of lesser pulses, which is constructed like the larger rhythm, one of whose pulses it exactly fills. The varieties of compound rhythms now most in use are as follows:



In the same piece the simple and the duply compound forms of the same rhythm are very frequently used in alternation, since they are readily convertible into each other. In elaborate music sporadic cases occur of the insertion of a comparatively foreign rhythmic group, as of one-half of a triply compound rhythm in the midst of a quadruple rhythm, and even of the simultaneous use of both duple and triple subordinate groups by different voice-parts. A triple group inserted where a duple is to be expected is called a *triplet* (compare *quadruplet, sextolet*, etc.).

If the term rhythm be used in the sense above described, *metre* should be confined to all the elements of relative duration as distinguished from those of relative stress or accent. While rhythm and metre are practically combined in closest union, theoretically they may be considered separately. The rhythms above described are made up of individual pulses of equal duration. These pulses are gathered into groups of equal duration, beginning with a primary accent, and including one or more secondary accents; these groups are called *measures*. Furthermore, the successive tones of a melody or chords of a harmony may have a variety of durational relations to each other, forming what may be called *metric patterns* to distinguish them from the rhythmical patterns mentioned above. If the melodic or harmonic units are equal in duration, the metric pattern is identical with the rhythmic. But a single tone or chord may be maintained for two or more pulses or for one or more of the various duple or triple subdivisions of a pulse, so that out of the same rhythmic pattern a variety of metric patterns may be constructed. In practical composition such varying metrical patterns form one of the chief elements of both variety and expressiveness. Thus, from a simple quadruple rhythm, even without attempting any subdivisions of the single pulses, the following metric patterns can be constructed within a single measure:



Furthermore, in this or other cases the place of one or more pulses may be occupied by silences or rests, thus giving still greater variety. Finally, the metrical group of tones or chords that belong together may begin and end in the middle of a measure. In practical composition the next larger metrical unit after that of the measure is a group of two measures, then a group of four measures, then one of eight, etc. Similar groups of measures into triplets also occur. Such groups of measures are then made to contain variously constructed series of tones or chords which are called *phrases, sentences, sections*, etc., each of which has a comparative unity of its own. The process of metrical integration is carried out with greater or less distinctness until an entire piece is made to consist of units of every degree from the single pulse up to the movement in its entirety. It should be added that the higher or larger metric units have more or less of a rhythmic unity as well, and that the aid of special accents may be sought to bring any tone or chord of melodic or harmonic importance into special prominence. In highly elaborated works the fundamental rhythmic pattern is often almost entirely lost to sight under the special and irregular accents that are necessitated to make the metric, melodic, or harmonic idea clear and impressive; though for purposes of analysis or study the rhythmic pattern is often brought out by some process of *beating* or *counting time*, as it is called.

(d) Out of the simple elements of composition thus far indicated, various complex elements are made up, which may be distinctly seen in almost all kinds of musical works. *Tonality*, as we have already noted, is one such complex element, resting chiefly on harmonic relations, though involving melodic elements as well. *Form* is another, depending principally on rhythmic and metric relations, but involving melodic and harmonic elements as well. The form of a piece is its abstract plan, whereby it has symmetry of parts, unity in diversity, and a systematic progress from

beginning to end; it is analogous to design or composition in the graphic arts, or to plan in architecture. Two particular factors which contribute much to both tonality and form are cadences and modulation. A *cadence* is a harmonic formula or series of connected chords which gives a conclusive effect to the end of a phrase or section. The completest kind of cadence is the *authentic*, which consists of a triad on **1** (the keynote), preceded by a triad or septchord on **5**. Only less complete is the *plagal* cadence, in which the penultimate chord is a triad on **4**. An *extended* or *compound* cadence consists of the three triads of **4**, **5**, and **1**, though one or two other varieties occur. A *half-cadence* is practically an authentic taken backward, that is, a triad on **1**, followed by one on **5**; it gives a temporary sense of conclusion, and occurs only at the end of some intermediate phrase, frequently at the half-way point of a section (whence its name). A *deceptive* cadence is one which ends in some other triad than that of **1**, when there is reason to expect the latter. *Modulation* is the act or process of moving the tonality of a piece from its original centre in the tone or triad of **1** to some other tone or triad. It is accomplished by replacing one of the tones of the original scale by some other tone, and thus altering not only the melodic steps of the scale but also the harmonic relations between all its tones. Thus, in the major mode, if **4**♯ be substituted for **4**, the previous **5** becomes a new **1** or keynote; if **7**♭ be substituted for **7**, the previous **4** becomes a new **1**; if **5**♯ be substituted for **5**, the previous **6** becomes a new **1**, and the mode changes to minor, etc. Such a harmonic diversion adds an indescribable extension to the resources of composition, since the comparatively easy modulations from any given tonality number from six to ten, or even more. The general principle of unity, of course, requires that a piece shall end in the tonality in which it began; hence every modulation involves a reversion or return, sooner or later, to the original key. Still another complex element of composition is *part-writing*. In all vocal music and in a large part of instrumental music also, a composition is conceived as made up of two or more (usually four) melodies or voice-parts proceeding simultaneously, each having a certain amount of individuality and independence, but all constructed on the same rhythmic pattern, and usually the same metric pattern, and combined to form a unified and continuous harmonic result. Part-writing of the strictest sort, in which each part is fully developed melodically, and the combination of all is most exactly regulated, is called *counterpoint* or *polyphony*, in distinction from *homophony*, in which only one or two parts are thus fully elaborated in conjunction with a more or less subordinated harmonic accompaniment. The rules governing formal counterpoint constitute a closely-wrought system, too technical for description here. Some of these rules, however, are accepted for all part-writing, such as the avoidance of parallel octaves or fifths between two parts, the retention in the same part of a tone common to two successive chords, the treatment of dissonances so that they shall not be introduced too abruptly or be left without full resolution into consonances, etc. The four parts used in ordinary plain composition are called *soprano* (or *treble*), *alto*, *tenor*, and *bass*. Relatively to each other, two parts are said to move in *similar motion*, if both progress up or both down at the same time, *parallel* if such motion extends over the same number of degrees, *contrary* if one progresses up and the other down, and *oblique* if one progresses up or down while the other remains stationary. The effectiveness of part-writing depends very largely, not only on the harmonies that occur between the parts, but on the skillfulness with which these varieties of motion are contrasted with each other in conspicuous parts.

(e) Musical production not only utilizes the simple or complex special elements thus far described, but also chooses between certain somewhat distinct general *forms* or *styles of composition*. Such general forms or styles depend partly on the instrument by which the composition is to be rendered, vocal music differing from instrumental, and instrumental music varying widely according to the nature of the particular instrument. Characteristic *vocal forms* are the ballad, the song, the recitative, the aria, the scena, the madrigal, the glee, the part-song, the round, the chorale, the motette, the anthem, the cantata, the mass, the opera, and the oratorio. Characteristic *instrumental forms* are the manifold dances, such as the waltz, the mazurka, the minuet, and many more (though many of these were originally vocal forms), the various kinds of marches, the romanza, the sonata, the overture, the concerto, and the symphony. Certain forms are both vocal and instrumental, such as the duet, trio, and quartette, the canon, the fugue, etc.; and most vocal music involves instrumental accompaniment of greater or less elaboration. Any detailed description of the distinguishing features of these several forms is obviously impossible here. Furthermore, all musical composition, vocal or instrumental, falls into more general classes or styles, such as *chamber music*, intended for use in domestic life or in semi-private gatherings of people, *concert music*, intended for public use on a large scale, often in combination with theatrical accessories, and *church music*, intended for use as a part of religious worship; or such as *popular* or *folk music*, which springs up more or less unconsciously among the common people, and *artistic music*, which is produced deliberately in accordance with the rules and usages of professional musicians; or such as *lyric music*, intended primarily for the utterance of subjective emotions or fancy; *epic music*, intended to portray trains of feeling, situations, characters; and *dramatic music*, intended powerfully to affect and rouse the hearer. In all these aspects musical utterance and creation present numerous

close analogies with utterance and creation in the other fine arts, especially those of speech, with which music is indeed often actually united in song. Finally, the historical stages in the development of the art of composition are often indicated by the use of such adjectives as *Gregorian*, *classical*, *romantic*, *Wagnerian*, and many others.

IV. The representation of musical thoughts and facts by written signs has proceeded on two or three different theories. For example, successive tones in an accepted series have been represented by the successive letters of the alphabet, as by the ancient Greeks and Romans. This system, after making allowance for the way in which the interval of the octave may be used to divide a series of tones into equal and similar parts, is perpetuated to the present day, seven tones being assigned to an octave, and these being known by the letters A, B, C, D, E, F, and G. For reasons whose history need not be explained here, these letters are typically applied to the tones of a minor rather than a major scale, thus :

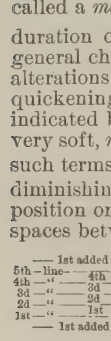
	A	B	C	D	E	F	G	A′	B′	C′
(minor)	1	2	3	4	5	6	7	1′	2′	3′
(major)			1	2	3	4	5	6	7	1′

so that the tones of a major scale are represented by a series beginning with C. Furthermore, an approximately fixed and absolute pitch, is indicated by these letters. It is now customary to reckon all tones from what is called *middle C*, whose absolute pitch is between 250 and 275 vibrations per second (see paragraph II. above). By the use of these letters, in combination with the acoustical relations given in paragraph III., it is possible to indicate with considerable precision any conceivable tone.

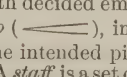
Another system of notation is that of *solmization*, which applies arbitrary syllables not to tones of absolute pitch, but to the relative degrees of a hexachord or octave-scale. The syllables now most in use are attributed to Guido d'Arezzo, and are derived from the initial syllables of a mediæval hymn to St. John, with some later modifications. They are *do* (or *ut*), *re*, *mi*, *fa*, *sol*, *la*, *si*. These are properly applied to the successive tones of a major scale, irrespective of their absolute pitch, **1** being always *do* ; **2**, *re*, etc. The Tonic Sol-Fa notation abbreviates these syllables to their initial letters, and to avoid ambiguity, inserts *ti* in place of *si*. The sharp of *do* is called *di*, the sharp of *re ri*, of *fa fi*, of *sol si*, of *la li* ; while the flat of *si* is called *se*, of *ti te*, of *la le*, of *sol se*, of *mi me*, of *re re*. The minor scale is solmizated in two different ways, according as the keynote is called *do* or *la*. (In addition to the above use of solmization, mention should be made of another system, called that of "the fixed *do*," in which the tone whose letter-name is C is called *do*, irrespective of its scale-relations, D *re*, E *mi*, etc. This system is therefore only an extension of the alphabetic system, without any of the advantages of true solmization.)

The most extensively used system of notation is that of notes and the staff. *Notes* are characters of such shapes as , , , the oval portion of which, whether open or solid, white or black, is called the *head*, the vertical line the *stem* or *tail*, and the oblique strokes, if any, *pennants* or *flags*. Each such character represents a tone. The shape of the note indicates the desired duration or length of the tone relative to other tones in the same piece. The varieties of note now in use are the breve or double note, , the semibreve or whole note, , the minim or half-note, , the crotchet or quarter-note, , the quaver or eighth-note, (or in groups,). the semiquaver or sixteenth-note, , the demisemiquaver or thirty-second-note, , and the hemidemisemiquaver or sixty-fourth-note, . None of these notes has any absolute time-value except as they are used in a particular piece ; but within a given piece each variety is equivalent to two of the next variety. The time-value of a note may be increased one-half by a *dot* placed after it, as (= +), or indefinitely at the performer's discretion by a *pause* or *hold*, or , placed over or under it. Its time-value may be decreased by a *staccato-mark*, a dot or stroke placed over or under it, thus, or , which indicates that a part of the note's normal duration is to be given to a silence or rest. The time-value of two notes may be added together by a *tie* or *bind*, or , between them, as or , in which case the second is simply added to the first without repetition. *Rests* are characters to indicate silences of similar time-values to those of notes. The following rests are in use : The breve rest, , the semibreve, , the minim, , the crotchet, , the quaver, , the semiquaver,

the demisemiquaver, , and the hemidemisemiquaver, . The time-value of rests may be increased by a dot or a hold, as in the case of notes. The *tempo* or absolute duration of notes in a given piece is indicated at the beginning either by such general terms as *allegro*, quickly, *andante*, flowingly, *moderato*, moderately, *largo* or *adagio*, slowly, or by reference to a mechanism for marking exact subdivisions of a minute, called a *metronome*, as (indicating that in the given piece a is to have the duration of $\frac{1}{96}$ of a minute). In many cases the intended tempo is indicated by the general character of the piece, or is left to the artistic sense of the performer. Gradual alterations of tempo are indicated by such terms as *accelerando*, *stringendo*, etc., for quickening, and by *ritardando*, *calando*, etc., for holding back. Force or loudness is indicated by such terms as *forte*, loud, *fortissimo*, very loud, *piano*, soft, *pianissimo*, very soft, *marcato*, with decided emphasis, etc. Gradual changes of force are marked by such terms as *crescendo* ( ), increasing, *diminuendo*, *decrescendo*, *morendo*, ( ), diminishing, etc. The intended pitch of the tones indicated by notes is shown by their position on a staff. A *staff* is a set of five horizontal lines, both the lines of which and the spaces between them are called *degrees*, which are numbered from below upward, thus :

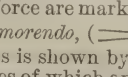


When more room is required, a staff may be extended upward or downward by *added* or *leger lines* and *spaces*. The successive degrees of a staff are assumed to correspond to successive degrees of the scale, no matter what degree is assumed as a starting-point. Thus, if 1 be placed on the lower line, the significance of the staff will be as follows :



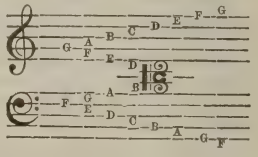
For vocal music, know what degree be able to infer the

or if on the second space thus,



etc. therefore, it is only necessary to of the staff is assigned to 1 to entire significance of the staff.

But the absolute pitches to which the staff-degrees are assigned are also indicated by other characters. A *clef* is a mark indicating the absolute pitch of some one degree. Thus, the G-*clef* (treble or violin clef) , marks the degree encircled by its main portion (usually the second line), as assigned to the G next above middle C ; the F-*clef* (bass clef), , marks the degree on which its head stands (usually the fourth line) as assigned to the F next below middle C : while the C-*clef*, marks the degree embraced by its central portion as assigned to middle C (this last clef is more variously used than the others, and is known by or different names, according to the degree on which it is placed.) The relation of the clefs to each other (as now commonly used), and the method in which the successive degrees are lettered up and down from them is indicated by the figure.

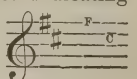


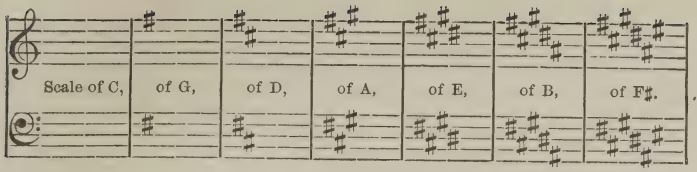
Referring back to the explanation of the construction of the scale and to the absolute tones which are indicated by the letters, it will be seen that only when C is taken as the keynote will the series of tones indicated by the letters exactly correspond to the major scale. If other starting-points are chosen, one or more intercalary tones are required to make the series correct. It is customary to name such tones either the sharp of the letter below or the flat of that above ; and the choice between the two possible names is governed by the rule that in the same scale the same letter must not be used twice. Thus, if a scale be begun on D, it will read D, E, F♯, G, A, B, C♯, D (not G♭ or D♭). Using these principles, it is found that the following system of scales is derivable from the letter system of naming tones :

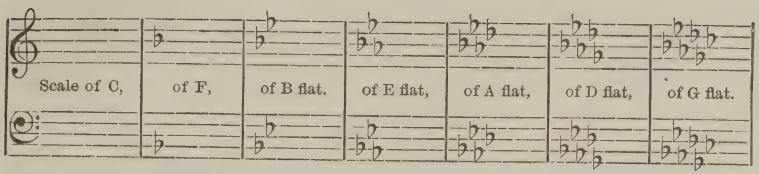
C	D	E	F	G	A	B	C
G	A	B	C	D	E	F♯	G
D	E	F♯	G	A	B	C♯	D
A	B	C♯	D	E	F♯	G♯	A
E	F♯	G♯	A	B	C♯	D♯	E
B	C♯	D♯	E	F♯	G♯	A♯	B
F♯	G♯	A♯	B	C♯	D♯	E♯	F♯

F	G	A	B♭	C	D	E	F
B♭	C	D	E♭	F	G	A	B♭
E♭	F	G	A♭	B♭	C	D	E♭
A♭	B♭	C	D♭	E♭	F	G	A♭
D♭	E♭	F	G♭	A♭	B♭	C	D♭
G♭	A♭	B♭	C♭	D♭	E♭	F	G♭

Inasmuch as the degrees of the staff signify, when taken by themselves, only the tones indicated by the letters, a special sign is needed to indicate any one of the intercalary tones thus required. For this purpose the signs ♯ and ♭, called a sharp and a flat respectively, are used. When the tone D, for instance, is taken as the keynote, the significance of the staff must be so changed as to fit it to receive notes indicating the tones F♯ and C♯ instead of F and C. This is accomplished by placing sharps on the degrees usually assigned to F and C, thus : This group of sharps is called the *key-signature*. The several key-signatures required to indicate the various scales given in the above table are as follows :







When a note is placed on a staff, the position of the note-head indicates the tone intended, the significance of the degrees being derived from the clef and the key-signature together. Thus:  indicates the tones A, F♯, E, C♯, B, G♯.

It only remains to add that if an intercalary tone is required which does not belong to the original scale, the significance of one of the staff-degrees is temporarily altered by the insertion in the body of the music of an *accidental*, which may be either a sharp, a flat, or, if the power of a previous sharp or flat is to be suspended, a natural or cancel, ♮. The power of an accidental is understood to extend only through the measure in which it occurs, or until it is nullified by another accidental on the same degree.

The notation of rhythm and metre commonly consists of vertical lines, called *bars*, drawn across the staff to mark the place where primary accents fall and to divide the notes into metrically equal portions called *measures*, thus: bar measure bar measure bar  The rhythm to be used in a particular piece is indicated at the beginning by the *rhythmic signature*, which consists of two figures, of which the upper indicates the number of pulses or beats within each measure, while the lower indicates the variety of note assumed as a unit of each pulse. The usage regarding rhythmic signatures is not entirely consistent or satisfactory, since the same signature may indicate somewhat different rhythms. The usual marks are these:

Simple duple, $\frac{2}{1}$, $\frac{2}{2}$, $\frac{2}{4}$, or even $\frac{4}{4}$ (also).
Simple triple, $\frac{3}{1}$, $\frac{3}{2}$, $\frac{3}{4}$, $\frac{3}{8}$.
Duply compound duple (quadruple), $\frac{4}{1}$, $\frac{4}{2}$, $\frac{4}{4}$ (also).
Duply compound triple (sextuple, 1), $\frac{3}{2}$, $\frac{3}{4}$.
Triply compound duple (sextuple, 2), $\frac{6}{4}$, $\frac{6}{8}$.
Triply compound triple (nonuple), $\frac{9}{4}$, $\frac{9}{8}$.
Duply compound quadruple (octuple) $\frac{4}{4}$ (also).
Triply compound quadruple (dodecuple), $\frac{12}{4}$, $\frac{12}{8}$.

Various other signs are used, such as a *brace*, to connect together two or more staffs that are to be used simultaneously; the double bar, to mark the end of a piece or of a principal section; a repeat, to indicate a point at which the performer is to turn back to some previous point and repeat what has already been performed (that point being marked either by the sign, or by the terms *da capo* or D.C., "from the beginning" [of the piece], or *dal segno* or D.S., "from the sign" [𝄋]); a *slur*, which is a curve connecting two or more notes on different degrees which are to be sung to a single syllable of the words, etc.

In addition to the above arbitrary signs, a great variety of verbal directions, usually in Italian, are used to indicate general style of performance; and, furthermore, each particular instrument has its own special list of technical signs and terms.

The Tonic Sol-Fa notation has also several signs for the above purposes which are different from those of the staff-notation; but most signs are common to both notations.

Thorough-bass is a system of short-hand indications of the constitution of chords, of which no description need be made here.

In early mediæval music, notation was by means of various arbitrary signs called *neumes* (from which the modern staff-notation has been gradually developed), and somewhat later by various conventional systems of marks or letters called *tabulatures*, all of which are now obsolete.

V. The subject of musical performance, as distinguished from composition and notation, includes (a) the general relations of a performer to the thought of the composer as it is conveyed by means of signs; (b) the construction and classification of musical instruments (including the voice) as appliances for performance; and (c) the practical manipulation of such instruments or *technique*. Under (a) should be considered especially the art of *phrasing*, that is, of rendering particular notes with a due sense of their relations to notes before and after them, so that each musical thought shall be presented in its entirety and proportion, and with a nice observance of dynamic and other gradations and contrasts. Still higher than this is the art of *expression*, that is, of discovering in the notes the sentiment or emotional content of the phrases and of setting this forth with sympathy and effectiveness. A difficult problem at every point is that of the performer's individuality in relation to that of the composer—whether the ideal of the performer should be to present only that which he conceives to be the composer's intention, or whether the ideal is that intention plus a more or less independent intention or conception on the performer's part. The solution of this problem in a given case obviously depends on the capacity and genius of the performer.

Under (b) several different classifications are possible, depending on whether the attention is fixed on one or another factor in the construction of the instrument. For example, if we look at the force by which the tone is produced, instruments are either *inflatile*, blown by the breath or a stream of air, as the voice, a flageolet, a horn, or an organ; *percussive* or *pulsatile*, sounded by means of a blow, as cymbals, a dulcimer, a pianoforte, or a drum; *plucked* or *twanged*, as a guitar, a harp, or a harpsichord; *fricative*, rubbed, usually by means of a bow, as a violin or any of its numerous relatives. If we look at the body whose vibration constitutes the tone, we see that instruments are either *pneumatic*, having a confined body of air that may be set into vibration, as a flute or the flue-stops of a pipe-organ; *stringed*, having usually a graduated series of stretched cords of gut or metal, which may be plucked, rubbed, or struck, as a lute, a viol, a harp, or a pianoforte; *tongued* or *reed*, having a wooden or metallic reed or tongue which may be thrown into vibration in connection with a tube, as a clarinet, a bassoon, the reed-stops of a pipe-organ or the vibrators of a reed-organ, together with most of the metal wind-instruments, like the trumpet, the horn, etc., as well as the voice itself, in all of which the vibrating reed is the tissue either of the lips or of the larynx; *tympanic*, having a vibrating membrane or head, as a drum or a tambourine; *vibrating entire*, as a bell or a tuning-fork. If we look at the means for fixing the desired pitch of the tones, we see that instruments are either *of fixed intonation*, having a series of vibratile bodies, or a series of adjustments so as to produce only certain comparatively invariable sets of tones, as a lyre, a harp, a pianoforte, an oboe, a cornet, or a trombone; *harmonic*, capable of giving any one of a harmonic series of tones according to the method of blowing, as a horn or a true trumpet; *of free intonation*, having vibratile bodies whose length or tension can be so varied as to yield variable tones, as the voice, or any member of the viol family. If we look finally at the capacity of instruments for the performance of more than one voice-part at once, we see that they are either *solo, melodic, monophonic*, as the voice, a flute, a horn, or (usually) a violin; or *concerted, harmonic, polyphonic*, as a pianoforte, an organ, a harp, or a zither. The modern *orchestra* is customarily regarded as composed of the following groups of instruments: *the strings*, including violins, violas, violoncellos, bass viols; *the wood wind*, including flutes, oboes, clarinets, English horns, bassoons; *the brass wind*, including French horns, trumpets, cornets, trombones; and *the percussives*, including tympani, drums, triangles, and also harps and the pianoforte. It is obviously out of the question to enter into any detailed description of any of these instruments, as regards their capacity for the reproduction of music; but the mere enumeration of the above classes, with a citation of a few examples, sufficiently indicates the extent of this part of musical science.

Under (c) it is equally evident that no discussion in detail is possible here of the multitudinous elements of *technique* as found in the manipulation of the above instruments. The mastery of any one of the leading instruments involves not only the development of a high grade of muscular power and dexterity in the performer's throat or fingers or lips, as the case may be, but also an intricate and difficult correlation between the will, the mind, and the body, as well as such long practice and experience as shall make the mechanical effort of performance as nearly unconscious and automatic as possible. The temptation is strong to become so absorbed in the mechanical process, that its strictly subordinate importance, in comparison with the intellectual and æsthetic processes of which it is the minister, shall be forgotten. So far as this inversion of interest occurs, music is properly only a branch of gymnastics or athletics, instead of a true fine art.

Furthermore, it should be remarked that interest in the study and mastery of mechanical instruments has drawn away attention too much from the typical importance of *the singing voice* as the greatest and most vitally expressive of all means of musical performance. It has been well demonstrated that musical progress that is dissociated from a thorough cultivation of singing is abnormal and liable to the gravest mistakes. Nothing is more hostile to the establishment of music in its noblest rela-

tions to civilization than an exclusive attention to the manipulation of instruments, particularly those that present a small amount of affinity to the voice.

VI. The apprehension, appreciation, and criticism of music from the standpoint of the auditor is a branch of the general subject that does not admit of satisfactory treatment in the limits of such an article as this. The mere physiological side of the matter is obscure, since the mechanism and action of the sense of hearing are still in dispute. The problems of what constitutes tonal beauty, and of how the various artistic dispositions of tones arouse and suggest trains of thought and feeling in the mind of the hearer, are not more plain than the analogous problems connected with the æsthetics of painting or architecture or poetry. The criticism of musical forms and of particular musical works, as they appear to the auditor, involves not only a considerable knowledge of the entire field of musical composition and performance, but certain recondite questions of the subjective side of perception in general and of intercommunication between different persons in particular. It is clear that the nature of this part of the subject can only be suggested here in the most cursory manner. Yet this topic possesses a decided fascination to any one who realizes the universality of the popular interest in music and of the popular susceptibility to the influence of musical impression. That music possesses a wonderful and practically unique power is generally admitted; though the reasons and the analysis of that power are matters of at present irreconcilable controversy.

VII. The application of music in connection with certain general departments of practical life is a subject that merits more attention than it has as yet received. To the artist himself, so long as he is immersed in the technical work of his art, art seems to be a complete and satisfactory end in itself. But to the student of sociology in its broadest sense every art must be considered in its relations to the life of society as a whole and of each individual member of it. The fact that music is of all the arts the one most remarkably developed at the present stage in the world's civilization, as well as one that has always shown itself to be marvelously potent to determine the moods and the actions of those who yield to its influence, is sufficient to justify careful consideration from any one who is interested in education, social life, and religion. Of the manifold conceivable practical applications of music, two or three have already secured more or less notice. For instance, the use of music as a branch of juvenile education is to be most strongly urged, not only because it involves a healthful exercise and growth of the lungs and the throat, but because it stimulates both intellectual and emotional development, in some important respects furnishing a discipline that cannot easily be matched by any other study whatever. It can be shown that the plea for the regular and continuous instruction in vocal music throughout all the grades of the common-school system rests upon the most cogent reason; and, if so, that the ideals and methods of such instruction form an important branch of general pedagogics. In the same way there is room for a fuller study than has yet been made of the ideal function of music as a factor in social life. Music, like other fine arts, has suffered in popular estimation and in its best influence by the fact that it is so generally used simply as a minister of idle, sensuous gratification, without any systematic attempt to measure or direct its power as the language and the educer of the highest emotion. As the science of sociology advances, it should make a larger place for the discussion of the practical applications of all the fine arts, and especially of music as the most elaborate and progressive of these arts. No one of the specific applications of music has been historically more important than that to the public services of religion. The very unfolding of the art of music has been largely due to the practical requirements of such services Many of the grandest creations of musical genius have been dictated by the impulse to religious utterance, either for expressive or for impressive purposes. It may even be argued that to a remarkable degree the subtle and intense sentiments of religion demand a special language in addition to speech, such as music has proved itself to be. Accordingly, it follows that church music should be more generally accepted than it has been as a prominent branch of practical liturgics or the science of public worship. Other phases of the application of music to ends outside itself might be mentioned; but enough has been suggested for the present purpose, since this section of musical science, like some others, is only tentatively developed in current thought.

History. The historic development of music naturally divides into three chief stages: (1) *the barbarous stage*, in which music is used unreflectively as an accessory of savage life; (2) *the transitional stage*, in which it is subjected to analysis, criticism, and experiment with a view to deliberate artistic effort, the command of the rudiments of composition and of the implements of performance, however, being still manifestly imperfect, and (3) *the artistic stage*, in which both the science and the technique of the art are sufficiently advanced to encourage its free use as one of the expressions of cultured civilization. Examples of all these stages may be found at once at the present time and at various epochs of history. Viewed as a whole, however, music has slowly advanced from one stage to another. As compared with the arts of architecture, sculpture, painting, or poetry, music has been peculiarly slow in attaining its maturity, since the opening of its era of free development cannot be set earlier than the sixteenth century. In a general way the age of modern music in its full glory may even be limited to the eighteenth and nineteenth centuries.

The unconscious efforts of barbarous music everywhere show a remarkable similarity.

A predilection is universal among men for rhythmical noises, like the beating of drums, for rhythmical movements, that is, dances, and for rhythmical speech, which is versification in embryo. The sensuous effects of intense or of sustained tones, both of the voice and of such instruments as barbarous ingenuity can devise, are also generally sought. The grouping of different tones into melodic series, either in the inflections of language or in a kind of monotonous cantillation, is widely common. In many cases an instinctive preference is manifested for successions of tones having somewhat precise relations to each other, or in other words, for tones that belong to true scales. The use of tones in simultaneous union with each other, so as to form harmonious concord, is almost unknown in barbarous music.

The most important initial steps in the transitional stage of musical history were taken by the ancient Hebrews and Greeks, though all the nations of the Orient contributed something. It is not impossible that some of the usages of the music of the Hebrew Temple worship, as first organized by David in the eleventh century B.C., may have influenced musical progress in Christian times. Certain it is that the investigations of the Greeks into the construction of scales, into verse and dance-forms, and into the amalgamation of music with poetry for dramatic purposes, more or less dominated musical thought and practice until the very beginning of the modern period. The earliest developments of music under the influence of Christianity were confessedly only extensions of Greek theories. The reforms and systemizations of Ambrose of Milan in the fourth century and of Gregory the Great in the sixth, simply established and gave general currency to selected parts of the bewildering mass of speculations by Pythagoras, Aristotle, Aristoxenos, Euclid, and their numerous followers. The most important services of the Middle Ages to music consisted in the gradual selection from these speculations of that which was melodically simple and necessary, in the gradual invention of a harmonic theory and praxis entirely unknown to the ancients, in the establishment of a clear and elastic system of notation, and in the slow perfecting of the principal instruments of musical performance. Most of these processes went on under the explicit encouragement of the Church, but it is probable that in all these directions the final results were profoundly influenced by the reaction of popular, secular, or folk-music, since it seems certain that many of the characteristics of modern musical theory were first employed unconsciously in non-scholastic surroundings. Among the earliest mediæval musicians Hucbald (d. 930), Guido d'Arezzo (d. 1050), and Franco of Cologne (d. about 1220) are conspicuous. The centre of musical culture remained in Italy until the eleventh century, then moved to France for between two and three hundred years (1100–1350), and thence passed to the Low Countries, which furnished throughout the fourteenth, fifteenth, and sixteenth centuries almost the entire supply of educated musicians to the whole of Europe. The French and Netherland schools accomplished during this period the thorough conquest of the art of counterpoint, that is, of the simultaneous combination of two or more melodies together, including the recognition of the true relation of dissonance to consonance, of rhythmical and harmonious part writing, of imitation, with all its varieties and extensions. The greatest masters of these schools were Dufay (d. 1432), Okeghem (d. 1512), Josquin des Prés (d. 1521), Willaert (d. 1563), and Orlando di Lasso (d. 1594), the last two of whom are noteworthy particularly because they carried their art into Italy and Germany respectively and became the centres of new developments there. During this period remarkable progress was made in the art of singing. Indeed, the art of composition as then known was the direct outcome of a thorough cultivation of vocal technique. The typical musical instruments were also prepared for artistic application, such as the organ, the violin, the oboe, and the trumpet. The modern musical notation, beginning from the early neumes, and advancing through the intricacies of the mediæval mensural—music, had by this time reached a sufficient completeness for the recording of elaborate composition. The printing of music from movable types began in Venice in 1501.

The sixteenth century wrought a wonderful revolution in music. In its earlier decades the Lutheran Reformation introduced a new use of harmony, in distinction from counterpoint, in the form of the chorale. A similar change went forward about the same time in northern Italy under the influence of Willaert. Toward the end of the century, an attempt on the part of certain Italian dilettanti to revive the ancient musical declamation led with wonderful rapidity to the establishment in 1600 of two new art-forms, the opera and the oratorio, together with the emancipation of instrumental music from mere subservience to vocal. The expanding thought and feeling of the age found in music a language, already highly developed in technical detail, which was capable of unlimited extension and variety. In the seventeenth century music suddenly advanced to a position of great prominence throughout Europe. In Italy dramatic music, either in the form of the opera or in that of the oratorio, was cultivated with great enthusiasm under the lead of Monteverde (d. 1643), Carissimi (d. 1674), Cavalli (d. 1676), A. Scarlatti (d. 1725), and others, while instrumental virtuosi also flourished, such as the organist, Frescobaldi (d. about 1641), the violinist, Corelli (d. 1713), and the harpsichordist, D. Scarlatti (d. 1757). German music was principally concerned in this century in amalgamating the tendencies of the contrapuntal period with the spirit and music of the Reformation, though the works of Schütz (d. 1672) show the influence of the revolutions going on in Italy. French opera was a direct offshoot from Italian, its foundation dating from the

works of Lully (d. 1687). English music meanwhile had a development more or less independent, which appears to have been based on a contrapuntal preparation of which little is yet known, and which devoted its energies principally to church music and to madrigals under such leaders as Tallis (d. 1585), Gibbons (d. 1625), and especially Purcell (d. 1695), who evinced very remarkable original gifts in the composition of opera. The eighteenth century is distinguished from its predecessor not only by the consolidation into final shape of the fugue, the opera, the oratorio, the suite, the sonata, the symphony, and the production of many works of lasting value, but in the breaking down of the distinctions between nationalities in the matter of music, so that the great masters became the leaders of musical thought everywhere. In Italy, as followers of the tendencies of the preceding century, Pergolesi (d. 1736), Lotti (d. 1740), and Leo (d. 1746), may be mentioned, together with Keiser (d. 1739) and Fux (d. 1741) in Germany and Rameau (d. 1764) in France. An epoch was made by the genius of J. S. Bach (d. 1750), the most famous of a series of German composers of that name, whose works, both for the organ and for the voice, form the consummation of the contrapuntal idea under the disciplined guidance of a truly modern spirit. Bach's life was quiet and uneventful, and his true importance was not recognized until the present century. Contemporaneous with him was Händel (d. 1759), born in Germany, educated partly there, partly in Italy, and finally settled in England, whose power was especially displayed first in opera and later in oratorio so as to gather up into emphatic popular effectiveness the detached studies of the preceding century, and transmit them for the inspiration of later generations. A little later appeared Gluck (d. 1787), an Austrian by birth, an Italian by training, but whose labors as a reformer of the arbitrary methods of the opera were divided between Vienna and Paris. Another epoch-making master was Haydn (d. 1809), also of Austrian birth, but known and beloved throughout Europe, who brought orchestral music into special prominence by combining the characteristics of the old suite (of dances) with the new sonata-form in the form of the symphony. Much younger than Haydn was Mozart (d. 1791) whose inborn gifts were of a much more brilliant order, so that he not only outstripped Haydn in symphonic composition, but decidedly advanced the development of the opera, particularly on the side of lyrical melody. The culmination of the "classical" period, as the last half of the eighteenth century is called, was Beethoven (d. 1827), who transmuted the formal perfection of his time into a new glory by filling it with an emotional content of such breadth, variety, and beauty that his symphonies, sonatas, and certain vocal works still remain unsurpassed in grandeur and pathos. The most convenient of modern instruments and one of the most expressive—the pianoforte—first attained prominence during the last years of the eighteenth century, supplanting the harpsichord and clavichord. Beethoven's latest style directly led to the appearance of the "romantic" school, in which imagination and the utterance of subjective feeling took decided precedence of structural or objective elegance. Weber (d. 1826) was the initiator of this new movement, which bore early and charming fruit in the songs and symphonies of Schubert (d. 1828), and more remarkably still in those of Schumann (d. 1856), and of Spohr (d. 1859); while they were combined with the results of the preceding period by Cherubini (d. 1842), and more especially by Mendelssohn (d. 1847), one of the noblest and most balanced of composers, especially of oratorio. Grand opera reached a special prominence in the hands of Spontini (d. 1851), Meyerbeer (d. 1864), Rossini (d. 1868), Auber (d. 1871), Verdi and Gounod. The entire field of dramatic music received a new stimulus and enlargement from the radical theories and gigantic works of Wagner (d. 1883), the most important single composer since Beethoven. Orchestral resources were decidedly enriched by the contributions of Berlioz (d. 1869). Other important names of the present period are Raff (d. 1882), Gade (d. 1891), Brahms, Dvorak, Rubinstein, etc. The tendency of the present century has been very strongly to emphasize instrumental as compared with vocal music, and especially to magnify dramatic and orchestral effects.

American music has had little independent value or growth until within the last quarter century. During that period not only has a remarkable development of taste and interest taken place, but a large number of able composers have appeared whose works bid fair to place America in the twentieth century at least within the limits of comparison with England and Germany, which are now the musical leaders of the world.

MUSIC IN THE UNITED STATES. The history of music in the United States had its origin in the psalm-singing of the Puritans, and until 1825, when Italian opera was first given in this country, church music was cultivated to the exclusion of all other styles. It appears that Ainsworth's version of the Psalms was brought over by the Pilgrim Fathers who landed on Plymouth rock; and remained in use till 1693, when the *Bay Psalm-Book* was generally adopted. This latter version was printed in 1640 in Cambridge, Mass., with the title *The New England Version of the Bay Psalm-Book*, and was the first important publication of its kind in America. Although it had been compiled by an association of New England ministers, and approved by the churches, it met with great opposition, as many congregations looked upon the old version as a legacy intrusted to them by their forefathers. Among other scruples of conscience were, whether the singing of the Psalms of David with a lively voice was proper in these New Testament days. This and other quibbles set the churches into a turmoil, which did not subside until the Rev. John

Cotton wrote a tract in answer to the objections, which was sent to all the churches. Nathaniel D. Gould states in his book on *Church Music in America* that "when this tract or circular was read, and their feelings were reconciled, other objections and queries arose, namely, whether it was proper for one to sing, and all the rest to join only in spirit, and saying amen, or for the whole congregation to sing. Whether women as well as men, or men alone, should sing; whether pagans (the unconverted), be permitted to sing with us, or church-members alone. Also, whether it be lawful to sing psalms in meter devised by man, and whether it be lawful to read the psalm to be sung, and whether proper to learn new tunes which were uninspired; for it appears that they had so long been accustomed to hear and sing the same few tunes that they had imbibed the idea that the tunes were inspired, and that *man's* melody was only a vain show of art." Previous to the year 1690 there were but eight or ten psalm-tunes, taken mostly from Ravenscroft's collection, and they were sung in rotation, without any regard to the subject of the preacher. About 1712 Rev. John Tufts of Newbury published a book of twenty-eight tunes, with rules "that the tunes might be learned with the greatest ease and speed imaginable." When it was made known that some had acquired the art of learning a tune by note, without having heard it sung, "all were amazed, and still more astonished that all could finish a tune together." Rev. Thomas Walter of Roxbury, Mass., in 1721, edited the first book of music (except the few tunes attached to the *Bay Psalm-Book*), with the art of singing by note, with bars to divide the notes or measures, for the first time. The Rev. Mr. Barnard of Marblehead published the psalms and hymns in verse, with fifty tunes at the end of the book. His work contained such tunes as Mear, Windsor, etc., in three parts, with one page of instructions. James Lyon of Philadelphia, in 1761, published a choice collection of psalm-tunes, hymns, and anthems, in two, three, and four parts, called *Urania*. Josiah Flagg of Boston, in 1764, published a collection of church-music, engraved by Paul Revere, containing 116 tunes, generally of rather a light character. In 1770, appeared in Boston, *The New England Psalm-Singer, or American Chorister, containing a number of psalm-tunes, anthems, and canons, composed by William Billings, a native of New England.* This book opened a new era in American church music. William Billings was the author of six books of music, which were nearly all original, and very popular in their day. He was a zealous patriot, and the words to which he set many tunes combined religion and patriotism. These melodies were sung in the tent by the soldiers as well as in the church, and did much toward exciting the spirit of liberty among the people. Among those who succeeded Billings in compiling and composing church-music were Andrew Law, Oliver Holden, Samuel Holyoke, Daniel Reed, William Little, Timothy Swan, George Lucas, Thomas Hastings, Lowell Mason, George James Webb, N. Gould, Henry E. Moore, William B. Bradbury, E. Ives, B. F. Baker, H. W. Greatorex, George Kingsley, L. O. Emerson, Charles Zeuner, H. K. Oliver, John Zundel, Albert W. Berg, Henry Stephen Cutler, William H. Walter, Henry Wilson, William A. King, D. F. Hodges, Richard Storrs Willis, S. P. Tuckerman, H. N. Johnson, H. C. Timm, A. F. Lejial, L. H. Southard, J. H. Wilcox, Joseph Mosenthal, John P. Morgan, A. Kreisemann, Dudley Buck, and many others. Of these, Thomas Hastings and Lowell Mason deserve special mention for their life-long exertion to spread musical knowledge in this country. Many of the hymns of Hastings have retained their place and popularity in Protestant collections. He published in 1822 *A Dissertation on Musical Taste*, which was widely read, and did much toward the improvement of musical culture. Under the influence of Lowell Mason vocal music received an extraordinary impulse in Boston, and throughout New England. Eminent teachers were introduced into the schools; the Boston Academy of Music was established; and music was prescribed as a regular branch of instruction in the schools of Boston, and subsequently throughout the entire country. His published works, particularly the *Carmina Sacra*, were very popular, and are still in circulation. Hastings and Mason were followed by many imitators who made numerous compilations of hymn-books, Sunday-school melodies, glee-books, etc., which were constantly issued, as they proved for many years the most profitable kind of musical publications. In connection with the subject of church-music the *Gospel Hymns* of P. P. Bliss and Ira D. Sankey should not be forgotten. They were introduced at the time of the Moody and Sankey revivals of 1875 and subsequent years, and were published in a cheap edition, which was sold by the million. Among the most popular were "Hold the Fort;" "Almost Persuaded;" "Pull For The Shore;" "What Shall The Harvest Be?" by P. P. Bliss; the "Ninety and Nine," by Ira D. Sankey; "I Need Thee Every Hour," by Robert Lowry; "What a Friend We Have In Jesus," by Charles C. Converse; and the "Sweet Bye-and-Bye," the words of which were written by S. Fillmore Bennett and the music composed by Joseph P. Webster some years before the *Gospel Hymns* were published. These hymns have been severely criticised for catering to an inferior order of musical taste; but they satisfied the popular craving for pleasing melodies, and were of unquestionable benefit to a certain class of people who afterward were led to the cultivation of higher styles of church-music. It has long been the custom in New York to have the scholars of the various Sunday-schools who are musically inclined, meet in some large hall in their section of the city, one or two evenings a week, for the purpose of receiving competent instruction. They are there taught to read notes at sight, and are made familiar with a better class of sacred music. Sigismund Lasar not long since compiled a Congregational hymnal, with selections of the highest class, aiming at the improvement of public taste.

Many societies were founded at the beginning of this century for the cultivation of oratorios in cities like Boston, New York, Philadelphia, Baltimore, and Albany. Of these, the Boston Händel and Haydn society became the most prominent, and is to-day by many considered the leading organization of its kind in America. Between 1820–40 there were a number of oratorio societies in New York, such as the New York Sacred Musical Society; Euterpeon, etc., which produced *The Messiah; The Creation;* Mozart's requiem-masses, and the masterpieces of Haydn and Beethoven. At the present time nearly every large city of the United States has a similar organization; but opera has not made a permanent home in any one place. The first representation of Italian opera was given in New York in 1825, and the troupe included Garcia, and his daughter Malibran. Since then Ullmann, Maretzek, Strakosch, Carl Rosa, Mapleson, and other managers have brought over European artists to give a season of opera in New York and all the large cities. Among singers who have been heard in this country are: M. W. Balfe (1834); John Braham (1840); Jenny Lind (1850); Teresa Parodi (1850); Catherine Hayes (1851); Henrietta Sontag (1852); Marietta Alboni (1852); Grisi and Mario (1854); Adelaide Philipps (1855); Brignoli (1855); Henrietta Eben (1856); Carl Formes (1857); Pauline Colson (1858); Anna Bishop (1858); Adelina Patti (1859); Carlotta Patti (1861); and Parepa-Rosa (1866). Of operatic singers who have visited America in later years are: Christine Nilsson (1871); Pauline Lucca (1872); Campanini (1873); Capoul (1873); Ilma de Murska (1873); Tamberlick (1873); Maurel (1873); Emma Albani (1874); Teresa Titiens (1875); Wachtel (1875); Anna de Belocca (1876); Minnie Hauck (1876); Mme. Pappenheim (1876); and Etelka Gerster (1877). Of American opera-singers, Clara Louise Kellogg and Annie Louise Cary have achieved considerable reputation; and Emma Albani and Minnie Hauck, though classed by some as foreign singers, were born in this country. English opera was given in this country as early as 1793, when an English troupe performed in Washington and Philadelphia. In 1818 the Phillips company came over, and in 1820 Davis established an opera company in New Orleans. In 1821 Mrs. Holman brought a company to New York. In 1832 came the Woods, and Dunn and Hudson's company. The Seguins came in 1838, and after them the Pyne and Harrison troupe, Madam Bishop, and the Richings opera-troupe. Since then many other companies have been formed; but none have done more for the artistic success of English opera than Clara Louise Kellogg. Among the numerous pianists who have performed in America are: Sigismond Thalberg (1856); Anton Rubinstein (1873); Hans von Bulow (1875); Annette Essipoff (1876); and Rafael Joseffy (1879). It would be difficult to quote the number of excellent American pianists: Louis Moreau Gottschalk, who was born in New Orleans in 1829, and played somewhat in the style of Chopin, was very much admired; and S. B. Mills is ranked as an excellent artist. There have also been a great number of violinists who have played in America—Henry Vieuxtemps (1843); Ole Bull (1844); Camillo Sivori (1846); Camilla Urso (1852); Heinrich Wieniawski (1872); Remenyi (1878); August Wilhelmj (1878). Carl Bergmann, Theodore Thomas, Dr. Leopold Damrosch, Harvey B. Dodworth, and P. S. Gilmore have won distinction as musical conductors. Theodore Thomas established symphony concerts in New York, and finally organized his orchestra which has made him famous in this country and in Europe. The New York philharmonic society, under his leadership, introduces the highest class of music. Among composers who have made a reputation are: Karl Anschütz, George Bristow, F. L. Ritter, Dudley Buck, S. P. Warren, U. C. Hill, Henry C. Watson, A. Bagioli, J. Eichberg, Joseph Mosenthal, Nathan Richardson, Carlo Bassini, Richard Hoffmann, S. B. Mills, G. W. Morgan, Albert W. Berg, H. H. Wollenhaupt, and many others. Although America has not produced a single genius like Beethoven, Chopin, or Verdi, there is one line of composition that has been cultivated with great success, disproving the statement that we are indebted to the foreign element of our population for the music we possess, for the songs that have become the most popular and are endeared to the hearts of our people were composed by Americans. Stephen C. Foster acquired the secret of translating the thoughts, feelings, and sympathies of every-day life into melody. The best-known of his songs is "Old Folks at Home," in which he hoped to rival "Home, Sweet Home," that has become the home-song of the world, and was written by an American author—John Howard Payne. Foster composed many songs which attained great popularity, such as "My Old Kentucky Home;" "Massa's in de Cold, Cold Ground;" "Old Dog Tray;" "Willie, We Have Missed You;" "Ellen Bayne;" "Oh, Susanna;" and "Uncle Ned." All his songs had great pathos and freshness; but "Come Where My Love Lies Dreaming" was his most artistic composition. L. O. Emerson composed "We Are Coming, Father Abraham;" "Out In The Cold." Among his popular sacred songs are: "Stand Up For Jesus;" "Jesus Loves Me;" and his tunes to "Rock of Ages," and "Guide Me, O Thou Great Jehovah," are favorites. George F. Root is the author of the "Battle Cry of Freedom;" "Tramp, Tramp, Tramp;" "Hazel Dell;" and "There's Music In The Air." Harrison Millard composed "Viva l'America," and "Flag of the Free." He is also the author of many ballads, such as "Waiting;" "Under the Daisies;" "When the Tide Comes In;" and "Don't be Sorrowful, Darling." Henry C. Work composed the war songs "Marching through Georgia;" "Kingdom Coming;" "Wake, Nicodemus;" "Grafted into the Army;" "Babylon is Fallen; and "Song of a Thousand Years." He also wrote "Come Home, Father," a temperance song, and "My Grandfather's Clock," which, although of

inferior merit, have become very popular. H. P. Danks has composed a large number of songs, of which "Silver Threads among the Gold" is the best known. Septimus Winner, whose *nom de plume* is Alice Hawthorne, wrote "What is Home without a Mother?" "Listen to the Mocking-Bird;" "I've Sailed the Seas Over; or the Song of Enoch Arden," and many others. J. R. Thomas wrote "The Cottage by the Sea;" "Happy be thy Dreams;" "Some One to Love;" and "'Tis but a little Faded Flower." Mathias Keller, composer of the "American Hymn," wrote "Mother, Oh Sing me to Rest,' and "Thine Image," which were very popular in their day.

Theodore Thomas, in a recent magazine article on the "Musical Possibilities of America," states: "The Americans are certainly a music-loving people. At present the musical standard of the American public, taken as a whole, must be pronounced a low one, though we rightly claim for this country a high rank in cultivation. The greater part of the church-music is a sort of patch-work—a little piece from this composer, and another piece from that—put together by an amateur. This low standard of church-music is not owing to the want of competent organists, for we have many of ability; but rather to the fact that they are hampered in their attempts to introduce better music. Recent years have also given us composers of undoubted merit. It is generally acknowledged that we make the best pianos. Our organs are good, and our brass and reed instruments are of a superior quality. But the most noteworthy fact of all is that we are making the best violins. Some of the first living violinists claim that the violins made by George Gemünder are worthy to rank with those of the famous Italian makers, needing only age to prove their great excellence. It will be seen that we have in this country the possibilities of a great musical future. We have the musical taste of the people for music, their strong desire to have the best, and their readiness to recognize what is best when it is presented to them. We have exceptional natural resources for the making of musical instruments. Nature has done her part of the work generously; it remains for us to do ours."

MUSICAL BOX, a case containing mechanism constructed in such a manner that music can be produced automatically. Machines for making mechanical music have been known since the invention of clocks; but real musical boxes were not introduced till after 1750. They have been greatly improved since then, and some of our modern musical-boxes can play over 100 tunes. The mechanism is similar to that of the barrel-organ. The principal parts are the comb, the cylinder, and the regulator. Bells, drums, and castanets are frequently added to produce musical effects, and in such cases the boxes are sometimes termed mandolins, expressives, quatuors, organocleides, piccolos, etc. When they have a combination of reeds and pipes they are known as flutes, celestial voices, and harmoniphones. Large quantities are exported annually of the musical clocks made in the Black Forest and the musical boxes of Prague, and Sainte Susanne in France. The best musical boxes, however, are manufactured at Geneva, Switzerland.

MUSICAL INSTRUMENTS. The production of sound through musical instruments is always the result of atmospheric vibration. This is effected either directly, by blowing or forcing air in a suitable manner into a tube, or indirectly, by causing a stretched string or other elastic body to vibrate and impart its motion to the surrounding air.

Musical instruments are usually divided into three classes: wind instruments (Ger., *Blasinstrumente*, Ital., *stromentida vento*, Fr., *instruments à vent*); stringed instruments (Ger., *Saiten instrumente*, Ital., *Stromenti da corde*, Fr., *Instruments à cordes*); and instruments of percussion (Ger., *Schlaginstrumente*, Ital., *Stromenti per la percussione*, Fr., *Instruments à percussion*). This arrangement, like most classifications, may not be entirely satisfactory, but it seems the most convenient. Mendel divides musical instruments into: monodic, melodic (Wind and Bowed instruments), and harmonic, polyphonous (Organ, Piano, Harp, Lute, Guitar, Zither, etc.).

The classification usually followed, however, is very old, and, in fact, instruments of all the three classes were known at a very early age. Even when we pass beyond the domain of history into that of myth and tradition, we find mention of the earliest form of both string and wind instruments. Mercury was credited with having invented the lyre, which was suggested to him by a tortoise-shell upon which he found he could produce musical sounds by the fibres of skin stretched across it. Pan, on the other hand, is named as the inventor of the pipe, which, we are told, was originally made of the shank-bone of a crane, as its name, *tibia*, implies. Its invention is also ascribed to Apollo, Orpheus, and others. Our knowledge of the musical instruments of antiquity is seldom very definite, for it is drawn principally from the Bible and the records on the monuments. Some of the writers of those times also throw a little light on the subject. To be brief, it may be said that the principal instruments of olden times were: of the Greeks, the Lyra, Harp, Flute, Kithara, and Pipes; of the Egyptians, the Harp; of the Assyrians, the Dulcimer, Trumpet, and Lyre; of the Hebrews, the Harp, Lyre, Bagpipe, tamboura, Pipes, Syrinx, Drum, and Cymbals. Among the other instruments mentioned in the Bible are the Timbrel, "Ram's Horn," Khalil (pipe), Sistrum, Flute, and Double Flute. The Harp and Lyre were very generally used, and the latter, among the Romans and Greeks, was usually played by twanging the strings with a plektron, and not with the fingers. In Egypt the Harp seems to have been especially favored, and here, as in the Asiatic countries, we find it of peculiar form, in that it has no fore-pillar.

A very full list of instruments used by the principal nations, from the earliest times to the 19th century, is given in Mendel's *Musikalisches Conversationslexikon*, and Engel's *Handbook of Musical Instruments* is also of great interest in this connection. *Musical Instruments and their Homes*, by Mary E. and Wm. Adams Brown (N. Y., Dodd, Mead & Co., 1888), contains very full information regarding the musical instruments of the Oriental nations and of various savage peoples.

Various modern instruments have been evolved from older prototypes. Thus the Chinese instrument *cheng* suggested to Kratzenstein the application of the *free-reed* to certain organ-stops. The ultimate result of this is found in the Harmonium, which has gained so immensely in popularity. Again, the dulcimer, known to the Arabs and Persians as *santir*, is the forerunner of our pianoforte. It was formerly called the *cimbal*, and the clavicembalo, the predecessor of the piano, was simply a cembalo with a keyboard. Similarly, the dulcimer itself, like the harp, can be traced back in the same way to its first rude state of development. The orchestra has undergone many modifications in a comparatively short period. The greater part of the instruments which enjoyed popularity a century ago, are now obsolete, or at least quite changed, and practically new inventions. The number of instruments now in use is but a small proportion of the many that have been invented and employed in the course of time. Different periods saw different ways of combining instruments in performance. So we are told that before Lully it was the custom to have only instruments of the same class play together, and "Concerts for Violins" and "Concerts for Flutes" were common. On the other hand, the Egyptians and certain Asiatic nations use the same instruments to-day that their forefathers pictured three thousand years ago on the monuments that have been preserved to us.

As said before, musical instruments are divided into three classes. These are characterized as follows:

In wind-instruments there is either a pipe or reed provided for each note, or a single tube is used to produce the various notes, in which latter case the change of note is effected either by the action of the lip in blowing, or by varying the length of tube available for the vibrating column of air inside. To the first kind belong the Organ, Harmonium, Concertina, and Accordion. In these, bellows are used for providing wind, which is admitted to each pipe or reed by the action of a key. The Syrinx or Pan's-pipes, however, though having a pipe for each sound, is blown directly with the breath, having neither keys nor bellows; and the Irish Bagpipes, which are provided with bellows, have pipes pierced with holes like a flute. In the Harmonium, popularly known in the United States as the Parlor Organ, it is indirectly the wind that produces the sounds, by effecting and sustaining the vibrations of the metal "reeds."

Hydraulic Organs were known, it seems, as early as 200 years before Christ. The underlying principle of the pneumatic organ had its first origin at a very remote date, but it was not until after the beginning of the Christian era that the organ began to approach in form to the instrument as we have it to-day. Even then, it was for centuries a primitive affair, with but few pipes and enormous keys. It was about the 14th century that the instrument began to undergo great and important improvements, leading ultimately to its present high degree of perfection. The *Regal* is a German organ of small size. Nor should the humbler relatives of the Organ be forgotten: the Hand or Barrel-Organ, and the Orchestrion. The Calliope might also be mentioned here. It consists of a series of steam-pipes, and is played by keys.

The instruments with a single tube are made of wood or metal, generally brass. In the case of two—the Horn and the Trumpet—the various sounds are produced simply by the performer changing the tension of his lips. In the others, the player furthermore varies the length of the tube. This is done in three ways. In the Trombone and Slide Trumpet one part of the tube telescopes with the other. Then, a large number of brass instruments are provided with valves, and these, when pressed add a small portion of tube to the circuit traversed by the wind. To this class belong the Cornet-à-piston, Valve Horn, Valve Trumpet, Saxhorn, Valve Bugle or Flügel-horn, Valve Trombone, Bombardon, Euphonium, Bass Tuba, and Contrabass Tuba. Thirdly, keys are used, by which holes in the tube are uncovered, thus varying the length of tube to be occupied by the column of air in vibration. This contrivance is employed in the Kent or Key Bugle and the Ophicleide. The mouthpiece in all of these is cup-shaped. Wood wind-instruments are also played by keys, or by the fingers uncovering holes in the tubes, and so changing the notes. Some, like the Flute, Fife, Piccolo, and the Flageolet, are played by blowing directly through an opening of suitable shape, while in others the vibrations of a split reed serve to produce the sound. In the Clarinet and Bassethorn this reed is single and is adjusted in a mouthpiece; in the Oboe, Oboe di Caccia or Cor Anglais, Bassoon, and Double Bassoon or Contrafagotto, it is double, two reeds being joined so as to form a tube flattened out at the upper end. The Serpent, unlike the other wood-instruments, has a cup-shaped mouthpiece. It is now rarely used, and the family of German wood-instruments known as *Zinken* (Ital., *Cornetti*), to which it belongs, is quite extinct, although these instruments were used in the church service as late as 1715. These Zinken were of wood, and made of various shapes and sizes. About the 14th and 15th centuries they were very popular, and held a place of much importance in the wind-bands. Gluck is said to have been the last composer of much importance to use the Zinken.

It might be added that Hugo Riemann divides the wind or "blow" instruments (*Blasinstrumente*) into "wood-instruments" and "brass wind-instruments," or better, in reference to the sound-production, into "lip-(labial) pipes" and "tongue-(lingual) pipes." The Organ and like instruments he calls a combination of many wind-instruments.

Stringed instruments are those in which sounds are produced from strings of catgut or wire stretched across a sounding-board. Similar to the wind-instruments, some have a separate string for each note, while others are provided with only three or four strings, which are shortened by pressure with the fingers in order to obtain the various sounds. The vibration of the strings is effected in three ways: Firstly, by friction or rubbing, as in the "bowed instruments" (Ger., *Streichinstrumente*), in which a bow of horse-hair is used, upon which rosin is rubbed. This class of instruments includes the Violin, Viola or Tenor, Violoncello, and Contrabasso or Double Bass. The Welsh Crowth is regarded as the oldest instrument played with a bow. In the Hurdy-Gurdy the bow is replaced by a wooden wheel strewn with rosin. This revolves underneath the strings, its edge producing the friction. In playing the instrument, the right hand turns the wheel, while the strings are shortened by means of keys operated by the left hand. Hugo Riemann divides the bowed instruments into those with frets (Violas, the modern Lyra) and those without frets (Rebec, Vielle, Gigue, Violin, Viola, Violoncello, Contrabasso, Tromba, Marina). A special species of bowed instruments is found in the Hurdy-Gurdy, above referred to, the Piano-Violin, and *Gambenwerk*. Secondly, the sound can be produced by plucking or twanging with the fingers, as in the Harp, Guitar, Lute (obsolete), Mandolin, Banjo, and Zither. In the Harp, which is an instrument of very great antiquity, there is a separate string for each note, while in the others the different notes are produced by varying the length of string that is to vibrate. This is done by pressure of the fingers upon a finger-board provided with little cross-pieces ("frets"), and over which the strings are stretched. The Zither forms an exception. It is provided with 29 or more strings, four or five of which can be "stopped" by the fingers of the player, while the rest produce only one sound each. The Harpsichord and Spinet, now obsolete, are also classed in this division, for in these each key was provided with a small piece of quill or of leather, which, when the key was struck, passed up and plucked the corresponding string. The finger-board in stringed instruments is, as a rule, not met with among savage nations, but almost solely among those rather more advanced in the musical art. Lastly, we have the dulcimer and the pianoforte, which differ from all other stringed instruments in that the sounds are produced by percussion. The strings in the former are struck by two hammers in the performer's hands, in the latter by hammers connected with the keys. In some instruments, mostly obsolete, like the Viola d'Amore, the Norwegian *Hardangerfelen*, and some Arabic instruments, "sympathetic strings" are used. These are thin metal strings placed below the catgut ones so as to be set in soft sympathetic vibration when the latter are struck with the bow.

The instruments of percussion, forming the third class, are of two kinds, those which possess a scale of notes of definite pitch, and those which, as they serve mainly to mark the rhythm, produce one note only, and of no definite pitch. The first kind, which have a relatively higher artistic importance, include the Kettle-Drums, *Glockenspiel* (bells or steel bars used mainly in military bands), and Harmonica, which latter consists of bars of glass, steel, or wood, resting on two cords. A variety of the latter is the *Strohfiedel* (straw-fiddle) or *Holzharmonika*, a xylophon, with its wooden bars resting on straw. All of these instruments are played upon by striking them with hammers or drumsticks. To these must be added the Carrillon, a set of bells played by keys or clockwork. The second kind, that is, the instruments of indefinite pitch, have somewhat aptly been called "noise-instruments" by certain German writers. Of these, the Drum, Bass Drum, Tambour de Provence, Gong, Tam-Tam and Triangle are struck with drumsticks or other suitable implements; others, like the Cymbal and Castagnettes, are played by striking two of them together; while the Tambourine (Tambour de Basque) is simply struck with the hand.

The section "Miscellaneous" seems unavoidable in any classification; so also in that of musical instruments. There are some instruments that will hardly fit into any of the three classes designated. In the Music Box, sounds are produced by employing metal tongues which are plucked by studs or pins projecting from a rotating cylinder. The Jew's-Harp, which possesses but a single tongue, is also played by plucking. The Æolian Harp is a stringed instrument, the strings of which are acted upon by the wind. Again, in the Harmonica, or Musical Glasses, music is produced by rubbing the wetted fingers upon the edges of glass bowls or tumblers into which water has been poured in varying quantity so as to tune the glasses.

Not to speak of the many ephemeral inventions in this branch of industrial art, we have yet to name several instruments which are used mainly for acoustic examinations: the Monochord, the Tuning-Fork, and the Siren.

All kinds of vibrating matter have served man for the production of musical sounds: wood and metal, glass and pottery, horn, bone, and the hides of animals. Hair, silk, fibrous roots, cane, catgut, metal, and runners of creeping plants, have all been used for stringed instruments. We are told in Mendel's work that as pine-wood is especially adapted for the reception of sound-vibrations, it is used in the manufacture of stringed

instruments and of those parts which are to act by vibrating themselves, while Flutes, Clarinets, etc., the bodies of which do not need to vibrate, are made of the more inert ebony, box-wood, ivory, etc.

Beside the works of Brown, Engel, and Mendel, mentioned in the body of this article, the reader is referred especially to John Stainer's *Music of the Bible;* Carl Engel's *Music of the Most Ancient Nations* (London, 1860); F. Zamminer's *Die Musik und die Musikalischen Instrumente* (Giessen, 1855), and the articles on "Instruments" in the musical encyclopædias and dictionaries of Grove, Mendel, Riemann, and Moore. Stringed instruments are treated of very fully in *Researches into the early History of the Violin Family*, by Carl Engel (1883); and *Die Geschichte der Bogeninstrumente*, by Julius Rühlmann (Braunschweig, 1882).

MUSICAL NOTATION, the art of writing or printing music in characters that may be read and preserved. The earliest known system was that of the Greeks, which has been described by Alypius, Aristides, and other Hellenic writers. It consisted of the letters of the Greek alphabet written in a great variety of positions—upright, inverted, on their sides, and broken in half. The details of this system had reference to the peculiar Tetrachords on which the Greek scale depended for existence. Later, Roman letters were applied in alphabetical order to the degrees of the scale. Böethius in the 6th century mentions the use of the first fifteen letters for special purposes, and shortly after the number was reduced to seven. Tradition ascribes this reduction to St. Gregory. For many centuries Roman letters were used in the notation of Plain Chaunt in the west, as the Greek letters were in eastern church music. After the 8th century they were rarely used to denote the music, but they were retained for the degrees of the scale, a practice that survives to-day in the nomenclature of the notes and designation of the clefs. Until about the 8th century no attempt had been made to indicate rhythm and time, and in the MSS. of this period points, lines, accents, curves, hooks, and other hieratic characters called Neumæ were placed over the syllables to signify that the melody should rise and fall. Many species of the Neumæ were known to the mediæval monks, and are found in the MS. Codices of the Middle Ages. One of the most interesting relics of ancient notation is the celebrated *Antiphonarium of St. Gall*, reprinted in Brussels by P. Lambellotte in 1857, and supposed to be a faithful transcript of St. Gregory's *Antiphonary*. In this many of our modern signs are foreshadowed, and this contains the earliest directions for tempo and expression. About the 10th century a long red line was drawn across the parchment, and the Neumæ placed on this line represented the note F, those above G, and those below E. A yellow line was soon added to represent C, and early in the 11th century two black lines were added, the invention of which is attributed to Guido d'Areggo. In the 10th century Hucbaldus, a monk of St. Amand, Flanders, invented a stave, consisting of a vast number of lines, between which he wrote the syllables intended to be sung, and employed no Neumæ. In the ancient MSS. staves of six, twelve, fifteen, and more lines are found, but the difficulty of reading so many lines led to the adoption of two groups, each of four black lines separated by one of red. It was but a step from this to the stave of four lines used for Plain Chaunt. The Bodleian library has a valuable MS., supposed to date from the time of of Ethelred II., in portions of which the notes of Plain Chaunt are written upon the alternate lines and spaces of a four-line stave. The Neumæ system was succeeded by a system of Points, round dots placed on the lines, while the spaces were left vacant, and these were succeeded by notes, which passed through various forms. The earliest indication of a Time Table is in the *Cantus mensurabilis*, written by Franco of Cologne, in the 11th century. He mentions four kinds of notes: the Large, or Double Long, the Long, the Breve, and the Semibreve. One of the earliest works on music, *Practica musicæ*, of Franchinus Gafurius (Milan, 1496), describes the forms which continued in use until the 16th century. The notes of Measured Chaunt were originally black, but afterwards were mixed with red notes. About 1370, white notes, with square, lozenge-shaped heads, sometimes provided with tails, came into use through France, and square black notes were also interspersed. Each kind had its own value, which was governed by Mode, Time, or Prolation, three distinct systems used separately, or in conjunction, and each distinguished by its Time-signature. The flat and natural signs were known before the 11th century; the sharp is traced to the 13th. Accidentals appeared rarely. Indications of Tempo and Dynamic signs were unknown before the 16th century. The Polyphonic composers were methodical in their choice of clefs, and the natural clefs, soprano, alto, tenor, and bass are in use in modern music. The transposed clefs were the acute and grave. Bars were introduced about 1600, and dynamic signs and marks of expression date from the 17th century. With the increasing variations in rhythm, the Time-table, with its system of signatures, was gradually remodeled, and soon graces (q.v.), or agrémens, crept in to ornament the melody. Four of the numerous clefs in use in the 16th century are now employed. Every orchestral instrument has its proper clef; the violin plays in the soprano, or treble clef; the viola in the alto clef; the violoncello in three—bass, tenor, and alto; the double-bass in the bass; the flutes, oboes, and clarinets in the treble; the bassoon in the bass and tenor; the trumpets and horns in the treble, and trombones in the alto, tenor, and bass clefs. The wind instruments in military music stand in a variety of keys, causing complication in notation. See Score, Time, and Tonic sol-fa.

MUSIC-PRINTING. There are three kinds of music-printing: I. Block-printing; II. From engraved copper plates, and III. by lithography. Block-printing was the earliest. The piece of wood or metal was cut away, leaving the characters in relief, and of these an impression upon paper was easily obtained. The earliest known example of music-printing extant is the Mayence Psalter, printed on vellum by Hans Froschauer, in Augsburg, in 1473. This is now in the British Museum. Many of the notes were inscribed by hand. Ottaviano dei Petrucci (1466–1523) was the first to print with movable types. His process was a double one. He printed first the lines of the stave and then the notes upon them. A copy printed by him of Pierre de la Rue's masses (Venice, 1503), is in the British Museum. The objection to his method was the expense, but Erhard Oeglin, of Augsburg, overcame this in 1507 by printing the staves and notes simultaneously. This process was followed by Schöffer in Mainz in 1511, and by the Gardano family in Venice for a century, from 1536. The first attempt in music-printing in England was Higden's *Policronicon*, printed by Wynken de Worde at Westminster, in 1495. This had been printed by Caxton in 1482, but the musical characters were filled in by hand. Both editions are in the British Museum. In Merbecke's *Boke of Common Praier noted* (London, 1550), the printer explains that "The first note is a strene note, and is a breve; the second is a square note, and is a semi-breve; the third is a pycke, and is a mynymme, and the fourth is a close." The English printers, John Day, of Aldersgate, Thomas Vantrollier, Thomas Este, William Barley, and Edward Graffin, made no improvements, but from the time of John Playford, in the reign of Charles II., round notes began to take the place of the lozenge-shape used in writing and printing. The early music-printers of France were Pierre Hautin, Guillaume le Bé, Nicholas Duchemin, R. Granjon, and the Ballards, all of whom made many improvements. Breitkopf, of Leipsic, originated methods in 1755, which were carried further by the house of Breitkopf & Härtel, probably the largest music-printers in the world. A process was invented by Prof. Edward Cooper, of England, in 1827, to print from a raised surface of copper or brass. The characters were inserted into a wooden block, the stave lines were printed separately, and the words to songs were set in ordinary type, then stereotyped, and inserted into grooves prepared in the blocks. Another process was tried in 1856 by Gustav Scheurmann, a music publisher of London. His notes were set in type and impressed on a wax mold, to which the stave lines were added, and a stereotyped cast was then taken. This difficult plan was abandoned. Music printed from types is now stereotyped, the cast preserved for reproduction, and the types used again for other works. Music-printing from engraved copper-plates is thought to have originated in Rome about 1586. In this the notes are engraved in intaglio on a sheet of copper, inked, and an impression taken. This system was introduced into France by the Ballards, who engraved many of Lully's operas. It was also practised in Germany, and J. S. Bach engraved some of his own music. The Dutch originated the idea of softening the metal in order to make an impression by means of a punch. England and Ireland followed this plan, and pewter instead of copper-plates were used. In the third way, lithography, the characters are drawn upon the surface of a certain porous stone, the music being written backward by trained copyists. All three methods are in use. A new French process in printing music, called *Gravure Chimique*, is by punching the musical characters on a pewter plate from which a paper-proof is taken and transferred to a zinc plate. Nitric acid is then applied, which dissolves the zinc, except those portions marked by the ink, and leaves the notes in relief. The ordinary typographic process is then employed.

MUSIC RECORDER. Many forms of apparatus have been invented for writing down music in a legible form by the very act of playing it on a keyed instrument, such as the pianoforte or organ. Beginning with 1747, various attempts had been made practically to effect this object, when, in 1863, Mr. Fenby invented and patented his *phonograph* (quite distinct from Bell's phonograph (see PHONOGRAPH-GRAPHOPHONE), in which he brought in the aid of electro-magnetism. His chief aim, as an improvement on previous apparatus, was to devise a method of denoting the length of the notes, as well as their pitch and the interval between them. On pressing down any key of the instrument, a stud on the under side touches a spring; the spring sets in action a small electro-magnetic apparatus, which causes a tracer to pass against a strip of paper moving onward at a uniform rate by means of a cylinder and clockwork. The paper is chemically prepared, so as to receive a brown stain whenever the tracer passes along its surface. The length of each note is expressed by horizontal dashes of greater or less length, made by the tracer; and the arrangement is such as to denote the lines of the stave as well as the character of the note. By subsidiary adjustments the apparatus is made to express accidental sharps and flats, changes of time, etc.

MUSK, or **MUSK DEER,** *Moschus moschatus*, a ruminant quadruped, the type of the family *moschidæ*. This family differs from *cervidæ* (deer) in the want of horns, and in the long canines of the males, projecting beyond the lips. The musk is an inhabitant of the elevated mountainous regions and table-lands of central Asia. The habits of the musk are very similar to those of the chamois. Its favorite haunts are the tops of pine-covered mountains, but its summer range extends far above the region of pines. Its habits are nocturnal and solitary, and it is extremely timid. It is much pursued by hunters on account of its odoriferous secretion, which has been known in Europe since the 8th c., and is much valued as a perfume. This secretion, *musk*, is produced in a glandular pouch situated in the hinder part of the abdomen of the males; and its natural use seems

to be that of increasing sexual attractiveness. The musk-bag is formed by an infolding of a portion of the skin of the belly, within which a number of membranes are contained, and between these membranes are glands by which the musk is secreted. When newly taken from the animal, musk is soft and almost resembles an ointment; it is reddish-brown, and has an excessively powerful odor. Very little of it reaches Europe unadulterated.—Musk is usually imported either in the form of *grain-musk*, that is, the musk which has been collected chiefly from stones upon which it has been deposited by the animal, in which state it is a coarse powder of a dark-brown color; or in the *pod*, that is, in the musk-sack, which is cut altogether from the animal, and dried with the musk inside. Of both kinds the annual importations are about 15,000 ounces per annum, chiefly from China and India. Small quantities are used in medicine, but the greater portion is employed by the perfumers. It is imported in small boxes or catties, often covered with bright-colored silk, and each containing 25 pods. The kinds generally known in trade are the Tonquin or Chinese; and the Carbardine, Kabardine, or Siberian, which is inferior.

The flesh of the musk is sometimes eaten, but has a very strong flavor. See illus., DEER, ETC., vol. IV.

MUSKALLONGE, or MUSKALLUNG, the *esox estor* of the *esocidæ* or pike family. It inhabits the North American lakes and the St. Lawrence river. Its length is sometimes 50 inches, often weighing 60 pounds. They are caught, either with hook or net, ranging from a few pounds up to this excessive weight. See PIKE.

MUSK DUCK, *Cairina moschata*, a species of duck, of the non-oceanic section of *anatidæ* (see DUCK); of a genus characterized by an elevated tubercle at the base of the bill, the edges of the mandibles sinuated, the face and lores covered with a bare tuberculated skin, the wings furnished with a knob or spur at the bend. The musk duck, or MUSCOVY DUCK—so called, however, through mistake, and receiving its name musk duck more appropriately from its musky smell—is a native of the warm parts of America. It is very plentiful in Guiana, in that part of the year when winter reigns in the north. It is a larger bird than the common duck, in its wild state almost black, with glosses of blue and green, and white wing-coverts, but varies considerably in domestication. It is often to be seen in poultry-yards in America, but is rather curious than profitable. It hybridizes readily with the common duck, but the hybrid is sterile.—The musk duck of Australia is a very different species, belonging to the genus *biziura*.

MUSKE'GON, a co. in s.w. Michigan, along the shores of Lake Michigan; 520 sq.m.; pop. '90, 40,013, chiefly of American birth. Co. seat, Muskegon.

MUSKEGON, city and co. seat of Muskegon co., Mich.: on lake Michigan at the mouth of the Muskegon river and on the Chicago and West Michigan, the Grand Rapids and Indiana, and the Toledo, Saginaw and Muskegon railroads; 38 miles w. of Grand Rapids. It has an excellent harbor, one of the best on the lake, is in daily steamboat communication with Chicago, Milwaukee, and other lake ports, and has a great lumber interest. The city contains the Hackley manual training school, Hendricks hospital, Hauber hospital, Hackley public library, high and graded public schools, Hackley and Lake Michigan parks, waterworks supplied from the lake, electric light and street railroad plants, about 35 churches, and several national and state banks. The industrial plants include lumber and woolen mills, tanneries, furniture factories, marble and granite works, piano factory, iron and steel works, engine and boiler shops, and extensive celery farms. The census of 1890 reported 301 manufacturing establishments, employing $9,863,819 capital and 4,264 persons, paying $1,915,989 for wages and $4,795,251 for materials, and having an output valued at $8,278,160. Pop. '90, 22,702.

MUSKET, or MUSQUET (Fr., *mousquet*; from *mouchet*, a sparrow-hawk, as other shooting-implements were named *falcon, falconet*, etc.), the firearm for infantry, which succeeded the arquebus, and in 1851 gave way before the rifle. See FIREARMS.

MUSKETOON', an obsolete weapon, was a short musket of very wide bore, carrying a ball of 5 oz., and sometimes bell-mouthed like a blunderbuss.

MUSKETRY, SCHOOLS OF. The principle governing the United States and English systems of instruction is that the average excellence in shooting of the individual soldier is the measure of the efficiency of the fire of the army in battle. The principle of the instruction and fire tactics of continental armies is that individuals having learned to point their rifles well, must learn to place their skill entirely under the control of their leaders, with the least possible exercise of individual judgment. The independent fire of the U. S. Army is the natural accompaniment of its loose formation of successive lines of skirmishers without cohesion in themselves or between each other, while the necessities of fire control in continental armies require a skirmish line formed of small cohesive units, supported by successive lines of closed bodies whose size increases to the rear, securing solidity by giving to each commanding officer the support necessary to carry out his own share of the action, so that command is organized in depth rather than in length. Although there is no school of musketry in this country, as is to be found in some of the foreign countries, a great deal of attention is annually given to the matter of target firing, for the purpose of developing knowledge of the rifle, accuracy in its use, and efficiency of fire when bodies of men are acting in concert. The course of instruction embraces three main divisions: preliminary drills and exercises, individual range practice, range or field practice of the company as a body. In each Department there is an Inspector of Rifle Practice to report upon the degree of proficiency attained by the troops,

and accurate records are kept of all the firing that takes place. Each year there is an allowance of ammunition of $7.50 per man ; with reloading and care this is sufficient for 1.500 rounds. The practice begins at the shortest ranges, and the men qualify at every range up to 600 yards before they become *marksmen*, and up to 1000 yards before they become *skirmishers*. Badges are awarded to both sharpshooters and marksmen. The former's badge is worn permanently, and a bar is added to the badge for each three years during which qualification is renewed. The marksman's badge may be worn only until the close of the target year next succeeding the year of issue, unless qualification is renewed. A marksman's pin, which is issued for three qualifications as marksman, is worn permanently. Department, Divisional, and Army teams compete, and prizes are awarded the winners.

The English system differs but slightly from our own. The French have a very thorough system, embracing a great amount of theoretical instruction, and very much more attention is paid to collective firing and battle firing than in the United States. The Germans have school practice, battle practice, and instruction practice, and have a system of medals and rewards for efficiency. Their men are trained to make a judicious selection between two sights and of the point of aim, rather than to fumble with a sliding leaf at the critical instant of close action. They spend but little time in individual instruction at ranges over 400 metres, and beyond 600 metres such effort is thought useless. Great importance on the other hand is attached to mass firing at ranges over 400 metres. The Italians go very much more than other armies into the questions relating to effects of range on efficiency of fire : vulnerability of different formations, including the various positions taken by men when firing ; the use of the magazine ; and the effects of rapidity of fire on accuracy—reaching the conclusion that infantry, either in close or skirmishing order, firing at will with good aim, readily expends three rounds a minute and that it is better to economize ammunition by pauses in the firing, than to try to fire slowly and continuously.

MUSKING'UM, a co. in s.e. central Ohio ; drained by the Licking and Muskingum rivers and several creeks ; intersected by the Baltimore and Ohio, the Pittsburg, Cincinnati and St. Louis, and the Muskingum Valley railroads ; about 651 sq.m.; pop. '90, 51,210, chiefly of American birth. The surface is undulating and the soil fertile ; there are forests of valuable woodland ; wheat, Indian corn, hay, and dairy products are the staples ; coal, iron, and limestone are found. The Ohio canal passes through the county; and there are numerous factories of bricks, carriages, saddles and harness, woolen and cotton goods, etc. Co. seat, Zanesville.

MUSKING'UM RIVER, flowing s.e. through Ohio, and emptying into the Ohio river; formed by the junction of the Tuscarawas and Walhonding rivers. The entire length from Coshocton to Marietta is 115 m., and the stream passes through Muskingum, Morgan, and Washington counties, and is navigable as far as Dresden. The river furnishes water-power for many factories at Zanesville and Marietta and elsewhere.

MUSKOKA, a free grant district in n. Ontario, Canada; forming with Parry Sound an electoral district; pop. of latter, '91, 26,515. Co. town, Bracebridge.

MUSK OX, *Bos moschatus*, or *Ovibos moschatus*, an animal of the family *bovidæ*, regarded as a connecting-link between oxen and sheep. It inhabits the most northern parts of America, enduring the winter even of Melville island and Banks' land; but, like many other animals, it is partially migratory, some individuals or herds seeking more southern regions and better pastures on the approach of winter, while some remain in the furthest north. It is not found in Greenland, Spitzbergen, or Siberia. The musk ox is scarcely equal in size to the smallest of Highland cattle, but appears larger from the profusion of long matted woolen hair with which it is covered, and which hangs almost to the ground. The head is covered with long hair as well as the body, the face alone having short hair. Beneath the long hair there is a thick coat of exquisitely fine wool. The head is large and broad; the forehead convex; the extremity of the muzzle hairy. The horns are very broad at the base, and in the male meet on the forehead; they do not rise but bend down on each side of the head, and curve outwards and upwards towards the tip, which tapers to a sharp point. They are about 2 ft. long measured along the curvature; and about 2 ft. in girth at the base; a pair of them sometimes weighing 60 pounds. The limbs are short, the legs have short hair. The tail is very short, and is covered with long hair, so that it is undistinguishable to the sight. The general color is brown. The female is smaller than the male, has shorter hair on the chest and throat, and smaller horns. The frog of the hoof is short and partially covered with hair; the foot-marks are very similar to those of the reindeer.

The musk ox feeds on grass, twigs, lichens, etc. It is fleet and active, very sure footed on rocky ground, and ascends or descends very steeps hills with great ease. It is gregarious; the herds generally number 30 or 40. The powerful horns are excellent weapons of defense against wolves and bears, which are often not only repelled but killed. When musk oxen are assailed by firearms, however, they generally huddle more and more closely together, and do not even seek safety by flight, so long as the assailants are unseen. The flesh is much prized by the Esquimaux, but retains much of the strong musky odor which characterizes the living animal. The horns are used for various purposes; particularly the wide base for vessels. The fine wool has been spun

and woven into a fabric softer than silk. No attempt has yet been made to domesticate the musk ox. See illus., MAMMALIA, vol. IX.

MUSK PLANT, MUSK ROOT, MUSK TREE, MUSK WOOD. Different parts of a number of plants smell more or less strongly of musk. Among these are the common little musk plant, the musk-tree of Van Diemen's land (see ASTER), and the musk ochro (see HIBISCUS).—The musk-tree of Jamaica (*moschoxylum swartzii*) belongs to the natural order *meliaceæ*. It emits from all parts a smell of musk.—All parts of *guarea grandifolia*, another tree of the same order, a native of the West Indies, sometimes called musk wood, also smells strongly of musk, but particularly the bark, which is used in perfumery.—The drug called MUSK ROOT or SAMBUL is brought from the east, and is the root of a plant supposed to be of the natural order *umbelliferæ*; but the plant is unknown, nor is it certain whether its native country is Persia, or some more remote region of central Asia. It has a pure musky odor, and is used as a substitute for musk.

MUSK RAT, or DESMAN (*mygale* or *galemys*), a genus of insectivorous quadrupeds of the shrew (q.v.) family (*soricidæ*), differing from the true shrews (*sorex*) in having two very small teeth between the two large incisors of the lower jaw, and the upper incisors flattened and triangular. Behind these incisors are six or seven small teeth (lateral incisors or false canine teeth) and four jagged molars. The muzzle is elongated into a small flexible proboscis, which is constantly in motion. The eyes are very small; there are no external ears; the fur is long, straight, and divergent; the tail long, scaly, and flattened at the sides. All the feet have five toes, fully webbed; and the animals are entirely aquatic, inhabiting lakes and rivers, and making holes in the banks with the entrance from beneath the surface of the water. Only two species are known, one (*M.* or *G. pyrenaica*) about 8 in. long, with tail as long as the body, a native of the streams of the Pyrenees; another larger species (*M.* or *G. moschata*), very plentiful in the Volga and other rivers and lakes of the s. of Russia, nearly equal in size to the common hedgehog, with tail about three-fourths of the length of the body. The Russian desman is blackish above, whitish beneath; it has long silky hair, with a softer felt beneath, and its fur is held in some esteem. Desman skins, however, are chiefly valued on account of the musky odor which they long exhale, and which is derived from a fatty secretion produced by small follicles under the tail of the animal. The desman feeds on leeches, aquatic larvæ, etc., searching for them in the mud by means of its flexible proboscis. It seldom, if ever, voluntarily leaves the water, except in the interior of its burrows, which are sometimes 20 ft. long.

MUSK RAT, *Sorex murinus*, an Indian species of shrew (q.v.), in size about equal to the common brown rat, in form and color much resembling the common shrew of Britain, but remarkable for the powerful musky odor of a secretion which proceeds from glands on its belly and flanks.

MUSK RAT. See MUSQUASH.

MUSLIN, a cotton fabric of oriental origin, is said to have derived its name from the town of Mosul, in Mespotamia, where this material was at one time very largely manufactured. At present no such trade exists there; and for muslins, of the common kinds at least, the Indian market depends upon the manufactures of England and France. But no European manufacturer has ever been able to rival the wonderfully fine muslins of Dacca. This does not arise so much from the fineness of the yarn, although that too is very great, but from the marvelous fineness conjoined with a most delicate softness to the touch. The fineness of the yarn is so great that until lately no machinery could produce anything like it; a piece of Dacca muslin, shown in the international exhibition (1862), was 31 ft. in length by 3 ft. in width, and contained in a square inch 104 warp threads and 100 weft threads, yet the entire piece weighed only 3¼ ounces. A French manufacturer, M. Thivel Michon of Tavare, has made a muslin of English yarn spun by the Messrs. Houldsworth of Manchester, which surpassed the finest Dacca in the excessive thinness of the yarn, but it wanted its delicate softness. Muslin is much less compact in its texture than calico, indeed it more nearly resembles gauze in appearance; but it is woven plain, without any twisting of the weft threads with those of the warp. The manufacture of muslins in Great Britain and France is very extensive, especially printed muslins, in which the patterns are produced by the same processes as in calico-printing. See WEAVING.

MUSNUD, a Persian throne of state.

MUSOPHA'GIDÆ. See PLANTAIN-EATER.

MUS'PRATT, JAMES SHERIDAN, PH.D., 1821–71; b. Ireland; when a boy made a tour on the continent, and studied chemistry with Prof. Graham of Glasgow. In 1838 he possessed sufficient knowledge of chemistry to take charge of the chemical department of a large Manchester manufactory. After an unsuccessful business experiment in America, he resolved to devote himself entirely to the study of chemistry, which he pursued under Liebig, at Giessen, 1843–45. There he published an edition of Plattner's *Treatise on the Blowpipe*, and took the degree of PH.D., with a thesis tracing the resemblance between the carbonates and sulphites. In 1847 he produced a number of new substances from the sulpho-cyanides of ethyl and methyl. On his return to England in 1848 he established and became superintendent of a college of chemistry at Liverpool. From 1854 to 1860 he was engaged on a dictionary of chemistry, which was also pub-

lished in this country and translated into French and German. His *Outlines of Quantitative Analysis for Students* has had a considerable circulation,

MUS'QUASH, Musk-rat, or Ondatra, *Fiber zibethicus*, a rodent quadruped, a native of North America, It is the only known species of the genus to which it belongs which is characterized by dentition similar to that of the voles; in some other characters more nearly agreeing with the beaver. The musquash is in shape nearly similar to the brown rat; the head and body are about 15 in. in length, the tail 10 inches. The whole body is covered with a short downy dark-brown fur, intermixed with longer and coarser hairs. It is common in almost all parts of North America, from lat. 30° to lat. 69°, except in the southern alluvial districts. It is a very aquatic animal, seldom wandering from the rivers, lakes, or marshes in which it makes its abode. The fur is in demand, and forms an article of commerce—skins in large number being still exported from America to Britain and other European countries. The musquash burrows in the banks of streams and ponds; the entrances of its burrows being always under water, so that it must dive to reach them. In marshes the musquash builds a kind of hut, collecting coarse grasses and mud, and raising the fabric from 2 to 4 ft. above the water. The flesh of the musquash, at those seasons when it is fat, is in some request among the American Indians, and is said to be not unpalatable.

MUSSEL, *Mytilus*, a genus of lamellibranchiate mollusks, the type of the family *mytilidæ*, which, however, is much more restricted than the Linnæan genus *mytilus*. The *mytilidæ* belong to the division of *lamellibranchiata*, called by Lamarck *dimyaria*, having two *adductor* muscles—muscles employed in closing the valves of the shell. The mantle has a distinct anal orifice; the foot is small; and there is a large *byssus* (q.v.), which is divided into fibers to its base. The valves of the shell are equal; the hinge is destitute of teeth. Some, but few, of the species are found in fresh water. See Dreissena. Some (*lithodomus*) burrow in stone. How they do it is utterly unknown, but they do burrow even in the hardest stone; and some small tropical species excavate for themselves holes in the shells of great limpets. The *lithodomi* are sometimes called *date-shells*. Some of them are very beautiful, which is the case also with the true mussels, after the epidermis is removed. Even the Common Mussel (*M. edulis*) then exhibits beautiful veins of blue. This species is very abundant on the British coasts, and is much used as bait by fishermen. It is gregarious, and is found in vast beds, closely crowded, adhering by the byssus to rocks, etc. These beds are usually uncovered at low water. The shell is oblong; at its greatest size about 3 in. long, and an inch and a half broad. Mussels, when young, move about by means of the foot, with which they lay hold of objects and drag themselves along, until they find some suitable spot to anchor themselves by a byssus. If detached, they soon find another anchorage. In an aquarium they readily attach their byssus-threads even to the smooth glass, and the threads may be broken more easily than separated from the glass. An ingenious and important application of the strength of these threads has been made by the French, to render Cherbourg breakwater more secure by binding the loose stones together, for which purpose it was *planted* with tons of mussels. The common mussel is much used as an article of food, and is generally found quite wholesome; yet it sometimes proves poisonous, particularly in spring and summer, either causing blotches, swellings, and an eruption, accompanied with asthma, or a kind of paralysis, and even sometimes producing delirium and death. See Fresh-water Mussel. See illus., Molluscs, figs. 6, 11, 13.

MUS'SELBURGH, a small seaport town and parliamentary burgh of Scotland, in the county of Edinburgh, is situated at the mouth of the Esk, 3½ m. n. by e. of Dalkeith. On the west side of the Esk is the fishing village of Fisherrow. Tanning, leather-dressing, and the manufacture of sail-cloth, nets, and salt are carried on. The harbor at Fisherrow is frequented by coasting craft, and by small vessels from Holland and the Baltic. Timber, oil-cake, bark, seeds, and hides are imported; coal is the chief export. On the "links," a famous golfing ground, the Edinburgh races take place annually. Musselburgh unites with Leith and Portobello in sending a member to parliament. Pop. '91, 1888.

MUSSET, Louis Charles Alfred de, one of the foremost of recent French poets, was b. at Paris Nov. 11, 1810. He studied in succession medicine, law, finance, and painting; but finally, under the influence of the romantic school (q.v.), devoted himself to poetry. The first work that attracted notice was *Les Contes d'Espagne et d'Italie* (1830), which by their elegant but audacious sensuousness gave deep offense. *Le Spectacle dans un Fanteuil* (1832) is a strange medley of contrasts. *Les Nuits* (1840) admittedly show his lyrical power at its best. Many of the *Comédies et Proverbs* were popular on the stage; and Musset wrote several prose romances. In 1852 he was admitted to the French academy. He died at Paris May 2, 1857. The exquisite beauty, tenderness, and power of much of Musset's work is continually marred by the morbid pessimism of a man prematurely old, disillusioned, *blasé;* on this very ground Musset is often regarded as the representative poet of the modern Parisian.

MUSSEY, Reuben Dimond, an American surgeon; b. N. H., 1780; d. Boston, 1866; graduated at Dartmouth, 1803; Philadelphia 1809; practiced medicine and surgery at Salem 1809–14; professor of practice of medicine at Dartmouth 1814–19, and of anatomy and surgery from the latter date to 1838, when he removed to Cincinnati and

became professor of surgery in the Cincinnati college of medicine and surgery, occupying the chair till 1852, when he was appointed professor of surgery in the Miami medical college, where he remained till 1860, when he removed to Boston. He was a bold and successful operator, and was the first to ligate both common carotid arteries, an operation which was successful in its results.

MUSSEY, William Heberdon, m.d., 1818–82; b. Hanover, N. H.; son of Reuben D.; d. Cincinnati, O.; graduated at the Ohio Medical coll., 1848; and subsequently studied in Paris. He settled in Cincinnati, and practiced as a surgeon; was vice-president of the American medical asso., 1864, and subsequently of the Ohio State medical asso.; and held various positions in hospitals and colleges; was commissioned brigade-surgeon, 1861, and lieut.-col. and medical inspector of the U. S. army, 1862, and for a number of years was surgeon-general of Ohio. He founded the Mussey medical and scientific library, in Cincinnati, to which he gave several thousand publications; and was president of the Natural History society of Cincinnati.

MUSSULMAN, *Mosleman*, a Mohammedan (from Arab. *Salama*), equivalent to Moslem, of which word it is, properly speaking, the plural; used in Persian fashion for the singular. We need hardly add that this Arabic plural termination of "án" has nothing whatever to do with our word *man*, and that a further English plural in *men* is both barbarous and absurd.

MUSTANG. See Horse.

MUSTARD, *Sinapis*, a genus of plants of the natural order *cruciferæ*, having yellow flowers, and linear or oblong pods, which terminate in a sword-shaped and compressed or 4-cornered beak, and contain one row of seeds. The seeds are globular, and their cotyledons conduplicate.—The most important species is Black Mustard (*S. nigra*), an annual, which grows wild in fields and by waysides in the middle and south of Europe, and is not uncommon in the southern parts of Britain. Its pods are bluntly 4-angled, smooth, erect, and lie close to the stem, their valves 1-nerved; the leaves are smooth, the lower leaves lyrate, the upper leave linear-lanceolate. The seeds are brownish black.—White Mustard (*S. alba*), also a native of most parts of Europe, and of the southern parts of Britain, is an annual, having divergent pods covered with stiff hairs, the valves 5-nerved, the seeds yellowish, the leaves pinnatifid.—Both these species are cultivated in England and elsewhere, for their seeds, which are ground into powder and mixed with water, to make the well-known condiment called *mustard*. The powder of the seeds is also much used in medicine as a rubefacient. The use of mustard as a condiment is often found favorable to digestion. Mustard seeds depend for their pungency on a principlewhich, when water is added to black mustard, forms *volatile oil of mustard*. (See next article.) There is also in the seeds a bland fixed oil, *oil of mustard*, which is obtained from them by expression, and constitutes about 28 per cent of their weight. The cake which remains after the oil is expressed is too acrid to be freely used for feeding cattle. It is black mustard which is chiefly cultivated, its seeds being more pungent and powerful than that of white mustard; but there is more difficulty in removing the skin of its seed than that of white mustard, which is therefore often preferred, but more in England than on the continent of Europe. Mustard requires a very rich soil. It is cultivated on the alluvial lands of the level eastern counties of England. Wisbeach, in Cambridgeshire, is the great mustard market of England.—White mustard is often sown in gardens and forced in hot-houses, to be used in the seed-leaf as a small salad, having a pleasant pungency. It is also sometimes sown for feeding sheep, when turnip or rape has failed, being of very rapid growth, although inferior in quantity of crop.—Wild Mustard, or Charlock (*S. arvensis*), which is distinguished by turgid and knotty pods with many angles and longer than the two-edged beak, is a most troublesome annual weed in cornfields in Britain, often making them yellow with its flowers in the beginning of summer. Its seeds are said to have yielded the original *Durham mustard*, and are still gathered for mixing with those of the cultivated species. The bland oil of the seeds is used for lamps.—Pekin Mustard (*S. Pekinensis*) is an annual, very extensively cultivated in China, its leaves being used as greens. It is quite hardy in the climate of Britain.—Indian Mustard (*S. ramosa*) is extensively cultivated in India for its seeds, which are used as a condiment; as are those of *S. dichotoma* and *S. glauca*, also cultivated in India. The oil of the seeds is much used throughout India for lamps.—Hill Mustard is a different genus, *bunias* (q. v.)—The Mustard Tree of Scripture is supposed to be *salvadora Persica*, a small tree of the natural order *salvadoraceæ*, a small order allied to *myrsinaceæ*. It abounds in many parts of the east. The seed has no aromatic pungency, and is used like mustard. The fruit is a berry with a pungent taste.

Manufacture.—The manufacture of mustard as it was originally used in this country, and as it still is on the continent, consisted in simply grinding the seed into a very fine meal. A false taste, however, arose for having an improved color, and the flour of mustard was introduced, in which only the interior portion of the seed is used, the husk being separated, as the bran is from wheaten flour. This causes a great loss of flavor, as the pungent oil, on which the flavor chiefly depends, exists in greatest abundance in the husk.—Hence other materials, such as capsicum powder, and other very pungent matters, are added to bring up the flavor, and wheaten flour and other substances are added to increase the bulk and the lightness of color.

MUSTARD, Oil of. The seeds both of the black and the white mustard yield by expression a large quantity of a bland fixed oil, but they do not contain any essential or volatile oil ready formed. It is only the black mustard which by distillation yields the compound usually known as the oil or essence of mustard, and which is in reality sulphocyanide of allyl (see Garlic, Oil of) contaminated with a little brown resinous matter, from which it may be freed by simple re-distillation.

When first obtained, it is a colorless fluid, which gradually becomes yellowish. It has a painfully pungent odor and acrid taste; and when applied to the skin, it speedily raises a blister. It is soluble in all proportions in alcohol, but dissolves very sparingly in water. In the article already referred to, it has been shown that this oil and oil of garlic are naturally convertible into one another; in combination with ammonia it forms a compound which is termed *thiosinnamine*, or *allylthio urea*, and which combines directly with acids like a true organic base. Its mode of formation is explained by the equation:

$$\overbrace{C_3H_5\cdot N:C:S}^{\text{Oil of Mustard.}} + \overbrace{NH_3}^{\text{Ammonia}} = \overbrace{CS:(NH_2)(NHC_3H_5)}^{\text{Thiosinnamine.}}$$

By digesting oil of mustard with alkalies, or with hydrated oxide of lead, we also obtain a feeble base termed *sinapoline*, or *diallyl urea*, $CO:(NH\cdot C_3H_5)_2$.

The oil is formed in much the same way as the volatile oil of almonds (q.v.) The black mustard contains the potash salt of a compound termed *myronic acid*, and a peculiar coagulable nitrogenous ferment, which, when the crushed seed is moistened with water, act upon each other, and develop the oil. It is the gradual formation of this oil, when powdered mustard and warm water are mixed, that occasions the special action of the common mustard poultice. The pungency of mustard as a condiment, of horse-radish, etc., is mainly due to the presence of this oil.

MUSTELIDÆ, a family of digitigrade carnivora (q.v)., mostly forming the genus *mustela* of Linnæus; now divided into a number of genera, in which are ranked the weasel, ermine or stoat, sable, marten, ferret, polecat, mink, skunk, etc. The mustelidæ are distinguished by the elongated form of the body and the shortness of the limbs; also by having generally four or five molars on each side in the upper jaw, and five or six in the lower. On each side of both jaws there is a single tuberculate tooth. All the feet have five toes. The skull is much elongated behind the eyes. The mustelidæ display great litheness and suppleness of movement. They are very carnivorous. Otters are ranked among the mustelidæ.

MUSTER (It. *mostrare*, from Lat. *monstrare*, to show) is a calling over of the names of all the men composing a regiment or a ship's company. Each man present answers to his name, those not answering being returned as absent. The muster-roll from which the names are called is the pay-master's voucher for the pay he issues, and must be signed by the commanding officer, the adjutant, and himself. The crime of signing a false muster-roll, or of personating another individual at a muster, is held most severely punishable—by imprisonment and flogging for a common soldier, by immediate cashiering in the case of an officer. In regiments of the line a muster is taken on the 24th of each month; in ships of war, weekly. The muster after a battle is a melancholy proceeding, intended to show the casualties death has wrought. The word muster was formerly in general use in this country as a term for the annual review and inspection of the militia; a sense which it still has in the state of Massachusetts. See General Training Day, under Day.

MUTE, a small instrument used to modify the sound of the violin or violoncello. It is made of hard wood, ivory, or brass, and is attached to the bridge by means of a slit, a leg of it being interjected between every two strings. The use of the mute both softens the tone and imparts to it a peculiar muffled and tremulous quality, which is sometimes very effective. Its application is indicated by the letters *c.s.*, or *con sordino*, and its discontinuance by *s.s.*, or *senza sordino*. The mute is sometimes used for the cornet, being inserted into the bell of the instrument, thereby subduing the sound and producing the effect of great distance.

MUTINY (Fr. *mutiner*, from *mutin*, "riotous." "Mutin" is connected with the old French *meute*, still seen in *émeute*, a "sedition," and is therefore from the Latin *movere*, "to move" or "stir up." The supposition that the word is derived from the Latin *mutio*, a "muttering," is a mistake). The term is used to denote behavior either by word or deed subversive of discipline, or tending to undermine superior authority. Till lately mutiny comprised speaking disrespectfully of the sovereign, royal family, or general commanding, quarreling, and resisting arrest while quarreling; but these offenses have now been reduced to the lesser crime of "mutinous conduct." The acts now constituting mutiny proper are exciting, causing, or joining in any mutiny or sedition; when present thereat, failing to use the utmort effort to suppress it; when, knowing of a mutiny or intended mutiny, failing to give notice of it to the commanding officer; striking a superior officer, or using or offering any violence against him while in the execution of his duty: disobeying the lawful command of a superior officer. The punishment awarded by the mutiny act to these crimes is, if the culprit be an officer, death or such other punishment as a general court-martial shall award; if a soldier, death,

penal servitude for not less than four years, or such other punishment as a general court-martial shall award. As the crime of mutiny has a tendency to immediately destroy all authority and all cohesion in the naval or military body, commanding officers have strong powers to stop it summarily. A drum-head court-martial may sentence an offender, and if the case be urgent, and the spread of the mutiny apprehended, the immediate execution of the mutineer may follow within a few minutes of the detection of his crime. It, however, behooves commanding officers to exercise this extraordinary power with great caution, as the use of so absolute an authority is narrowly and jealously watched. To prevent mutiny among men the officers should be strict without harshness, kind without familiarity, attentive to all the just rights of their subordinates, and, above all things, most particular in the carrying out to the very letter of any promise they may have made.

MUTINY ACT was an act of the British parliament passed from year to year, investing the crown with powers to regulate the government of the army and navy, and to frame the articles of war. By the bill of rights, the maintenance of a standing army in time of peace, unless by consent of parliament, was declared illegal, and from that time the number of troops to be maintained, and the cost of the different branches of the service, have been regulated by an annual vote of the house of commons. But parliament possesses a further and very important source of control over the army. Soldiers, in time of war or rebellion, being subject to martial law, may be punished for mutiny or desertion; but the occurrence of a mutiny in certain Scotch regiments soon after the revolution, raised the question whether military discipline could be maintained in time of peace; and it was decided by the courts of law, that, in the absence of any statute to enforce discipline and punish military offenses, a soldier was only amenable to the common law of the country: if he deserted, he was only liable for breach of contract, or if he struck his officer, to an indictment for assault. The authority of the legislature thus became indispensable to the maintenance of military discipline, and parliament has, since 1689, at the beginning of every session, conferred this and other powers in an act called the mutiny act, limited in its duration to a year. Although it is greatly changed from the form in which it first passed, 175 years ago, the annual alterations in this act are now very slight, and substantially it has a fixed form. The preamble starts with the above quoted declaration from the bill of rights, and adds that it is judged necessary by the sovereign and parliament that a force of such a number should be continued, "for the safety of the United Kingdom, the defense of the possessions of the crown;" while it gives authority to the sovereign to enact articles of war for the control and government of the force granted. The act comprises 107 clauses, of which the first five specify the persons liable to its provisions—viz., all enlisted soldiers or commissioned officers on full pay, and to those of the regular army, militia, or yeomanry, when employed on active service, and to recruits for the militia while under training. Clauses 6 to 14 treat of courts-martial, their procedure and powers. Clauses 15 to 28 relate to crimes and their punishment, the leading offenses being mutiny, desertion, cowardice, treason, insubordination, for each of which death may be the penalty; frauds, embezzlement, etc., for which penal servitude is awarded. Clauses 29 to 33 provide for the government of military prisons, and for the reception of soldiers in civil jails, under the sentences of courts-martial. Clauses 34 to 37 enact rules to guide civil magistrates in apprehending deserters or persons suspected of desertion. Clause 38 refers to furlough; 39 to 41, on the privileges of soldiers, enact that officers may not be sheriffs or mayors; that no person acquitted or convicted by a civil magistrate or jury be tried by court-martial for the same offense; and that soldiers can only be taken out of the service for debts above £30, and for felony or misdemeanor. Clauses 42 to 59 have reference to enlistment (q.v.); 60 to 74 to stoppages, billets, carriages, and ferries, providing for the compulsory conveyance and entertainment of troops by innkeepers. Clause 75 relates to the discharge of soldiers; and the remaining 23 clauses advert to miscellaneous matters, and the penalties under the act on civil functionaries who neglect to comply with its requirements. By clauses 105 and 106 the militia, yeomanry, and volunteers, may, on emergency, be attached to the regular forces. Clause 107 renders a soldier liable to maintain his wife and children, and his bastard children.

MUTIUS SCÆVOLA. See MUCIUS SCÆVOLA.

MUTSUHITO or MUTS-HITO. The present reigning emperor of Japan, and the 123d mikado of the line. His name means the "man of peace," or "weak man." He has no family name. He is the second son of the mikado Komei Tennō (1847–67); his mother Fujiwara Asako. He was born Nov. 3, 1852, and grew up in the palace at Kioto, never seeing a foreigner until his nineteenth year. On the death of his father Jan. 30, 1867, he was declared emperor under the care of a regent. Upon the *coup d'etat* of Iwakura and others, Jan. 3, 1868, the regent was dismissed. Mutsuhito became the active mikado, and the new government was proclaimed; the decree abolishing forever the office of "tycoon" being dated Feb. 4. On March 23 he gave the first audience ever granted by an emperor of Japan to representatives of Christian nations, the envoys of France and Holland being admitted. The British minister (see PARKES, SIR H. S.) who on the 27th attempted a similar audience, had his cortege attacked by assassins. On March 28 the imperial decree was issued by which treaty relations with foreign

nations were for the first time acknowledged by the mikado, and all fanatics who should attack foreigners were outlawed. On April 6, in the great hall of the castle of Nijo in Kioto, occurred the most momentous act of his life, and thence dates the real beginning of modern Japan. In presence of the court nobles and feudal princes (daimios) the mikado took the oath which is now the basis of the new government. The first clause of this oath is as follows : "The practice of discussion and debate shall be universally adopted, and all measures shall be adopted by public argument." Besides this he promised that the "uncivilized customs of former times" should be broken through, and intellect and learning sought for throughout the world, to assist in leading Japan into the path of modern civilization. From this oath the reforms of the past twelve years have proceeded, and the drift of Japanese politics toward constitutional government has begun. On Feb. 7, 1869, he removed the national capital to Tokio, and soon after married Ichijo Tadaka, a noble lady of the 2d degree of the 1st rank. In 1872 he adopted European dress and habits of life, and has since made many tours throughout the empire, completely revolutionizing the old traditional court and governmental etiquette. It is largely to his able guidance that the nation owes the policy that has at last defeated Japan's traditional rival and enemy, China, and won for the island empire a place in the front rank of nations. See JAPAN.

MUTTRA, a municipality of British India, capital of a district in the N.W. Provinces, 23 m. n.n.e. of Bhartpur, is situated on the right bank of the Jumna. The fort was built by the celebrated astronomer, Jey Singh (who became prince of Amber in 1693); and on the roof of one of the apartments is a ruinous observatory, containing a great number of astronomical instruments. Access is had to the river—which, along with the town, is considered sacred by the Hindus—by numerous ghâts, ornamented with little temples; and its banks are, every morning and evening, crowded by devotees of all ages and both sexes, to perform their religious exercises. In Hindu mythology, it is regarded as the birthplace of the divinity Krishna. In honor of the monkey-god Hanuman, monkeys are here protected and fed, being allowed to swarm everywhere. There are also great numbers of paroquets, peacocks, and sacred bulls at large, without owners. There is a very extensive military cantonment about a mile s. of the town. Muttra appears at an early period to have been of much more importance than it is at present; and its enormous wealth and splendor made it an object of attack to the first Afghan invaders. Mahmud of Ghuznee, in 1017, gave it up to plunder, breaking down and burning all the idols, and amassing a vast quantity of gold and silver, of which the idols were made. After this calamity, it sank into comparative obscurity. In Oct., 1803, it was, without resistance, occupied by the British troops. Pop. '91, 56,400.

MU'TUAL INSTRUCTION. See MONITORIAL SYSTEM.

MU'TULE, a plain block under the corona of the cornice of the Doric style, similar in position to the modallio of the Corinthian order, and having a number of guttæ or drops worked on the under side. See ENTABLATURE.

MUYSCAS, or CHIBELAS, a nation of Indians w. of the Andes, in New Granada, as far as the vicinity of Santa Fé de Bogota. They seem to have been the nearest in civilization to the Quichuans. They were quickly Christianized, and, like all these tribes, on the expulsion of the Jesuits, decreased rapidly in numbers and intelligence. It seems uncertain whether the language is really extinct, but it was simple, and is usually considered unconnected with any neighboring group.

MUZA IBN NOSEYR, the Arab conqueror of Spain, was born 640 A.D. He displayed great bravery and high military talents in the contests of that turbulent period, so much so that he was appointed by the caliph general of the army which was raised for the conquest of Africa in 698–99. After an insignificant expedition into the interior of Africa, he set out in 707 for Mauritania, conquering the kindred tribes of eastern Barbary, and enrolling their warriors under his standard; and by 709 the whole of northern Africa, including the Gothic strongholds on the coast, acknowledged the authority of the caliph. At this period the Gothic monarchy in Spain was in a state of complete disorganization, and Muza Ibn Noseyr, seizing the favorable opportunity thus presented, sent his lieut., Tarik Ibn Zeiad, in April, 711, to make an incursion into Spain. Tarik landed at Gibraltar, marched inland to the banks of the Guadalete, where he was met bp Roderic the Gothic king. In the battle which ensued the Goths were decisively vanquished, their king perished in the waters of the Guadalete, and the whole of southern Spain lay at the mercy of the victor. Muza Ibn Noseyr, on hearing of these successes, sent orders to Tarik to halt for further instructions; but the lieutenant, flushed with success, pressed on to the very center of Spain, and seized Toledo, the capital of the Gothic kingdom. Muza Ibn Noseyr immediately set out for Spain at the head of 18,000 men (June, 712), took Seville, Carmona, Merida, and other towns, and then marched upon Toledo, where he joined Tarik, whom he caused to be bastinadoed and incarcerated, but afterwards reinstated in obedience to an order from the caliph. Muza Ibn Noseyr then marched first n.w. and then e., subduing the country as he went; he then crossed the Pyrenees into France, but soon after returned to Spain, where he and Tarik received messages from the caliph, commanding their immediate presence at

Damascus; Tarik immediately obeyed, but Muza Ibn Noseyr delayed till a second message was sent to him. On reaching Damascus he was treated with neglect, and, on the accession of the caliph Suleiman, was cast into prison, and mulcted in 200,000 pieces of gold; his two sons were deprived of their governments of Kairwan and Tangier; and the third son, who governed Spain in his father's absence, was beheaded, and his head sent to Muza. Muza Ibn Noseyr died soon after in the greatest poverty, at Hedjaz, 717 A.D.

MUZIANO, Girolamo, 1528–90; b. Aquafredda, near Brescia, Italy; hence his title, Bressano, or Brescianino. His first instructor was the painter Girolamo Romanino. He afterwards studied at Venice and Rome, and devoted himself to the painting of landscapes. His earliest important painting, "The Resurrection of Lazarus," attracted the attention of Michael Angelo, who was so struck by its bold and accurate design that he took Muziano under his protection and secured for him a large number of commissions. Muziano made a study of mosaics, and vastly improved that branch of art. He founded and richly endowed the famous academy of St. Luke. The most of his pictures are in the churches and palaces of Rome, where he spent the larger part of his life. Among them may be mentioned: "St. Jerome," and a "Descent from the Cross" (Borghese palace); "St. Jerome" (Doria palace); "St. Francis" (Mattei palace); "Resurrection of Lazarus" (Vatican); "St. Matthew and St. Paul" (Ara Coeli); "Annunciation" (St. Urban's); "Nativity of Jesus Christ" (Madonna de' Monti); "St. Nicholas" (St. Louis-des-Français); "Cristo Morto" (Santa Cattarina); "Jesus Christ giving the Keys to St. Peter," and a "Flagellation" (in the sacristy of St. Peter's). His frescos are to be seen in the Vatican, at Foligno, etc. The galleries of Bologna, Dresden, Reims, and the Louvre possess specimens of Muziano's work. His designs in India ink are highly prized. He is distinguished for his excellence in design and coloring; for the nobility of his conceptions, and the characteristic expression of his faces. His frescos are sometimes rather sharp and hard in outline and color. Died in Rome, honored as one of the greatest painters in the school of Michael Angelo.

MUZZEY, Artemas Bowers, b. Mass., 1802; educated at Harvard college and the Harvard divinity school. He was settled over the Unitarian church in Framingham in 1830, and was afterwards minister of Unitarian churches in Cambridgeport, Cambridge, and Concord, N. H. His last charge was at Newburyport, Mass., where he remained till 1865, when he retired from the pulpit. Among his numerous works, aside from sermons and tracts, may be mentioned: *The Young Man's Friend*, 1836; *The Young Maiden*, 1840, which had a great success; *Man a Soul*, 1842; *The Sabbath-School Hymn and Tune Book*, 1855; *The Blade and the Ear*, 1864; and *The Higher Education*, 1871. He d. in 1892.

MYACITES, a genus of extinct lamellibranchiate mollusks, belonging to the family *anatinidæ*. They commenced their existence in the Silurian formation, and extended through the triassic and Jurassic into the cretaceous, where they became extinct. They had a gaping ventricose shell, with an external ligament.

MYCALE, the ancient name of a mountain now called Samsun, in the s. of Ionia in Asia Minor. It terminates in the promontory cape Santa Maria, opposite the island of Samos. The strait between the island and the promontory is where the great naval victory of the Greeks over the Persians took place 479 B.C.

MYCE'LIUM, in botany, a development of vegetable life peculiar to *fungi*, but apparently common to all the species of that order. The *spawn* of mushrooms is the mycelium. The mycelium appears to be a provision for the propagation of the plant where its spores may not reach, its extension in the soil or matrix in which it exists, and its preservation when circumstances are unfavorable to its further development. It consists of elongated filaments, simple or jointed, situated either within the matrix or upon its surface. It is often membranous or pulpy. The development of the fungus in its proper form seems to be ready to take place, in proper circumstances, from any part of the mycelium. Fungi often remain long in the state of mycelium, and many kinds of mycelium have been described as distinct species and formed into genera. Fries has rendered great service to botany in investigating these spurious species and genera, and determining their true nature. Liquors in which the flocculent mycelius of a fungus is spreading are said to be *mothery*.

MYCE'NÆ, a very ancient city in the north-eastern part of Argolis, in the Peloponnesus, built upon a craggy height, is said to have been founded by Perseus. It was the capital of Agamemnon's kingdom, and was at that time the principal city in Greece. About 468 B.C., it was destroyed by the inhabitants of Argos, and never rose again from its ruins to anything like its former prosperity. In Strabo's time its ruins only remained; these are still to be seen in the neighborhood of Kharvati, and are specimens of Cyclopean architecture. The most celebrated is the "Gate of Lions," the chief entrance to the ancient Acropolis. Excavations prosecuted at Mycenæ by Dr. Henry Schliemann brought to light in 1876 several ancient tombs, containing a large quantity of gold and silver ornaments, etc. See illus., Architecture, vol. I.

MYCETES, a genus of South American monkeys. See Howler.

MYELI'TIS (*myelos*, marrow), is the term employed to signify inflammation of the substance of the spinal cord. It may be either acute or chronic, but the latter is by far the

most common affection. The *chronic* form begins with a little uneasiness in the spine, somewhat disordered sensations in the extremities, and unusual fatigue after any slight exertion. After a short time paralytic symptoms appear, and slowly increase. The gait becomes uncertain and tottering, and at length the limbs fail to support the body. The paralysis finally attacks the bladder and rectum, and the evacuations are discharged involuntarily; and death takes place as the result of exhaustion, or occasionally of asphyxia if the paralysis involves the chest. In the *acute* form there is much pain (especially in the spinal region), which usually ceases when paralysis supervenes. The other symptoms are the same as those of the chronic form, but they occur more rapidly and with greater severity, and death sometimes takes place in a few days.

The most common causes of this disease are falls, blows, and strains from over-exertion; but sexual abuses and intemperate habits occasionally induce it. It may also result from other diseases of the spine (as caries), or may be propagated from inflammation of the corresponding tissue of the brain.

The treatment, which is much the same as that of inflammation elsewhere, must be confided entirely to the medical practitioner; and it is therefore unnecessary to enter into any details regarding it. When confirmed paralysis has set in, there is little to hope for, but in the early stage the disease is often checked by judicious remedies.

MYENSK, or MJENSK. See MINSK.

MYER, ALBERT JAMES, 1827–80, b. N. Y.; son of a jeweler who established himself in that business in Buffalo, N. Y., while Albert was a child. He graduated at Hobart college, Geneva, N. Y., in 1847; and, returning to Buffalo, began the study of medicine with Dr. Frank H. Hamilton, and took his degree of M.D., at the university of Buffalo in 1851. In 1854 he was appointed assistant surgeon in the U. S. army, and assigned to Texas, where he first developed his now celebrated signal system, and which was adopted by the secretary of war for the use of the army. From 1858 to '60 Myer was a signal officer with the rank of major. On the outbreak of the war he was made signal officer on the staff of Gen. Butler, and afterwards on that of Gen. McClellan, and was successively brevetted lieut.col., col., and brig.gen.; his last promotion being for "distinguished services in organizing, instructing, and commanding the signal corps of the army, and for especial service on Oct. 5, 1864, at Allatoona, Ga.;" on July 28, 1866, he was made colonel in the regular army and chief signal officer. In 1870 he commenced his work of observing and giving notice by telegraph of the approach and force of storms on the northern lakes and sea-coast, at the military post in the interior, and at other points in the states and territories. He organized the meteorological division of the signal service, and in 1873, by special act of congress, was placed in charge of the telegraphic duties in this connection, and authorized to establish signal stations at lighthouses and live-saving stations. In the same year he was a delegate to the meteorological congress held in Vienna. Gen. Myer published *A Manual of Signals for the United States Army.* On the last day of the last session of Congress before his death he received his promotion to the full rank of brig.gen. of the U. S. army. On account of the publication in the leading newspapers, of the daily telegraphic prognostications of the weather-bureau, under the head of "probabilities;" Gen. Myer was familiarly and playfully known by the name "Old Probabilities."

MYERS, PETER HAMILTON, b. N. Y., 1812; educated himself, studied law and pursued its practice in Brooklyn, N. Y.; made his first appearance as an author in 1841, when he wrote a poem on *Science* which he read at the meeting of a society at Hobart college. In 1848 he published *The First of the Knickerbockers, a Tale of 1673.* He afterward wrote a number of novels, among which are *The Young Patroon* (1848); *The King of the Hurons;* and *The Prisoner of the Border* (1857). He published also a book of poems called *Ensinore, a Romance of Owasco Lake.* He d. in 1878.

MY'GALE, a genus of spiders, the type of a family *Mygalidæ.* They have four pulmonary sacs and spiracles, four spinnerets, eight eyes, and hairy legs. They make silken nests in clefts of trees, rocks, etc., or in the ground, sometimes burrowing to a great depth, and very tortuously. To this genus belongs the bird-catching spider (q.v.) of Surinam; but it seems now to be ascertained that several of the larger species frequently prey on small vertebrate animals. They do not take their prey by means of webs, but hunt for it and pounce upon it by surprise. They construct a silken dwelling for themselves in some sheltered retreat. Some of them make a curious lid to their nest or burrow. They envelop their eggs, which are numerous, in a kind of cocoon.

MYLA'BRIS, a genus of coleopterous insects, nearly allied to *Cantharis* (q.v.), and deserving of notice because of the use made of some of the species as blistering flies. *M. cichorii* is thus used in China and India; and *M. Fuesselini,* a native of the south of Europe, is supposed to have been the blistering fly of the ancients.

MYLI'TTA (? corresponding to Heb. *Meyaledeth,* Genitrix, who causes to bear), a female deity, apparently first worshiped among the Babylonians, who gradually spread her worship through Assyria and Persia. She is originally, like almost every other mythological deity, a cosmic symbol, and represents the female portion of the twofold principles through which all creation burst into existence, and which alone, by its united active and passive powers, upholds it. Mylitta is to a certain degree the representative

of earth, the mother, who conceives from the sun, Bel or Baal. Mylitta and Baal together are considered the type of the "Good." Procreation thus being the basis of Mylitta's office in nature, the act itself became a kind of worship to Mylitta, and was hallowed through and for her. Thus it came to pass, that every Babylonian woman had once in her life to give herself up to a stranger, and thereby considered her person consecrated to the great goddess. The sacrifice itself seems, especially in the early stage of its introduction among the divine rites of the primitive Babylonians, to have had much less of the repulsiveness, which, in the eyes of highly cultivated nations, must be attached to it; and it was only in later days that it gave rise to the proverbial Babylonian lewdness. Herodotus's account of this subject must, like almost all his other stories, be received with great caution.

MYLIOBATIDÆ. See RAY.

MY'LODON (Gr. grinder-teeth), a genus of huge fossil sloths, whose remains are found in the Pleistocene deposits of South America, associated with the *Megatherium* and other allied genera. A complete skeleton, dug up at Buenos Ayres, measured 11 ft. from the fore part of the skull to the end of the tail.

MY'NIAS, more accurately MINYAS, was, in Greek mythology, the son of Chryses. He was king of Jolcos, and gave his name to the people called *Minyæ*. He built the city of Orchomenus, where rites (named after him) were selected in his honor. His three daughters, Clymene, Iris, and Alcithoë, according to Ovid, but Leuconoë, Leucippe, and Alcithoë according to other authors, were changed into bats for having contemned the mysteries of Bacchus.

MYOPIA. Also called *brachymetropia* and short sight, is a defect of vision due to the fact that the images are formed before the retina. It is a common symptom of several eye diseases, and is often accompanied by aching and watering of the eyes and divergent squint. Its causes are (1) elongation of the posterior part of the eye; (2) increased curvature of the cornea; (3) retraction of the muscles of the eye; (4) flattening of the eye; (5) luxation of the crystalline humor; (6) staphyloma pellucid of the cornea; (7) tetanic state of the ciliary muscle; but the last four are exceptional. It is generally regarded as hereditary, but not congenital, and is not invariably developed even in individuals predisposed to it. It is always aggravated, and may be produced, where there is no predisposition, by the habitual accommodation of the sight to a short distance, especially if the light is bad and the work is fine, or done in a stooping position. In many cases where it is acquired, it might be avoided by a proper knowledge of and application of the hygiene of the eye. In hereditary cases it becomes noticeable at about seven years of age and it seldom increases after twenty-five.

Researches made by the physicians of all countries show myopia to be increasing, and also that study in school is highly favorable to its development among the young. Poor lighting, fine and bad print, long sessions, and cramped and stooping positions, go far toward explaining the reason for the latter fact. The prevalence of it in France and Germany has caused those nations considerable alarm. According to M. Maurice Perrin, from one-tenth to one-eighth of the effective force of the French Army are disabled by it for many kinds of service, and in Germany, according to Dr. Cohn, seventeen out of every hundred school children, on an average, have defective sight. Dr. Fuchs has shown further that it is much more prevalent in the German city schools than in the village schools, and that it increases steadily from grade to grade and from class to class, until in the gymnasia of the universities it mounts as high as 59%. Formerly there were much fewer near-sighted women than men, but now the proportion is about the same, the increase in school privileges for the former having brought with it an increased amount of myopia.

Jules Guérin has shown that when it is caused by a retraction of the muscles of the eye, myotomy is an efficacious remedy, but with that exception there can be said to be no cure. Eye-glasses with concave lenses act as a palliative, by temporarily correcting the near sight—that is, making the abnormal eye normal.

MYOSO'TIS. See FORGET-ME-NOT.

MYOX'IDÆ, a family of rodents commonly known as dormice. From their resemblance to many of the squirrels and marmots they have sometimes been placed in the family *sciuridæ*. The common dormouse, *myaxus avillanarius*, is a well-known hibernating British species. The family are confined to the old world, and contain about 12 species. They have 4 rooted molars on each side of the jaw, a rudimentary thumb, and are destitute of a *cæcum*. See RODENTIA.

MYR'CIA, a genus of trees of the natural order *Myrtaceæ*, to which belongs the Wild Clove or Wild Cinnamon of the West Indies (*myrtaceæ acris*), a handsome tree of 20 or 30 feet high. Its timber is very hard, red and heavy.

MYR'IAGRAM. See METRIC SYSTEM.

MYRIAM'ETER. See METRIC SYSTEM.

MYRIA'PODA (Gr. myriad-footed), a class of *Arthropoda*, resembling *Annelida* in their lengthened form, and in the great number of equal, or nearly equal, segments of which the body is composed; but in most of their other characters more nearly agreeing with insects, among which they were ranked by the earlier naturalists, and still are by

some. They have a distinct head, but there is no distinction of the other segments, as in insects, into thorax and abdomen. They have simple or compound eyes; a few are destitute of eyes. They have antennæ like those of insects. The mouth is furnished with a complex masticating apparatus, in some resembling that of some insects in a larval state, in others, similar to that of crustaceans. Respiration is carried on through minute pores or spiracles, placed on each side along the entire length of the body, the air being distributed by innumerable ramifying air-tubes to all parts. In most parts of their internal organization the myriapoda resemble insects; although a decided inferiority is exhibited, particularly in the less perfect concentration of the nervous system. The resemblance is greater to insects in their larval than in their perfect state. The body of the myriapoda is protected by a hard *chitinous* covering. The number of segments is various, seldom fewer than 24; although in some of the higher genera they are consolidated together in pairs, so that each pair, unless closely examined, might be considered as one segment bearing two pairs of feet. The legs of some of the lower kinds, as *Julus* (q.v.) are very numerous, and may be regarded as intermediate between the bristle-like appendages which serve many annelids as organs of locomotion, and the distinctly articulated legs of insects. In the higher myriapoda, as *Scolopendra*, the legs are much fewer, and articulated like those of insects. None of the myriapoda have wings. Some of them feed on decaying organic matter, chiefly vegetable; those of higher organization are carnivorous. The myriapoda do not undergo changes so great as those of insects, but emerge from the egg more similar to what they are ultimately to become; although some of them are at first quite destitute of feet; and, contrary to what takes place in insects, the body becomes more elongated as maturity is approached, the number of segments and of feet increasing.

The myriapoda are divided into two orders: the lower, *Chilognatha* (*Julus*, etc.), having the body sub-cylindrical, the feet very numerous, the head rounded, the mandibles thick and strong; the higher *Chilopoda* (*Scolopendra*, etc.), having the body flattened, the feet comparatively few, the head broad, the mandibles sharp and curved.

MYRI'CA. See CANDLEBERRY.

MYRISTICACEÆ. See NUTMEG.

MYRIS'TIC ACID, $C_{13}H_{27}\cdot COOH$, is a crystalline fatty acid, found in the seeds of the common nutmeg, *Myristica moschata*. It occurs in the form of a glyceride in the fat of the nutmeg, or nutmeg butter. It has recently been found in small quantity amongst the products of the saponification of spermaceti, and of the fatty matter of milk; and hence this organic acid must be ranked amongst those which are common both to the animal and vegetable kingdoms.

MYRMECO'BIUS, the banded ant-eater of Australia. See MARSUPIALIA.

MYRMECO'PHAGA. See ANT-EATER.

MYRME'LEON. See ANT LION.

MYRMID'ONES, an ancient people in Pthiotis, in s. Thessaly. According to the legends, they were so called from Myrmidon, a son of Jupiter, and son-in-law of Æolus. Myrmidon's son, Actor, married Ægina, daughter of Asopus. Another story says they came from Ægina, and were ants (myrmêkes), changed by Jupiter into men. They settled in Thessaly with Peleus, with whose son Achilles, they went to the Trojan war. The name has come to denote, in English, a troop or great horde of ruffians devoted to a single leader.

MYRO'BALANS, the astringent fruit of certain species of *Terminalia*, of the natural order *Combretaceæ*, natives of the mountains of India. The genus *Terminalia* has a deciduous bell-shaped calyx and no corolla; the fruit is a juiceless drupe. *T. Belerica*, a species with alternate eliptical entire leaves, on long stalks, produces great part of the myrobalans of commerce; but the fruits of other species often appear under the same name. Tonic properties are ascribed to myrobalans; but although once in great repute, they are now scarcely used in medicine. They are used, however, by tanners and by dyers, and have therefore become a very considerable article of importation from India. They give a durable yellow color with alum, and, with the addition of iron, an excellent black. See PLUM.

MY'RON, about B.C. 480–430; native of Bœotia; Athenian sculptor and engraver of wood and silver; studied under Agelidas at Argos. His first great production was the statue of a cow, so wonderfully life-like that it was mistaken for the real animal by cattle. Myron, as Pliny observes, excelled not in expression but in realistic imitation of men and animals. Perhaps his most noted work was the "Discobolus," or quoit-thrower. The bronze image of the cow stood in Athens for many centuries, and was then taken to Rome, where it was known to be as late as the sixth century. Several statues were discovered in the last century, which it was claimed were the work of Myron, and one or two are almost certainly original. The British Museum has an ancient marble copy of the "Discobolus."

MYRRH (Heb. *mur*), a gum produced by *balsamodendron* (q.v.) *myrrha*, a tree of the natural order *amyridaceæ*, growing in Arabia, and probably also in Abyssinia. The myrrh tree is small and scrubby, spiny, with whitish-gray bark, thinly-scattered small leaves, consisting of three obovate obtusely toothletted leaflets, and the fruit a smooth

brown ovate drupe, somewhat larger than a pea. Myrrh exudes from the bark in oily yellowish drops, which gradually thicken and finally become hard, the color at the same time becoming darker. Myrrh has been known and valued from the most ancient times; it is mentioned as an article of commerce in Gen. xxxvii. 25, and was amongst the presents which Jacob sent to the Egyptian ruler, and amongst those which the wise men from the east brought to the infant Jesus. It was an ingredient in the "holy anointing oil" of the Jews. Myrrh appears in commerce either in tears and grains, or in pieces of irregular form and various sizes, yellow, red, or reddish brown. It is brittle, and has a waxy fracture, often exhibiting whitish veins. Its smell is balsamic, its taste aromatic and bitter. It is used in medicine as a tonic and stimulant, in disorders of the digestive organs, excessive secretions from the mucous membranes, etc., also to cleanse foul ulcers and promote their healing, and as a dentifrice, particularly in a spongy or ulcerated condition of the gums. It was much used by the ancient Egyptians in embalming. The best myrrh is known in commerce as *Turkey myrrh*, being brought from Turkish ports; as the name *East Indian myrrh* is also given to myrrh brought to Europe from the East Indies, although it is not produced there, but comes from Abyssinia. It is not yet certainly known whether the myrrh tree of Abyssinia is the same as that of Arabia, or an allied species.

MYRTA'CEÆ, a natural order of exogenous plants, consisting of trees and shrubs, natives chiefly of warm, but partly also of temperate countries. The order, as defined by the greater number of botanists, includes several suborders, which are regarded by some as distinct orders, particularly CHAMÆLAUCIACEÆ (in which are contained about 50 known species, mostly beautiful little bushes, often with fragrant leaves, natives of New Holland), Barringtoniaceæ (q.v.), and Lecythidaceæ (q.v.). Even as restricted, by the separation of these, the order contains about 1300 known species. The leaves are entire, usually with pelucid dots, and a vein running parallel to and near their margin.—Some of the species are gigantic trees, as the *eucalypti* or *gum tree* of New Holland, and different species of *metrosideros*, of which one is found as far s. as Lord Auckland's islands, in lat. 50½°. The timber is generally compact.—Astringency seems to be rather a prevalent property in the order, and the leaves or other parts of some species are used in medicine as astringents and tonics. A fragrant or pungent volatile oil is often present in considerable quantity, of which *oil of cajeput* and *oil of cloves* are examples. *Cloves* and *pimento* are amongst the best known products of this order. The berries of several species are occasionally used as spices in the same way as the true pimento. A considerable number yield pleasant edible fruits, among which are the POMEGRANATE, the GUAVA, species of the genus *Eugenia*, and some species of myrtle.

MYRTLE, *Myrtus*, a genus of *myrtaceæ*, having the limb of the calyx 4 to 5 parted, 4 to 5 petals, numerous free stamens, an almost globose germen, and a 2 to 3 celled berry, crowned with the limb of the calyx, and containing kidney shaped seeds. The leaves are opposite and marked with pelucid dots; the flower-stalks are axillary, and generally one-flowered. The COMMON MYRTLE (*M. communis*) is well known as a beautiful evergreen shrub, or a tree of moderate size, with white flowers. It is a native of all the countries around the Mediterranean sea, and of the temperate parts of Asia, often forming thickets, which sometimes occur even within the reach of the sea-spray. The leaves are ovate or lanceolate, varying much in breadth. They are astringent and aromatic, containing a volatile oil, and were used in medicine by the ancients as a stimulant. The berries are also aromatic, and are used in medicine in Greece and India. A myrtle wine, called *myrtidanum*, is made in Tuscany. Myrtle bark is used for tanning in many parts of the south of Europe. Among the ancient Greeks the myrtle was sacred to Venus, as the symbol of youth and beauty, was much used in festivals, and was, as it still is, often mentioned in poetry. The myrtle endures the winters of Britain only in the mildest situations in the south.—The SMALL-LEAVED MYRTLE of Peru (*M. microphylla*) has red berries of the size of a pea, of a pleasant flavor and sugary sweetness. Those of the LUMA (*M. luma*) are also palatable, and are eaten in Chili; as are those of the DOWNY MYRTLE (*M. tomentosa*), on the Neilgherry hill; and those of the WHITE-BERRIED MYRTLE (*M. leucocarpa*), by some regarded as a variety of the common myrtle, in Greece and Syria. The berries of this species or variety are larger than those of the common myrtle, and have a very pleasant taste and smell.—A very humble species of myrtle (*M. nummularia*) spreads over the ground in the Falkland islands, as thyme does in Britain.

MYRTLE-WAX. See WAX.

MY'SIA, in ancient geography, a province in n.w. Asia Minor, joining Lydia on the s. and Bithynia on the e., and bounded w. by the Hellespont and n. by the Propontis; the principal rivers were the Caicus, Æsepus, and Rhyndacus; the surface is mountainous in the interior, and in part table-land. The inhabitants were thought by some ancient writers to be of Thracian, and by others of Lydian descent; probably there were immigrations from both countries. Homer mentions the Mysi, but does not define their country. Mysia was subject to the Lydian monarchy, and under the Persian dominion formed, together with Lydia, one of the satrapies created by Darius. After the death of Alexander the Great, it passed from Macedonian to Syrian rule, was then given to the kings of Pergamus by Rome, and afterwards made a Roman province. Its principal towns were Abydos, Cyzicus, and Pergamus.

MY'SIS, a genus of podophthalmous (stalk-eyed) crustaceans, of the order *stomapoda,* much resembling the common shrimps in form, although differing from them in the external position of the gills. They are often called *opposum shrimps,* because the last two feet are furnished with an appendage, which in the female forms a large pouch, and in this the eggs are received after they leave the ovary, and are retained till the young acquire a form very similar to that of the parent, when the whole brood are at once set free into the ocean. Species of mysis are found on the British shores, but they are far more abundant in the Arctic seas, where they form no small part of the food of whales, and of many fishes, particularly of different species of salmon.

MYSORE', or MAISUR, a large native state of southern India, more or less under the control of the British government, in lat. 11° 38′, to 15° n., and in long. 74° 42′ to 78° 36′ e. It is bounded on the n. by the British collectorate of Dharwar, and otherwise surrounded by districts belonging to the Madras presidency. The area is 27,936 sq. m.: the population in 1881–82 was 4,186,199, and in 1891 was 4,943,604. Mysore is an extensive table-land, with an average elevation of about 2,000 ft., and with a slope principally towards the n. and n.e. The chief rivers are the Cauvery, flowing s.e., and the Tungabhadro, the Hugri, and the Pennar, flowing n. and n.e. The climate of the higher districts is during a great portion of the year healthy and pleasant. Grain and oil seeds form the major part of the crops. The betel-nut and cocoanut palm are important. Coffee is grown in large quantities. There are a number of gold mines in the e. part of the state. Since 1832 the control of the country has been somewhat in the hands of the English, and the government is administered by a British commissioner. Chief town, Mysore. For the history of Mysore, see articles HYDER ALI, TIPPOO SAHIB, and INDIA.

MYSORE, or MAISUR, a city of India, the seat of a British residency, capital of the territory, and of the subdivision of the same name, is situated amid picturesque scenery on a declivity formed by two parallel ranges of elevated ground running n. and s., 245 m. w.s.w. of Madras, lat. 12° 18′ n., long. 76° 42′ east. The houses are generally built of teak, and among the chief edifices are the British residency and church. The fort is quadrangular in form, three of its sides being 450 yards in length, and the remaining side longer. The rajah's palace, occupying three sides of the interior fort, contains a magnificent chair or throne of gold. The climate is mild, but not healthy; fevers are of frequent occurrence. Carpets are manufactured. Pop. '91, 74,048.

MYS'TAGOGUE (Gr. *mustes,* an initiated person, and *ago,* I lead), the name in the Greek religious system of the priest whose duty it was to direct the preparations of the candidates for initiation in the several mysteries, as well as to conduct the ceremonial of initiation. It was sometimes applied by a sort of analogy to the class of professional *ciceroni,* who in ancient, as still in modern times, undertook to show strangers newly arrived in a city the noteworthy objects which it contained; but the former meaning is its primitive one, and formed the ground of the application of the same name in the Christian church, to the catechists or other clergy who prepared candidates for the Christian *mysteries,* or sacraments, of baptism, of confirmation, and the eucharist, especially the last. In this sense the word is constantly used by the fathers of the 4th and 5th centuries; and in the well-known lectures of St. Cyril of Jerusalem, although all were addressed to candidates for the mysteries, some for baptism, and some for the eucharist, it is only the lectures addressed to the latter that the name *mystagogic* is applied. This distinction was connected with the well-known Discipline of the Secret; and it appears to have ceased with the abolition or gradual disuse of that discipline.

MYSTERIES (Gr. from *muo,* to close the lips or eyes), also called *Teletai, Orgia,* or, in Latin, *Initia,* designate certain rites and ceremonies in ancient, chiefly Greek and Roman, religions, only known to, and practiced by, congregations of certain initiated men and women, at appointed seasons, and in strict seclusion. The origin, as well as the real purport of these mysteries, which take no unimportant place among the religious festivals of the classical period, and which, in their ever-changing nature, designate various places of religious development in the antique world, is all but unknown. It does seem, indeed, as if the vague speculations of modern times on the subject were an echo of the manifold interpretations of the various acts of the mysteries given by the priests to the inquiring disciple—according to the lights of the former or the latter. Some investigators, themselves not entirely free from certain mystic influences (like Creuzer and others), have held them to have been a kind of misty orb around a kernel of pure light, the bright rays of which were too strong for the eyes of the multitude; that, in fact, they hid, under an outward garb of mummery, a certain portion of the real and eternal truth of religion, the knowledge of which had been derived from some primeval, or, perhaps, the Mosaic revelation; if it could not be traced to certain (or uncertain) Egyptian, Indian, or generally eastern sources. To this kind of hazy talk, however (which we only mention because it is still repeated every now and then), the real and thorough investigations begun by Lobeck, and still pursued by many competent scholars in our own day, have, or ought to have, put an end. There cannot be anything more alien to the whole spirit of Greek and Roman antiquity than a hiding of abstract truths and occult wisdom under rights and formulas, songs and dances; and, in fact, the mysteries were anything but exclusive, either with respect to sex, age, or rank, in point of initiation. It was only the speculative tendency of later times, when Poly

theism was on the wane, that tried to symbolize and allegorize these obscure, and partly imported ceremonies, the bulk of which had undoubtedly sprung from the midst of the Pelasgian tribes themselves in prehistoric times, and which were intended to represent and to celebrate certain natural phenomena in the visible creation. There is certainly no reason to deny that some more refined minds may, at a very early period, have endeavored to impart a higher sense to these wondrous performances; but these can only be considered as solitary instances. The very fact of their having to be put down in later days as public nuisances in Rome herself, speaks volumes against the occult wisdom inculcated in secret assemblies of men and women.

The mysteries, as such, consisted of purifications, sacrificial offerings, processions, songs, dances, dramatic performances, and the like. The mystic formulas (*Deiknumena, Dromena, Legomena,* the latter including the Liturgies, etc.) were held deep secrets, and could only be communicated to those who had passed the last stage of preparation in the mystagogue's hand. The hold which the nightly secrecy of these meetings, together with their extraordinary worship, must naturally have taken upon minds more fresh and childlike than our advanced ages can boast of, was increased by all the mechanical contrivances of the effects of light and sound which the priests could command. Mysterious voices were heard singing, whispering, and sighing all around, lights gleamed in manifold colors from above and below, figures appeared and disappeared; the mimic, the tonic, the plastic—all the arts, in fact, were taxed to their very utmost to make these performances (the nearest approach to which, in this country, is furnished by transformation-scenes, or sensation-dramas in general) as attractive and profitable (to the priests) as could be. As far as we have any knowledge of the plots of these mysteries as scenic representations, they generally brought the stories of the special gods or goddesses before the spectator—their births, sufferings, deaths, and resurrections. Many were the outward symbols used, of which such as the Phallus, the Thyrsus, flower baskets, mystic boxes, in connection with special deities, told, more or less, their own tale, although the meanings supplied by later ages, from the Neo-platonists to our own day, are various, and often very amazing. The most important mysteries were, in historical times, those of Eleusis and the Thesmophorian, both representing—each from a different point of view—the rape of Proserpina, and Cere's search for her: the Thesmophorian mysteries being also in a manner connected with the Dionysian worship. There were further, those of Zeus of Crete—derived from a very remote period—of Bacchus himself, of Cybele, and Aphrodite—the two latter with reference to the mystery of propagation, but celebrated in diametrically opposed ways, the former culminating in the self-mutilation of the worshiper, the latter in prostitution. Further, the mysteries of Orpheus, who, in a certain degree, was considered the founder of all mysteries. Nor were the other gods and goddesses forgotten: Hera, Minerva, Diana, Hecate, nay, foreign gods like Mithras (q.v.), and the like, had their due secret solemnities all over the classical soil, and whithersoever Greek (and partly Roman) colonists took their Lares and Penates all over the antique world. The beginning of the reaction in the minds of thinking men, against this mostly gross and degenerated kind of veneration of natural powers and instincts, is marked by the period of the Hesiodic poems; and when, toward the end of the classical periods, the mysteries were no longer secret, but public orgies of the most shameless kind, their days were numbered. The most subtle metaphysicians, allegorize and symbolize as they might, failed in reviving them, and in restoring them to whatever primeval dignity there might have once been inherent in them.

MYSTERIES AND **MIRACLE-PLAYS** were dramas founded on the historical parts of the Old and New Testaments, and the lives of the saints, performed during the middle ages, first in churches, and afterwards in the streets on fixed or movable stages. Mysteries were properly taken from biblical and miracle-plays from legendary subjects, but this distinction in nomenclature was not always strictly adhered to. We have an extant specimen of the religious play of a date prior to the beginning of the middle ages in the *Christos Paschōn*, assigned, somewhat questionably, to Gregory Nazianzen, and written in 4th c. Greek. Next comes six Latin plays on subjects connected with the lives of the saints, by Roswitha, a nun of Gandersheim, in Saxony, which, though not very artistically constructed, possesses considerable dramatic power and interest; they have been lately published at Paris, with a French translation. The performers were at first the clergy and choristers, afterwards any layman might participate. The earliest recorded performance of a miracle-play took place in England. Matthew Paris relates that Geoffroy, afterwards abbot of St. Albans, while a secular, exhibited at Dunstable the miracle-play of *St. Catherine*, and borrowed copes from St. Albans to dress his characters. This must have been at the end of the 11th or beginning of the 12th century. Fitzstephen, in his *Life of Thomas à Becket*, 1183 A.D., describes with approval the representation in London of the sufferings of the saints and miracles of the confessors. On the establishment of the Corpus Christi festival by Pope Urban IV. in 1264, miracle-plays became one of its adjuncts, and every considerable town had a fraternity for their performance. Throughout the 15th and following centuries, they continued in full force in England, and are mentioned, sometimes approvingly, sometimes disapprovingly, by contemporary writers. Designed at first as a means of religious instruction for the people, they had long before the reformation so far departed from their original character, as to

be mixed up in many instances with buffoonery and irreverence, intentional or unintentional, and to be the means of inducing contempt rather than respect for the church and religion. Remarkable collections exist of English mysteries and miracles of the 15th c., known as the Chester, the Coventry, and the Townley plays. The first two have been published by the Shakespeare Society, and the other by the Surtees Society. The Townley mysteries are full of the burlesque element, and contain many curious illustrations of contemporary manners.

Out of the mysteries and miracle-plays sprang a third class of religious plays called *Moralities*, in which allegorical personification of the Virtues and Vices were introduced as *dramatis personæ*. These personages at first only took part in the play along with the scriptural or legendary characters, but afterwards entirely superseded them. The oldest known English compositions of this kind are of the time of Henry VI.; they are mere elaborate and less interesting than the miracle-plays. Moralities continued in fashion till the time of Elizabeth, and were the immediate precursors of the regular drama.

Miracles and mysteries were as popoular in France, Germany, Spain, and Italy as in England. A piece of the kind yet extant, composed in France in the 11th c., is entitled the *Mystery of the Wise and Foolish Virgins*, and written partly in the Provençal dialect and partly in Latin. A celebrated fraternity, called the Confrérie de la Passion, founded in Paris in 1350, had a monopoly for the performance of mysteries and miracle-plays, which were of such a length, that the exhibition of each occupied several days. A large number of French mysteries of the the 14th c. are extant. In the alpine districts of Germany, miracle-plays were composed and acted by the peasants; these peasant-plays had less regularity in their dramatic form, were often interspersed with songs and processions; and in their union of simplicity with high-wrought feeling were most characteristic of a people in whom the religious and dramatic element are both so largely developed. In the early part of the last century, they began to partake to a limited extent of the burlesque, which had brought the miracle-plays into disrepute elsewhere.

It is a mistake to suppose that the hostility of the reformers was what suppressed these exhibitions. The fathers of the reformation showed no unfriendly feeling towards them. Luther is reported to have said that they often did more good and produced more impression than sermons. The most direct encouragement was given to them by the founders of the Swedish Protestant Church, and by the earlier Lutheran bishops, Swedish and Danish. The authorship of one drama of the kind is assigned to Grotius. In England the greatest check they received was from the rise of the secular drama; yet they continued to be occasionally performed in the times of James I. and Charles I., and it is well known that the first sketch of Milton's *Paradise Lost* was a sacred drama, where the opening speech was Satan's Address to the Sun. A degenerate relic of the miracle-play may yet be traced in some remote districts of England, where the story of St. George, the dragon, and Beelzebub, is rudely represented by the peasantry. Strange to say, it was in the Catholic south of Germany, where these miracle-plays and mysteries had preserved most of their old religious character, that the severest blow was levelled against them. Even there, they had begun to be tainted to a limited extent with the burlesque element, which had brought them into disrepute elsewhere. In 1779 a manifesto was issued by the prince-archbishop of Salzburg, condemning them, and prohibiting their performance, on the ground of their ludicrous mixture of the sacred and the profane, the frequent bad acting in the serious parts, the distraction of the lower orders from more edifying modes of instruction, and the scandal arising from the exposure of sacred subjects to the ridicule of freethinkers. This ecclesiastical denunciation was followed by vigorous measures on the part of the civil authorities in Austria and Bavaria. One exception was made to the general suppression. In 1633 the villagers of Oberammergau, in the Bavarian highlands, on the cessation of a plague which desolated the surrounding country, had vowed to perform every tenth year the Passion of Our Savior, out of gratitude, and as a means of religious instruction; a vow which had ever since been regularly observed. The pleading of a deputation of Ammergau peasants with Max. Joseph of Bavaria saved their mystery from the general condemnation, on condition of everything that could offend good taste being expunged. It was then and afterwards somewhat remodelled, and is perhaps the only mystery or miracle-play which has survived to the present day. The last performance took place in 1890. The inhabitants of this secluded village, long noted for their skill in carving in wood and ivory, have a rare union of artistic cultivation with perfect simplicity. Their familiarity with sacred subjects is even beyond what is usual in the alpine part of Germany, and the spectacle seems still to be looked on with feelings much like those with which it was originally conceived. What would elsewhere appear impious, is to the alpine peasants devout and edifying. The personator of Christ considers his part an act of religious worship; he and the other principal performers are said to be selected for their holy life, and consecrated to their work with prayer. The players, about 500 in number, are exclusively the villagers, who, though they have no artistic instruction, except from the parish priest, act their parts with no little dramatic power, and a delicate appreciation of character. The New Testament narrative is strictly adhered to, the only legendary addition to it being the St. Veronica handkerchief. The acts alternate with *tableaux* from the Old Testament and choral odes. Many thousands of the peasantry are attracted by the spectacle from all parts of the Tyrol and Bavaria, among whom the same earnest and devout demeanor

prevails as among the performers. Plays of a humbler description, from subjects in legendary or sacred history, are not unfrequently got up by the villagers around Innsbruck, which show a certain rude dramatic talent, though not comparable to what is exhibited at Ammergau. Girls very generally represent both the male and female characters. See illus., VIENNA AND AUSTRIA, vol. XV.

MYSTICETE, a name of the whalebone whale, a cetacean of the family *balænidæ,* or toothless whales. See WHALE and CETACEA.

MYS'TICISM (Gr. *mustikos,* mystical), a term used with considerable vagueness, but implying that general tendency in religin to higher and more intimate communication with the divine, to which, in most religions, ancient and modern, certain individuals or classes have laid claim. In the Platonic philosophy, and in the eastern systems, from which that philosophy is derived, the human soul being regarded as a portion of the divine nature, it is held to be the great end of life to free the soul from the embarrassment and mental darkness in which it is held by the material trammels of the body in which it is imprisoned. In the pursuit of this end, two very opposite courses were adopted: the first, that of spiritual purification, partly by representing the natural appetites and weakening the sensual impulses by corporeal austerities, partly by elevating the soul through intense contemplation and withdrawal from the outward objects of sense; the other, that of regarding the soul as superior to the body, independent of its animal impulses, incapable, from its higher origin, of being affected by its outward actions, or sullied by contact with the corruption in which its lower nature might love to wallow. A similar element of mysticism, which, in truth, must form in some sense a constituent of every religious system, is traceable in the early doctrinal history of Christianity, and the career of Christian mysticism also divides itself into the same twofold course. Among the early sects external to the church, we trace the first in the system of Tatian and of the Eucratites, while the second finds its parallel in the Syrian gnostics, in Carpocrates, Bardisanes, and in one form at least of the Nicolaitic heresy. Within the Christian church there never has been wanting a continuous manifestation of the mystical element. The language of St. Paul in Gal. ii. 20, and in 2d Cor. xii. 2, and many expressions in the Apocalypse, may be taken as the exponents of Christian mysticism, the highest aspiration of which has ever been toward that state in which the Christian "no longer liveth, but Christ liveth in him." And although no regular scheme of mysticism can be found in the early fathers, yet the writings of Hermas the shepherd, the epistles of St. Ignatius, the works of St. Clement of Alexandria, the expositions of Origen, and above all, the confessions of St. Augustine, abound with outpourings of the true spirit of Christian mysticism. It is curious that the first systematic exposition of its principles is said to be in the works of the pseudo-Dionysius the Areopagite; but it was not till the days of the Scholastics that it received its first development, when the mystic life was resolved into its three stages, viz., of purification, of illumination, and of ecstatic union with God and absorption in divine contemplation. It was upon the explanation of this third stage that the great division of the medieval mystic schools mainly turned; some of them explaining the union with God in a pantheistic or semi-pantheistic sense, and thereby annihilating the individual will, and almost the personal action of man in the state of ecstasy; others, with St. Bernard, fully preserving both the individuality and the freedom of man, even in the highest spiritual communication with his Creator. Of the former, many, as the Hesychasts (q.v.) in the Greek church, and the brethren of the free-spirit (q.v.) and the Beghards in the Latin, drew from these mystical doctrines the most revolting moral consequences; in others, as Tauler, Ruysbroek, Ekkart, the error does not seem to have gone beyond the sphere of speculation. The writings of Thomas à Kempis (q.v.), of St. Catherine of Siena, of St. John of the cross, and of St. Teresa, may perhaps be taken as the most characteristic representations of the more modern form of the traditionary mysticism which has come down from the mystics of the middle ages.

The later history of mysticism in the Roman Catholic church will be found under the heads of FÉNELON, GUYON (JEANNE), MOLINOS, and QUIETISTS. The most remarkable followers of the same or kindred doctrines in the Protestant communions are Jacob Böhme (q.v.) of Görlith, Emanuel Swedenborg (q.v.), and the celebrated William Law (q.v.).

MYTH and **MYTH'OLOGY.** The word *myth* (Gr. *mythos*) originally signified *speech* or *discourse,* and was identical with the word *logos.* After the age of Pindar and Herodotus, however, it came to be synonymous with the Latin word *fabula, fable* or *legend.* According to the present use of our language, a myth is an idea or fancy presented in the historical form; and though, of course, any fiction at any time in this shape might be called a myth, yet by usage the word is confined to those fictions made in the early periods of a people's existence, for the purpose of presenting their religious belief, and generally their oldest traditions, in an attractive form. The tendency to create myths in this way seems inherent in every people; certainly there is no people so sunk into the brute as to be without them. A myth is not to be confounded with an allegory; the one being an unconscious act of the public mind at an early stage of society, the other a conscious act of the individual mind at any stage of social progress. The parables of the New Testament are allegorical; so are Æsop's fables; no one mistakes them for realities.

they are known to have been invented for a special didactic purpose, and so received. But the peculiarity of myths is, that they are not only conceived in the narrative form, but generally taken for real narrations by the people to whom they belong, so long as they do not pass a certain stage of intellectual culture. Even myths of which the allegorical significance is pretty plain, such as the well-known Greek myth of Promethus and Epimetheus, were received as facts of early tradition by the Greeks. Myths may be divided into several classes, of which the first and most important is the theological and moral. The oldest theology of all nations is in the form of myths; hence the great importance of mythological study, now universally recognized; for it is not occupied merely or mainly with strange fancies and marvelous fictions, invented for the sake of amusement, but contains the fundamental ideas belonging to the moral and religious nature of man as they have been embodied by the imaginative faculty of the most favored races. It is this dominance of the imagination, so characteristic of the early stages of society, which gives to myth its peculiar dramatic expression, and stamps the popular creed of all nations with the character of a poetry of nature, of man, and of God. From the very nature of the case, the myth-producing faculty exercises itself with exuberance only under the polytheistic form of religion; for there only does a sufficient number of celestial personages exist, whose attributes and actions may be exhibited in a narrative form; there is nothing, however, to prevent even a monotheistic people from exhibiting certain great ideas of their faith in a narrative form, so as by prosaic minds to be taken for literal historical facts. But besides strictly theological myths, there are physical myths, that is, fictions representing the most striking appearances and changes of external nature in the form of political history; in which view, the connection of legends about giants, chimeras, etc., with regions marked by peculiar volcanic phenomena, has been often remarked. It is difficult indeed, in polytheistic religion, to draw any strict line between physical and theological myths; as the divinity of all the operations of nature is the first postulate of polytheism, and every physical phenomenon becomes the manifestation of a god. Again, though it may appear a contradiction, there are historical myths, that is, marvelous legends about persons, who may with probability be supposed to have actually existed. So intermingled, indeed, is fact with fable in early times, that there must always be a kind of debatable land between plain theological myth and recognized historical fact. This land is occupied by what are called the heroic myths; that is, legends about heroes, concerning whom it may often be doubtful whether they are merely a sort of inferior, and more human-like gods, or only men of more than ordinary powers whom the popular imagination has elevated into demi-gods.

The scientific study of mythology commenced with the ancient nations who produced it, specially with the acute and speculative Greeks. The great mass of the Greek people, indeed—of whom we have a characteristic type in the traveler Pausanias—accepted their oldest legends, in the mass, as divine and human facts; but so early as the time of Euripides, or even before his day in the case of the Sicilians, Epicharmus and Empedocles, we find that philosophers and poets had begun to identify Jove with the upper sky, Apollo with the sun, Juno with the nether atmosphere, and so forth; that is, they interpreted their mythology as a theology and poetry of nature. This, indeed, may be regarded as the prevalent view among all the more reflective and philosophical heathens (who were not, like Xenophon, orthodox believers) up from the age of Pericles, 450 B.C., to the establishment of Christianity. But there was an altogether opposite view, which arose at a later period, under less genial circumstances, and exercised no small influence both on Greek and Roman writers. This view was first prominently put forth by Euhemerus Messenian, in the time of the first Ptolemies, and consisted in the flat prosaic assertion, that the gods, equally with the heroes, were originally men, and all the tales about them only human facts sublimed and elevated by the imagination of pious devotees. This view seemed to derive strong support from the known stories about the birth and death of the gods, specially of Jove in Crete; and the growing skeptical tendencies of the scientific school at Alexandria, were of course favorable to the promulgation of such views. The work of Euhemerus accordingly obtained a wide circulation; and having been translated into Latin, went to nourish that crass form of religious skepticism which was one of the most notable symptoms of the decline of Roman genius at the time of the emperors. Historians, like Diodorus, gladly adopted an interpretation of the popular mythology which promised to swell their stores of reliable material; the myths accordingly were coolly emptied of the poetic soul which inspired them, and the early traditions of the heroic ages were set forth as plain history, with a grave sobriety equally opposed to sound criticism, natural piety, and good taste.

In modern times, the Greek mythology has again formed the basis of much speculation on the character of myths and the general laws of mythical interpretation. The first tendency of modern Christian scholars, following the track long before taken by the fathers, was to refer all Greek mythology to a corruption of Old Testament doctrine and history. Of this system of interpreting myths, we have examples in Vossius, in the learned and fanciful works of Bryant and Faber, and very recently, though with more pious and poetic feeling, in Gladstone. But the Germans, who have taken the lead here, as in other regions of combined research and speculation, have long ago given up this ground as untenable, and have introduced the rational method of interpreting every system of myths, in the first place, according to the peculiar laws traceable in its own

genius and growth. Ground was broken in this department by Heyne, whose views have been tested, corrected, and enlarged by a great number of learned, ingenious, and philosophical writers among his own countrymen, specially by Buttmann, Voss, Creuzer, Müller, Welcker, Gerhard, and Preller. The general tendency of the Germans is to start—as Wordsworth does in his *Excursion*, book iv.—from the position of a devout imaginative contemplation of nature, in which the myths originated, and to trace the working out of those ideas, in different places and at different times, with the most critical research, and the most vivid reconstruction. If in this work they have given birth to a large mass of ingenious nonsense and brilliant guess-work, there has not been wanting among them abundance of sober judgment and sound sense to counteract such extravagances. It may be noticed, however, as characteristic of their over speculative intellect, that they have a tendency to bring the sway of theological and physical symbols down into a region of what appears to be plain historical fact; so that Achilles becomes a water-god, Peleus a mud-god, and the whole of the *Iliad*, according to Forchhammer, a poetical geology of Thessaly and the Troad! Going to the opposite extreme from Euhemerus, they have denied the existence even of deified heroes; all the heroes of Greek tradition, according to Uschold, are only degraded gods; and generally in German writers, a preference of transcendental to simple and obvious explanations of myths is noticeable. Creuzer, some of whose views had been anticipated by Blackwell, in Scotland, is especially remarkable for the high ground of religious and philosophical conception on which he has placed the interpretation of myths; and he was also the first who directed attention to the oriental element in Greek mythology—not, indeed, with sufficient discrimination in many cases, but to the great enrichment of mythological material, and the enlargement of philosophical survey. In the most recent times, by uniting the excursive method of Creuzer with the correction supplied by the more critical method of O. Müller and his successors, the science of comparative mythology has been launched into existence; and specially the comparison of the earliest Greek mythology with the sacred legends of the Hindus, has been ably advocated by Max Müller in the *Oxford Essays* (1856). In France, the views of Euhemerus were propounded by Banier (1739). By the British scholars, mythology is a field that has been very scantily cultivated. Besides those already named, Payne Knight, Mackay, Grote in the first volumes of his history, and Keightley are the only names of any note, and their works can in nowise compete in originality, extent of research, in discriminating criticism, or in largeness of view, with the productions of the German school. The best for common purposes is Keightley; the most original, Payne Knight. Recently, G. W. Cox, in a work on Aryan mythology, has pushed the sanscritising tendencies of Max Müller to an extreme which to most minds seems absurd. On the special mythologies of India, Rome, Greece, etc., information will be found under the heads of the respective countries to which they belong. The more important mythological personages are noticed under their own names; see Bacchus, Jupiter, Hercules, etc.

MYTHICAL ISLANDS are those mentioned by early writers and navigators, the existence of which is doubtful, since they have never been found in the localities indicated on charts. Nearly all of these were said to be in the Atlantic Ocean, and among them were Atlantis (q.v.); also Bimini, which was said to belong to the Bahama group, but far to the east, and believed by the natives to contain a spring, whose waters would give everlasting youth. See Ponce de Leon. Brazil was, perhaps, the most famous of all these islands on account of its red dyewoods, the name properly denoting *dyewood*. This island was variously located on the charts of the Middle Ages, and on one drawn in 1436, is also named *Terceira*. Isla Verte, or Green Rock, was believed by the natives of the Hebrides to be always visible beneath the setting sun. Borandan or St. Brandon was located on most of the maps of the sixteenth century west of the Canaries, and expeditions were sent in search of it as late as 1721; but as it was never found, it was believed to be inaccessible to mortals by enchantment. It was believed to be the home of Armida (q.v.). The Island of Seven Cities was another of the fabulous islands of the sixteenth century, which was particularly noted for its magnificence and wealth. It was to this island that seven bishops and their followers were said to have fled on the conquest of Spain by the Moors. Arriving here, they burned their ships to prevent the return of any possible deserters, and founded seven cities, and whenever navigators touched upon these shores they were never allowed to leave. Cipango was another island much searched for by Columbus and other early navigators, and supposed by some to be Japan. Gummer's Ore was a fabulous island said to float about in the northern seas, near the southern shores of Norway and Sweden. One navigator placed it on the charts as being just off the coast from Stockholm. Zangbar was a mythical island of India, lying in the Indian Ocean. See also Lemuria. Under this head may also be mentioned the mythical islands of literature, only a few of which can be mentioned. Avalon (q.v.), Islands of the Blessed, in Grecian mythology, were located in the far west, and famous as the abode to which the favorites of the gods were allowed to go without dying. Glubdubdrib, Laputa, and Luggnagg are all islands mentioned by Swift in *Gulliver's Travels*. Island of Lanterns, in a satire by Rabelais, was noted as the abode of false pretenders to knowledge. Barataria is an island-city in Don Quixote over which Sancho Panza ruled for a time. The New Atlantis was an island on

which Bacon represented himself as wrecked, on which he found an association of people for the promotion of science and art.

MYTILE'NE, or MITYLENE, **CITY.** See CASTRO.

MYTILE'NE, or MITYLENE, **ISLAND.** See LESBOS.

MYXINE, a genus of cartilaginous fishes, synonomous with the *gastro-branchus* of Bloch, of which the *myxine glutinosa* or glutinous hag is the type. See HAG.

N

N, THE fourteenth letter of the English alphabet is one of the nasal liquids of the lingual class. See LETTERS. Its Hebrew (and Phenician) name, *Nun*, signified a *fish*, which its original form was probably meant to represent. N is interchangeable with L (q.v.) and M, as in *co*llect, *com*mingle, *con*fer; and in Ger. *boden*, compared with Eng. *bottom*. In Latin, this letter had a faint, uncertain sound at the end of words and in some other positions, especially before *s*. This accounts for words *on* having lost the *n* in the nominative case, though retaining it in the oblique cases, as *homo*, *hominis;* and for Greek names like *Platon* being written without the final *n* in Latin. The dull, muffled pronunciation of *n*, which is indicated by such words as *consul*, *censor*, *testamento*, being frequently spelled *cosul*, *cesor*, *testameto*, was the first stage of the modern French nasal *n*. Before a guttural letter, *n* naturally assumes the sound of *ng*, as *bank*.

NA'BOB, or NABAB, a corruption of the word *nawâb* (deputy), was the title belonging to the administrators, under the Mogul empire, of the separate provinces into which the district of a *subahdar* (q.v.) was divided. The title was continued under the British rule, but it gradually came to be applied generally to natives who were men of wealth and consideration. In Europe, and especially in Britain, it is applied derisively to those who, having made great fortunes in the Indies, return to their native country, where they live in oriental splendor.

NABONAS'SAR, ERA OF, was the starting-point of Babylonian chronology, and was adopted by the Greeks of Alexandria, Berosus and others. It began with the accession of Nabonassar to the throne—an event calculated (from certain astronomical phenomena recorded by Ptolemy) to have taken place Feb. 26, 747 B.C.

NABULUS', or NABLUS' (a corruption of the Gr. *Neapolis*, New City, the name given to it in the reign of Vespasian), anciently called SHECHEM or SICHEM, in the New Testament (John iv. 5), SYCHAR; is a t. of Palestine, possessing, it is said, "the only beautiful site from Dan to Beersheba." It lies between mount Ebal and mount Gerizim, on the s. side of the valley of Erd-Mûkhna, and has a population variously estimated at from 8,000 to 14,000 of whom about 500 are Christians, 150 Samaritans, and 50 Jews; the rest are Mohammedans, fierce, turbulent, and fanatical. The houses are pretty good, but the streets (as usual in the East) are narrow, gloomy, and filthy. The chief productions are soap, cotton, and oil.

NACHTIGAL, GUSTAV, b. Germany, 1834; studied medicine, which he practiced in Algeria, 1859–63. He then became a physician in the military service of the bey of Tunis, who soon made him his private medical adviser. In 1869 he started for Kuka, joining a caravan which was dispatched to carry from the king of Prussia to the sheikh of Bornoo, some gifts in recognition of his services to various German explorers. After a journey in the Tiboo country, he set out for Kuka, where he arrived in 1870. He made a thorough exploration of Bornoo, from which he went on several exploring expeditions. He went to lake Tchad, and collected a large store of materials in regard to the geography of the s. districts of Sahara. Making his way to Baghirmi, he followed up the Shai river and its tributaries. In the spring of 1878, he set out for Egypt, going s. of lake Tchad, through Waday which he was the first European to penetrate. He visited Abeshr, the capital of Waday, passed through the kingdom of Darfoor, and arrived at Cairo, Nov., 1874. An account of his explorations is given in his *Die Tributären Heidenländer Baghirmis*. He was president, Berlin Geog. Soc. He d. 1885.

NACOGDO'CHES, a co. in e. Texas, bounded on the e. by Attoyac river, and on the s.w. by the Angelina river; 960 sq.m.; pop. '90, 15,984. Co. seat, Nacogdoches.

NACRE. See MOTHER OF PEARL.

NA'DAL, BERNHARD HARRISON, D.D. LL.D., 1812–70; b. Maryland; admitted as a preacher in the Methodist Episcopal church by the old Baltimore conference in 1835. He was the pastor of 15 churches in different states north and south. While a pastor he was a diligent student, and when stationed at Carlisle in 1848 he graduated at Dickinson college, pursuing his studies in connection with his pastoral work. He also taught a class in college. In 1849 he supplied the pulpit of an Independent church in Baltimore. In 1854–57 he was professor in the Indiana Asbury university. In 1857 returning to the Baltimore conference, he was made presiding elder of the Roanoke district in Virginia.

During the slavery agitation at this time he vigorously defended his church and conference. In sermons and addresses he earnestly espoused and aided the cause of the national government in the war of the rebellion, and enjoyed the friendship of President Lincoln. In 1869 he became professor of historical theology in Drew seminary at Madison, N. J., and after the death of Dr. McClintock was acting president.

NA'DIR, an Arabic word signifying that point in the heavens which is diametrically opposite to the zenith, so that the zenith, nadir, and center of the earth are in one straight line. The zenith and nadir form the poles of the horizon (q.v.). See ZENITH.

NADIR SHAH, of Persia, belonged to the Afshars, a Turkish tribe, and was born near Kelat, in the center of Khorassan, Persia, in 1688. When 17 years old, he was taken prisoner by the Usbeks, but escaped after four years of captivity; entered the service of the governor of Khorassan, and soon obtained high promotion. Having, however, been degraded and punished for some real or supposed offense, he betook himself to a lawless life, and for several years was the daring leader of a band of 3,000 robbers, who levied contributions from almost the whole of Khorassan. An opportunity having occurred, Nadir seized the town of Kelat, and gradually extended his territorial authority. Persia was at this time ruled by Melek Ashraf, an Afghan of the tribe of Ghilji, whose grinding tyranny and cruelty produced in the mind of every Persian a deadly hatred of the very name Afghan, which exists to the present day. Nadir having avowed his intention of expelling the hated race from the country, and restoring the Suffavean dynasty, numbers flocked to his standard, and Meshed, Herat, and all Khorassan were speedily reduced. Ashraf, signally defeated in several engagements, fled before the avenger, who, with a celerity only equaled by its thoroughness, purged the provinces of Irak, Fars, and Kerman of even the semblance of Afghan domination. The assassination of Ashraf, during his retreat, terminated the war. The rightful heir, Tamasp, then ascended the throne, and Nadir received for his services the government of the provinces of Khorassan, Mazanderan, Seistan, and Kerman, assuming at the same time the title of Tamasp-kûh (the slave of Tamasp), the title of khan being subsequently added. He was sent against the Turks in 1731, and defeated them at Hamadan, regaining the Armenian provinces which had been seized by the Turks in the preceding reign; but his sovereign having in his absence engaged unsuccessfully the same enemy, Nadir caused him to be put in prison, and elevated his infant son, Abbas III., to the throne in 1732. The death of this puppet, in 1736, opened the way for the elevation of Nadir himself, who was crowned as Nadir Shah, Feb. 26, 1736. He resumed the war with the Turks; and though totally defeated in the first two battles by the grand vizier Asman, turned the tide of fortune in the subsequent campaign, and granted peace to the Turks on condition of receiving Georgia. He also conquered Afghanistan, and drove back the invading Usbeks. His ambassador to the Great Mogul having been murdered along with his suite at Jelalabad, and satisfaction having been refused, Nadir, in revenge, ravaged the Northwest Provinces, and took Delhi, which he was, by the insane behavior of the inhabitants, reduced to the necessity of pillaging. With booty to the amount of £20,000,000, including the Koh-i-nûr (q.v.) diamond, he returned to the w. bank of the Indus. He next reduced Bokhara and Khaurezm, restoring to Persia her limits under the golden reign of the Sassanides. From this period, his character underwent a sudden change; he was formerly open-hearted, liberal, and tolerant; he now became suspicious, avaricious, and tyrannical. The empire groaned under his extortions, and he was finally assassinated on June 20, 1747. His only surviving son was carried to Constantinople, and thence to Vienna, where he was brought up as a Catholic under the surveillance of the empress Maria Theresa, and died a maj. in the Austrian service, under the title of baron Semlin. Nadir's tyranny has now been forgotten; and at the present day he is regarded with pride and gratitude as the "Wallace" of Persia.

NÆ'VIUS, GNÆUS, one of the earliest Latin poets, was born, probably in Campania, in the first half of the 3d c. B.C. In his youth he served in the first Punic war; but about the year 235 B.C. he made his appearance at Rome as a dramatic writer. Of his life, we know little; but of his character rather more. He was very decidedly attached to the plebeian party; and in his plays, satirized and lampooned the Roman nobles with all the virulence and indiscretion of a hot-blooded impetuous Campanian—that Gascon of ancient Italy! His rashness ultimately caused his banishment to Utica in Africa, where he died, 204 or 202 B.C. Besides his dramatic writings, comprising both tragedies and comedies, he wrote an epic poem, *De Bello Punico*, in the old Saturnian meter. Of these, only a few very unimportant fragments are extant, which may be found in Bothe's *Poetarum Latinorum Scenicorum Fragmenta* (Halberstadt, 1824), or Klunmann's collection of the same (Jena, 1843), enriched by a life of Nævius, and an essay on his poetry. See also Sellas's *Poets of the Roman Republic* and Simcox's *Hist. of Latin Lit.* (1882).

NÆ'VUS (known popularly as *mother-spot* or mole) is a congenital mark or growth on a part of the skin. Sometimes it is merely a dark discoloration of the surface as described in the article MACULÆ, in which case it is termed a mole and is perfectly harmless; but often it consists of a dense net-work of dilated blood-vessels, forming a reddish or livid tumor, more or less elevated above the surface of the surrounding skin. The most frequent situations of these vascular nævi are the skin and subcutaneous cellular tissue of the head; but they may occur elsewhere. The popular belief is, that they are caused by

the longing of the mother during her pregnancy for a lobster, or strawberry, or raspberry, or some other red-colored article of food, and that the influence of her mind has impressed upon the fetus a more or less vivid image of the thing she longed for; and hence the name of *mother-spot.* Sometimes these tumors waste away spontaneously, and give no trouble; but frequently they increase rapidly, invade the adjacent tissues, and ulcerate or slough, and thus become dangerous to life by hemorrhage. When these tumors do not show a tendency to increase, no treatment is necessary. When they are obviously increasing in size, the continual application of cold (by means of freezing mixtures), with moderately firm pressure, is sometimes of service; but a more certain method is to employ means to produce such an amount of inflammation as to obliterate the vessels; for this purpose, the seton, the application of nitric acid, and vaccination of the tumor, have been successfully applied. The injection of strong astringents, with the view of coagulating the blood, has sometimes effected a cure. If all these means fail, extirpation, either with the ligature or knife, must be resorted to; the ligature being regarded as the safest and best method. For the various methods of applying the ligature, the reader is referred to any standard work on operative surgery. If the tumor is in an inaccessible spot, as in the orbit of the eye, and is increasing rapidly, the only course is to tie the large vascular trunk supplying it. The common carotid artery has in several instances been tied with success for vascular nævus in the orbit.

NÄ'FELS, a village of Switzerland, in the canton of Glarus, and 4 m. n. of the town of that name, in a deep valley, is one of the most famous battle-fields in the country. Pop. abt. 3,000. Here, in 1388, 1500 men of Glarus, under Matthias am Buhl, overthrew an Austrian force of from 6,000 to 8,000 men. The event is still celebrated yearly.

NA'FTIA, LAGO, a curious small lake in Sicily, about two miles from Mineo, in Catania. It is situated in a plain, amidst craggy hills, and is of a circular form, commonly sixty or seventy yards in diameter, and about fifteen feet deep, but in dry weather shrinking to a much smaller size, and being occasionally altogether dried up. In the midst of it are three small craters, two of which perpetually send up water in jets to the height of two or three feet; the third is more intermittent. The water is greenish, or turbid, and has an odor of bitumen. The whole lake resembles a boiling caldron, from the escape of carbonic acid gas, rushing upwards with great force. The atmosphere is consequently fatal to birds attempting to fly across the surface of the lake, and to small animals which approach it to satisfy their thirst; and an approach to it is attended with headache and other painful circumstances to man himself. The ancients regarded these phenomena with great dread. They supposed that Pluto, when carrying off Proserpine, drove his fiery steeds through this lake, ere his descent to the lower regions. A temple was erected here to the gods of the two craters, the *Dii Palici,* who were supposed to be twin sons of Jupiter by the nymph Thalia. Pilgrims flocked to this shrine; and it afforded an inviolable asylum to slaves who had fled from their masters. An oath by the Dii Palici was never broken by the master, who found himself compelled here to come to terms with his runaway slave. No remains of the temple of the Dii Palici are left, although it is described as having been magnificent.

NAGA is, in Hindu Mythology, the name of deified serpents, which are represented as the sons of the Muni Kas'yapa and his wife Kadrû, whence they are also called Kadraveyas. Their king is S'esha, the sacred serpent of Vishn'u.

NÁGAPATA'M, a seaport of British India, on the Coromandel coast, in the province of Tanjur, 15 m. south of Karikal. It was taken by the Dutch in 1660, but fell into the hands of the English in 1781. Its site is an open sandy plain, elevated only three or four feet abova sea-level. The port is visited by small vessels, and carries on some trade with Ceylon. Pop. at the census of 1881, 53,855.

NÂGÂRJUNA, or NAGASENA, is the name of one of the most celebrated Buddhistic teachers or patriarchs—the thirteenth—who, according to some, lived about 400 years, according to others, about 500 years, after the death of the Buddha S'âkyamuni (i. e., 143 or 43 B.C.). He was the founder of the Mâdhyamika school, and his principal disciples were Aryadeva and Budhapâlita. According to the tradition of the Buddhas, he was born in the south of India, in a Brahmanical family. Even as a child, he studied all the four Vedas; later, he traveled through various countries, and became proficient in astronomy, geography, and magical arts. By means of the last, he had several amorous adventures, which ended in the death of three companions of his, but in his own repentance, and, with the assistance of a Buddhist mendicant, in his conversion to Buddhism. Many miracles are, of course, attributed to his career as propagator of this doctrine, especially in the south of India, and his life is said to have lasted 300 years.—See E. Burnouf, *Introduction à l'Histoire du Buddhisme Indien* (Paris, 1844); Spence Hardy, *A Manual of Buddhism* (Lond. 1853); W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St. Petersburg, 1860).

NAGASA'KI, or NANGASIKI, a city and port of Japan, opened to foreign commerce by the treaty of 1858, on July 1, 1859, is situated in 32° 44′ n. lat., and 129° 51′ e. long., on the western side of a peninsula in the n. w. of the island of Kiusiu. Previously to 1859, it was the only port in Japan open to foreigners. The harbor, which is one of the most beautiful in the world, is about six miles in width, and three or four in length. To

a person inside, it appears completely land-locked, and it is surrounded by hills of about 1500 ft. in height. These are broken into long ridges and deep valleys; while the more fertile spots are terraced and under cultivation. The town of Nagasaki, which is about a mile in length, and three-quarters of a mile in width, lies on the n. side of the bay; its pop. is estimated at 40,000. The streets in general are clean and well-paved, but the houses are not particularly good, except those possessed by courtesans, and known as "tea-houses." On the hills behind the town are various temples, those dedicated to "Sinto," or the worship of the sun goddess, which is the old national religion of Japan, and those in which the Buddhistic worship, imported from China, is followed. The foreign settlement lies to the s. of the native town, the British, French, German, Prussian, and Portuguese consulates occupying the hilly ground back from the bay. On the opposite side of the bay, the Japanese have a steam-factory, under the direction of Dutch officers, and close by is the Russian settlement. The climate of Nagasaki is genial but variable. The trade of Nagasaki is inferior to that of Kanagawa. Sea-weed, salt-fish, and other articles are exported to China. The exports to Europe are mainly tea, tobacco, coal, ginseng, vegetable wax, and copper. The chief imports are cotton piece-goods, woolen goods, sugar, oils.

NA'GELFLUE, the provincial name for a bed of conglomerate belonging to the Mollasse (q. v.), which forms a considerable portion of the strata in the central region of Switzerland, between the Alps and the Jura. It is said to attain the enormous thickness of 6,000 and 8,000 ft. in the Rhigi near Lucerne, and in the Speer near Wesen.

NAGKESUR, the name under which the blossoms of the *Mesua ferrea* are sold in the bazaars of India. See GUTTIFERÆ.

NAGO'YA, a city in Japan, in the province of Owari, a few miles n. of the head of Owari bay, the seat of the Aichi ken, or prefecture, pop. 170,400. The city is regularly laid out, and the castle, built in 1610, is one of the finest among the feudal strongholds still standing intact. Two of its towers were long ornamented by huge images of rampant fish made of copper, covered with plates of solid gold. The great high road called the Tokgido, passes through the city, which has a bustling trade carried on with pack-horses and long narrow carts. Junks and steamers enter and clear at Miya, the seaport, a few miles southward. In the numerous factories in the city, porcelain, faïence, cloisonné, fans, carvings, and lacquer work are made, chiefly for export. In 1891 every house in the place was overthrown by a terrible earthquake.

NAGPUR', an inland province of British India, is under the chief commissioner of the Central Provinces. Its area is 3,843 sq. m., and its pop. in 1891 was 2,982,507; of whom 2,452,884 were Hindus, 89,560 Mohammedans, and 5981 Christians. The n. part of the province is mountainous in character, being traversed by spurs of the great Vindhya range; the general slope of the surface is from n. w. to s. e. and the bay of Bengal receives the drainage of the country chiefly through the rivers Máhandí and Wainganga, the latter a tributary of the Godávari. The climate is not healthy, and is especially insalubrious in the extensive tracts of low marshy land which abound in the province. The Gonds (see INDIA), supposed to be the aborigines, are the most remarkable class of the inhabitants. Among minerals are found gold, antimony, coal and ochre. In the more favored districts, where the inhabitants are more industrious, rice, maize, oil, and other seeds and vegetables are extensively cultivated; but the cotton industry has languished. The rajahs of Nagpur, sometimes called the rajahs of Berar, ruled over a state formed out of a part of the great Mahratta kingdom. The dynasty, however, died out in 1853, and the territory came into possession of the British. The province has five divisions — cap., Nagpur.

NAGPUR', a city of British India, capital of the province of the same name, and situated near its n. w. extremity, in an unhealthy swampy hollow, 430 m. in a direct line e.n.e. of Bombay lat. 21° 9′ n. long. 79° 7′ e. Inclusive of its extensive suburbs, it is 7 m. in circumference. It contains some Hindu temples of excellent Mahratta architecture. Cotton cloths, coarse and fine chintzes, turbans, silks, brocades, blankets, woolens, tent-cloths, and articles in copper and brass are manufactured. Here, on Nov. 26 and 27, 1817, a small British force of 1350 men, commanded by col. Scott, defeated a native army of 18,000 men. Pop. '91, 117,014, of whom 95,549 were Hindus, 16,387 Mohammedans and 3087 Christians.

NAG'S HEAD CONSECRATION. This story, which was first circulated by the Roman Catholics forty years after the event, with respect to Archbishop Parker's consecration, was to the following effect. On the passing of the first Act of Uniformity in the first year of Queen Elizabeth, fourteen bishops vacated their sees, and all the other sees excepting that of Llandaff being vacant, there was difficulty in maintaining the hitherto unbroken succession of bishops from apostolic times. Kitchin of Llandaff refused to officiate at Parker's consecration, and consequently the Protestant divines procured the help of Scory, a deprived bishop of the reign of Edward VI., and all having met at the Nag's Head tavern in Cheapside, they knelt before Scory, who laid a Bible on their heads or shoulders, saying: "Take thou authority to preach the word of God sincerely;" and they rose up bishops of the new church of England! The story is discredited by

the Roman Catholic historian Lingard, and is carefully refuted by Strype in his life of Parker. The facts of the case are, that the election took place in the chapter-house at Canterbury, the confirmation at St. Mary-le-Bow's church in Cheapside, and the consecration in the chapel of Lambeth palace. Scory, then elected to the see of Hereford; Barlow, formerly bishop of Wells, then elected to Chichester; Coverdale, formerly of Exeter, and never reappointed to any see; and Hodgkin, suffragan of Hereford, officiated at the consecration. The Nag's Head story probably arose from the company having possibly gone from Bow church, after the confirmation, to take a dinner together at the tavern hard by, according to the prevailing custom. The due succession of bishops in the English church cannot be proved to have ever been broken.

NAGY, a Hungarian word, meaning "great." It is prefixed to the names of many towns in Hungary and Translyvania. In the present work, many of the towns that take this prefix are given under the name that comes after it.

NA'GY KARO'LY (i. e. Great Karóly), a town of Hungary, capital of the country Szathmar, 37 m. e.n.e. from Debreczin, on a small feeder of the Theiss. It has several important annual fairs, and a trade in grain and textile fabrics. Pop. '90, 13,475.

NAGY KÖRÖS. See Körös.

NAGY—SZEBEN. See Hermannstadt.

NAGY—VARAD. See Grosswardein.

NAHANT, a town in Essex co., Mass.; on a peninsula extending into Massachusetts bay; reached by stage from Lynn (4 miles) and by steamers from Boston in summer (10 miles). It was incorporated in 1853, contains the village of Bass Point, and is almost exclusively a summer resort. It has a public library, electric lights, waterworks, and several churches. The beaches are hard and smooth, and in places the shores are fringed with rocks from 20 to 60 feet above high tide. Nahant has been a favorite place of summer resort for Boston business men for many years, and has numerous handsome seaside residences. Pop. '90, 880.

NA'HUM, one of the twelve minor prophets, was a native either of Elkosh, in Galilee, or the son of a man named Elkosh. The identification of his birthplace with Capernaum (Nahum's village) or a place called Elkosh, on the east side of the Tigris, not far from Nineveh, is the result of vague speculation. He was probably a contemporary of Isaiah, and flourished about 713–711 B.C. The burden of his "vision" (in chap. 3) is the destruction of Nineveh and the downfall of the Assyrian kingdom. His style is full of animation, fancy, and originality, and at the same time clear and rounded. His language throughout is classical, and in the purest Hebrew, belonging to the second half of Hezekiah's reign, or to the time immediately following the defeat of Sennacherib before Jerusalem (2 Kings xix, 35, etc.). A commentary on Nahum, with special reference to the Assyrian monuments lately discovered, has been written by O. Strauss (Berlin, 1853). There are also commentaries by Blomquist (1853); Gihl (1860); *Breitenicher* (1861); Reinke (1867) and Mahler (1886).

NA'IA. See Asp and Cobra.

NA'IADES, NAIADA'CEÆ, or **POTAMEŒ,** a natural order of endogenous plants, divided by some botanists into several orders (*juncagineæ, zosteraceæ*, etc.), containing in all not quite 100 known species, all aquatic plants, some of them inhabiting the ocean, some found in lakes and ponds, some in streams. They are all of very cellular structure; the leaves have parallel veins, and the flowers are inconspicuous. To this order belongs the pondweed (*potamogeton*), of which a number of species abound in the still waters of Britain, and of which some are found as far n. as Iceland. To this order also belongs the Grasswrack (q.v.) of our shores, used for stuffing mattresses. The lattice-leaf (q.v.) of Madagascar is one of the most interesting species, and one of the few which attract notice as in any way beautiful.

NA'IADS, in Grecian mythology, the nymphs of fresh-water lakes, rivers, and fountains. They were believed to possess the power of inspiration; hence, soothsayers and others are sometimes called *nympholeptoi* (seized by the nymph). They were represented as half-clothed maidens, and not unfrequently as companions of Pan, of Hercules, the patron of warm springs, or of the Sileni and the Satyrs, in whose jovial dances they join.

NA'IANT, or **NA'TANT** (Lat. *natare*, to swim), a heraldic term applied to a fish when borne horizontally across the shield in a swimming position.

NAIGUE, or **NAIK,** a native subaltern officer among Indian and Anglo-Asiatic troops, whose functions are somewhat analogous to those performed among European troops by the drill-sergeant.

NAIL is a unit of English cloth measure, indicating the sixteenth part of a yard, or two and one quarter inches. Abbreviated *n.*

NAILS are flattened, elastic, horny plates, which are placed as protective coverings on the dorsal surface of the terminal phalanges of the fingers and toes. Each nail consists of a *root*, or part concealed within a fold of skin; a *body*, or exposed part

attached to the surface of the skin; and a free anterior extremity called the *edge*. The skin below the root and body of the nail is termed the *matrix*, from its being the part from which the nail is produced. This is thick, and covered with highly vascular papillæ, and its color is seen through the transparent horny tissue. Near the root the papillæ are smaller and less vascular; hence the portion of nail corresponding to this part is of a whiter color; from its form, this portion is termed the *lunula*. It is by the successive growth of new cells at the root and under the body of the nail that it advances forwards, and maintains a due thickness, whilst at the same time its growth in a proper direction is insured. The chemical composition of the nails is given in the article Horny Tissues, to which class of structures they belong. According to the observation of Beau, the finger-nails grow at the rate of about two-fifths of a line in a week, while the toe-nails only grow with about one-fourth of that rapidity. When a nail has been removed by violence, or has been thrown off in consequence of the formation of matter (pus) beneath it, a new nail is speedily formed, provided the matrix has not been seriously injured.

There is a very common and troublesome affection popularly known as *ingrowing nail*. Its most usual seat is by the side of the great toe. It does not in reality arise from any alteration of the nail, but from the adjacent soft parts being constantly pressed by the use of tight shoes against its edge. These parts become swollen and inflamed; suppuration ensues, and an intensely sensitive ulcer is formed, in which the nail is embedded. Surgical advice should at once be resorted to in these cases, as there is no probability that the ulcer will heal spontaneously, especially if the patient continue to move about, and thus keep up irritation. In obstinate cases, it is not unfrequently necessary to remove a portion of the nail, an operation attended with much pain, although quickly performed. See Claws.

Nails, pointed pieces of metal, usually with flattened or rounded heads, used for driving into wood-work, for the purpose of holding the pieces together. A variety, in which the head is very large, and the spike portion small, used by shoemakers for protecting the soles of boots and shoes from wear, is called the *hob-nail*; another, which is made by cutting thin plate-iron into thin pointed pieces of various lengths, is called *brads*; these sometimes are without heads, but are usually made with a slight projection by way of a head. When made small, with flat heads, for attaching cloth or hangings in upholstery-work, they are called *tacks*; and when very large for heavy carpentry, *spikes*.

Nail-making.—Formerly, all nails were hand-made, by forging on an anvil; and in Britain and the north of Europe vast quantities are still made in this manner, being preferable, for many kinds of carpenters' work, to those made by machinery. In France, the greater part of the nails used for light carpentry-work are made of soft iron wire, pointed with the hammer; and in order to head them they are pinched in a toothed vice, which leaves the portion for the head projecting, and makes below it three or four grooves in the nail, which increases its hold on the wood when driven home. The head is beaten into a counter-sinking on the vice, which regulates the size.

The iron used for hand nail-making in Britain is sold in bundles, and is called *nail-rods*; it is either prepared by rolling the malleable iron into rods or small bars of the required thickness—which process is only employed for very fine qualities—or by cutting plate-iron into strips by means of rolling-shears; these shears consist of two powerful revolving shafts, upon which are fixed discs of hard steel with squared edges. The discs of one shaft alternate with those of the other; they are of the thickness of the plate to be cut, and the shafts are so placed that a small portion of one set of the discs are inserted between those of the other set. When the shafts are revolving a plate of iron is pressed between the discs; and it is forcibly drawn through, the steel discs cutting the plates into strips with great rapidity. The quantity produced in this way is enormous, some mills turning out at the rate of ten miles per hour of nail-rods.

Several inventions, in which America took the lead, have been introduced, and are successfully worked, for making nails direct from plate-iron, either by cutting them out cold or hot; and a very large proportion of the nails in use are made in this way. Nail-making by machinery was originated in Massachusetts in 1810.

The whole enormous industry of nail-making in the United States, except for wall-nails and shoe-nails, which are cast, and sprigs, headless brads, etc., which are cut out of the plate, involves various machines for cutting and heading. Nearly two dozen patents for improvements in these machines had been granted here by the beginning of the century. The ore, whether hematite or magnetic, is smelted in a blast-furnace, run into pigs, puddled, squeezed, and, if need be, hammered, rolled in the puddling-ball train, and cut to lengths. These are then fagotted, that is, piled so as to break joints, reheated to a white heat, drawn, passed through the nail-plate train, and the sheets, of the required width and thickness, allowed to cool. It is next cut across its length (the width of the sheet being usually about a foot) into strips which are a little wider than the length of the required nail. These plates, heated by being set on edge on hot coals, are seized in a clamp and fed to the machine, end first. The pieces cut out are alternate, and slightly tapering, of course, with the fiber, and are squeezed and headed up by the machine before going into the trough. It is evident that the first cut to the right on a

plate and the last cut on the other side are blanks, though it would seem that an automatic weigher, as in coining, would reject these into the waste heap. The difficulty of the operation lies in the fact that the cuts must be alternate, so that the cutter must either turn half round at each cut, or the plate must be turned over. The great desideratum is to do this automatically and reciprocally. There is no common or unvarying standard for classifying nails. The old way is by sizing from two-penny, 1 in. long, and now 880 to the lb., up to thirty-penny, 4½ in. long, and 16 to the lb. The English names, 7 lb., 8 lb., etc., show that 1000 of that kind should weigh so much. They now, in fact, seldom do. The general divisions are:

a. Material—copper, galvanized, etc.
b. Make—wrought, cut, cast.
c. Length or weight.
d. Size—fine, bastard or medium, heavy.
e. Points—flat, sharp, clinch.
e. Heads—spur, clasp, clout, countersunk, etc.
f. Use—scupper, sheathing, fence, slating, finishing, etc.

Wire nails, a French invention, are made by a machine in which the end of a coil of wire is held for a moment by cam-grippers while the head is formed by a punch. The wire is then pushed out the length of the nail, two punches point it, and a "knocker-off" throws aside the completed nail. Nails are now made in this country from tinplate "scrap," or sheet-iron coated with tin. The machine for making them was invented by Mr. G. H. Perkins, of Philadelphia, in 1889.

NAIN, a village of Galilee, mentioned only in the New Testament as the place where Jesus restored to life the widow's son. Eusebius and Jerome describe it as near Endor. Phocas places it n. of Tabor. The crusaders recognized it, and at the present day it is mentioned by travelers. It is now a small village of 20 houses or huts, and called Nein, containing remains of very ancient buildings and a fountain. It is 4 m. from Tabor, and 2½ m. from Endor. Its situation is beautiful, on the n.w. edge of the "Little Hermon," or Jebel-ed-Dûhy, where the ground slopes into the plain of Esdraelon. The entrance to the place, where the Savior met the funeral, was doubtless up the steep ascent of the plain. On the w. of the village the rock is full of sepulchral caves. On the n. are the wooded hills of Galilee.

NAIN DE TILLEMONT. See TILLEMONT.

NAIRN, in the county of the same name, is a royal and parliamentary burgh, and is 15 m. n.e. by rail from Inverness. It is situated at the mouth of the river Nairn, on the w. side, and for that reason was anciently called Iver-nairn. Lying on the southern shore of the Moray firth, which is here about about 8 m. across, it commands a grand and extensive view of the coast of Ross-shire, including Cromarty bay, nearly opposite. Nairn was regalized by William the Lion. It manufactures rope and twine, and exports corn, timber, potatoes and fish. It is principally remarkable for the excellence of its sea-bathing and artificial baths. Pop. 4500.

NAIRNE, CAROLINA OLIPHANT, Lady, 1766–1845; b. Scotland; celebrated in her youth for her beauty, and called "the flower of Strathearn." She married, in 1806, William Murray Nairne, who became lord Nairne in 1824. She wrote many songs to the old popular tunes familiar to the Scotch peasantry. Among them are the well-known *Caller Herrin'; The Laird o' Cockpen;* and *The Land o' the Leal.* Her productions all appeared anonymously, and their authorship was not divulged till shortly before her death. Her complete works, with a life by the Rev. Charles Rogers, appeared at Edinburgh in 1869.

NAIRNSHIRE is bounded on the n. by the Moray firth, and on its other sides by the counties of Inverness and Moray, of the latter of which it anciently formed a part. It extends n. and s. 22 m., and 15 m. from e. to west. Its area is 215 sq.m., or 137,500 acres, of which about 26,000 are under cultivation. Pop. '91, 10,000, including the burgh of Nairn. Along with Elginshire, it returns one member to parliament. The county now contains four entire parishes and part of a fifth. Nairn is the only royal burgh in the county, but there are the villages of Cawdor and Auldearn. The soil is for the most part light and sandy, but on the plain or "laich" is very fertile. There is considerable agricultural activity, though the county is, perhaps, better known for its cattle-breeding. An important cattle "tryst" is held at Cawdor once a month during the greater part of the year. The climate of this county is distinguished for its salubrity, and the temperature is remarkably equable. The thermometer in the shade has not risen above 78° 3′, or fallen below 11° 2′, during the last 20 years. According to the latest observations, the yearly rainfall did not amount to more than 26 in., the greatest fall being in October, and the least in April. Geologically Nairn resembles Elginshire. The river Nairn runs through the county in a beautiful valley, which presents particularly attractive and romantic scenery in the neighborhood of Cawdor castle, one of the residences of the earl of Cawdor. This castle is of uncertain antiquity, and is in an excellent state of preservation. It was the residence of the ancient thanes of Cawdor, one of whom is mentioned in *Macbeth.* About the year 1510 the estates belonging to the earldom passed by marriage from the old family of Calder into the hands of a son of the duke of Argyle,

and are still in the possession of his descendants. Among the places of historical interest to be found in the county of Nairn is the battle-field of Culloden.

NAISSANT, a term applied in heraldric blazon to an animal depicted as coming forth out of the middle—not like *issuant* or *jessant* (q.v.), out of the boundary line—of an ordinary.

NAJA. See Cobra da Capello.

NAKAMURA MASANAWO, a Japanese scholar and writer, b. in Yedo about 1825, one of a hereditary guild of learned men in the university of Yedo, under the patronage of the Tokugawa "tycoons." To his profound knowledge of Chinese and native literature, he added some acquaintance with the Dutch, but soon abandoned it for the English language, a dictionary of which he laboriously copied with the pen. In 1866 he went to England, and studied there two years. Returning to Japan in 1868, he went into seclusion with his master the tycoon, and while there translated into Japanese the constitution of the United States, Washington's farewell address, John Stuart Mill's essay "On Liberty," a copious selection of long passages from the works of standard American and English authors, and an anonymous plea in behalf of Christianity. Voluntarily resigning his rank among the gentry (samurai), he laid aside his two swords, founded a private school, and became a vigorous reformer and practical philanthropist. In 1875 he was made chief director of the imperial female normal school. He has also translated *Wheaton's International Law*, and Smiles's *Self-Help*. He belongs to that quiet but powerful class of men whose words and example have revolutionized Japan.

NAKCHIVAN, or Nakhichevan, a town of Asiatic Russia, Transcaucasia, 83 m. s.e. of Erivan. It is the capital of a district of the same name, comprising also the towns of Abbasabad, Mergeri, and Terra Kali which is separated southward from Persia by the Arras river, and was ceded to Russia, 1828. The name is from the Armenian, Naxuana, "first place of descent," and popular tradition asserts it to be the place where the survivors of the deluge landed, and where Noah planted the vine. At any rate it is a very old town, dating from the sixth century B.C. The district is rich in salt, but is noted for insalubrity. Pop. of the town, 6950.

NAKHICHEVAN, on the Don, a thriving town of south Russia, in the government of Ekaterinoslav, on the right bank of the Don, and near the mouth of that river 2½ miles east of Rostov. It was founded in 1779 by Armenian settlers from the Crimea, and has 19,500 inhabitants, mostly Armenians, belonging to the Greek-Armenian church. The inhabitants are engaged in the manufacture of silver ornaments and woolen goods, and an extensive trade is carried on.

NAKHIMOV, Akim Nikolaevich, poet, 1782–1805, b. in government of Kharkov, Russia. After being educated in Moscow and at the University of Kharkov, he retired to his father's estate in the country and produced poems, conspicuous among which is his *Satirical Elegy* (1809). See 7th edition of his complete works in Smirdin's collection (1852).

NAKSHATRA (a Sanscrit word of doubtful etymology, but probably a compound of an obsolete base, *naksha*, night, and *tra*, protecting, i.e., literally night-protecting) means properly star, and is used in this sense in the Vedas. At a later period it was applied to the asterisms lying in the moon's path, or to the mansions in which the moon is supposed to rest in her, or rather, according to Hindu notions, *his* path. The number of these asterisms was reckoned originally at 27, later at 28; and mythology transformed them into as many daughters of the patriarch Daksha, who became the wives of the moon. See Moon. Biot, the distinguished French astronomer, endeavored to show that the Hindu system of the Nakshatras was derived from the Chinese *sien;* but his theory, though supported by very learned arguments, has been refuted by Prof. Whitney, in his notes to Burgess's translation of the *Sûrya-Siddhânta* (New Haven, Ct., U. S. A., 1860), and by prof. Müller in his preface to the fourth volume of the *Rig-Veda* (Lond. 1862); for their arguments leave little doubt that the system of the Nakshatras originated from the Hindu mind.

NALA is a legendary king of ancient India—a king of Nishadha—whose love for Damayantî, the daughter of Bhîma, king of Vidarbha, and the adventures arising from, or connected with it—the loss of his kingdom, the abandonment of his wife and children, and their ultimate restoration—have supplied several Hindu poets with the subject of their muse.

NAMANGAN, district in the central Asiatic province of Ferghana in the general government of Turkestan, on the right bank of the Sir Darja. Pop. 198,560. Agriculture is confined to the oases. The capital of the same name has considerable trade in fruits, hides and wools. Pop. '97, 61,906. In the neighborhood are rich oil wells and coal deposits.

NALODAYA is the name of a Sanscrit poem which is highly prized by the modern Hindus. Its subject is the story of Nala (q.v.), but more concisely narrated than in the episode of the *Mahâbhârata*, whence its contents are borrowed; and its reputed author is Kâlidâsa (q.v.). Great doubts, however, must attach to the attribution of the authorship, if by Kâlidâsa the author of *Sâkuntala* is meant, and not some other poet bearing the same name; for the merits of this poem consist neither in elevation of thought nor in richness of fiction: they are sought for by the Hindus in its elaborate and artificial diction, and in its alliteration of every variety, which, to a European mind of culture and taste, would be no more than an intolerable jingle of sounds, devoid of all poetical worth. The text

of the poem, with a modern commentary, has been edited (Berlin, 1830) by F. Benary, and (Calcutta, 1844) by W. Yates, who added to his edition a free metrical translation of the text and an essay on Sanskrit alliteration.

NAMA'QUALAND, or more correctly NAMALAND, GREAT. Comprises the southern parts of German Southwest Africa, extending from the Orange river, lat. 29° 30′, to Walfish bay, lat. 23°, and stretching inland from the w. coast to the Kalihari desert, comprehending an area of about 100,000 sq. m., is known under the name of Great Namaqualand, being principally inhabited by wandering tribes of Namaquas (q.v.). This region is drained principally by a large periodical water-course, called the Oup, Borradaile, or Great Fish river, which, running from n. to s. a distance of about 450 m., joins the Orange river nearly at right angles, about 90 m. from its mouth. It is generally, except in its northern parts, where the country rises into extensive and lofty plateaus, a most sterile and barren region, and along a coast-line of upwards of 400 m. does not present a single running stream, much less a navigable river, although a few little bays along the coast, such as Angra Pequeña, Sandwich harbor, and Walfish bay, afford safe anchorages. The valley of the Oup is bounded on each side by ranges of flat-topped barren mountains rising to about 5,000 feet, which to the eastward die away into the waterless though wooded flats of the Kalihari desert, and coastwards stretch into vast sandy downs, against which the southern Atlantic beats an unceasing surf, rendering landing very dangerous, and enveloping the coast in a perpetual mist. The chief productions of the region are cattle, for the rearing of which the country seems favorable. On the edge of the Kalihari, ivory and ostrich feathers are collected, and copper ore seems abundant in several localities. Guano is found at Ichaboe and many little islands on the coast, and considerable fisheries are carried on by Cape houses in many of the bays.

The lion, giraffe, rhinoceros, hippopotamus, and large game generally, are still found in Namaqualand, although fast diminishing before the fire-arms of the Namaquas. The snakes are considered especially venomous. The gemsbok, eland, and other large antelopes, now almost unknown in the Cape Colony, are still numerous in the little-frequented wastes of this region. The climate is extreme, and though on the whole not unhealthy, is very trying to European constitutions. The water is generally brackish. The first English traveler in Namaqualand, was sir J. Alexander, who, in 1837, traversed it from n. to s. Charles John Anderson has also explored every part of it. Information on the region may be also found in the travels of Moffat, Campbell, and Le Vaillant. Angra Pequeña founded in 1883 on the coast is notable as being the first African colony of the German Empire.

NAMAQUALAND, LITTLE, is the northwest corner of Cape Colony, s. of the Orange river, formerly part of the district of Clanwilliam, and included with the country n. of it under the general name of Namaqualand. It is a very barren region, covered with rugged volcanic-looking hills, through which the Gariep or Great Orange river appears, through some convulsion of nature, to have forced its way to the sea. Little Namaqualand has of late years afforded a very large supply of copper ore of excellent quality; but the mines, although well known to the Dutch 200 years ago, were not worked till after 1852. The Ookiep copper mines are the most important, being connected by rail with the western coast. The principal river is the Orange of the colonists, which divides the Cape Colony from Great Namaqualand; all the other streams are merely periodical torrents, often dry for years. The seat of magistracy is at Springbokfontein, about 80 m. from the principal harbor, Hondeklip bay, and where are situated the very rich mines of the Cape copper company. Many scattered tribes of Namaquas and Bastard Hottentots roam along the bank of the Orange river, and in the neighborhood of the mines are numerous Dutch farmers and English settlers. All the larger mammalia, except a few gemsbok, are extirpated; but troops of ostriches are still numerous on the grassy flats of the Bushman country. The geological features of this region are peculiarly interesting, and have been thoroughly explored by A. Wylie, on behalf of the Cape government. The rocks are generally of granite or gneiss, intersected with numerous veins of cupreous indications, and near the Orange river present many very curious features. The coast line extends for 100 m., with a few little bays, such as port Nalloth and Hondeklip, where there is tolerably safe anchorage, and generally presents a shore covered with low granite rocks.

NAMA'QUAS, the principal existing tribe of the race generally known under the name of Hottentot. They inhabit the region called Great Namaqualand, n. of the Gariep or Orange river, and the country a few miles s. of it, as far as the Kamiesbergen. They are a pastoral people of rather predatory habits, and live under the rule of their chiefs, whose powers, however, are of a very limited nature. Differing from the Bosjesmen Hottentots, the Namaquas are a tall, well-made, active people, although presenting the usual peculiarities of the race, such as the light olive complexion, the oblique eye, and short tufted hair. They speak a dialect of the Hottentot language, which, however, differs considerably from that used by other tribes of that people. Mission stations of the Rhenish and Weselyan societies have been for many years established amongst them, and in a few localities, near the Cape Colony, with considerable success; and the New Testament and some elementary works have been translated into the Namaqua dialect. On the northern borders of the regions they inhabit, the Namaquas, under the chief

Africaner, the descendant of a fugitive slave from Cape Colony, have for many years kept up a predatory and bloody war with the tribes of Ovampos and Damaros, who live n. of Walfish bay. The total number of Namaquas cannot exceed between 50,000 and 60,000 souls, scattered over a region of at least 150,000 sq.m.; and there is every prospect of the pure Hottentot tribes soon becoming extinct, or at least absorbed, being gradually supplanted by the more energetic and civilized Bastard races, who, in point of civilization and appearance, are very little inferior to the ordinary Dutch Boer of Cape Colony. Many of the southern Namaquas possess wagons and oxen, and are employed in the transport of copper ore from the mines of Little Namaqualand to the shipping port at Hondeklip bay.

A few of the peculiar customs of the Hottentot tribes, described by Kolben nearly 200 years ago, may be still traced amongst the more remote tribes of the Namaquas; but contact with the Cape Colonists, and the efforts of the missionaries, have partially civilized this race, so that an ordinary Hottentot is quite as respectable a savage, or perhaps more so than his Betjouana or Amakosa brethren.

NAMAYCUSH (*Salmo namaycush*), a fish nearly allied to the salmon and trout, a native of the great lakes and interior rivers of North America. It is often taken of a size varying from 20 to 40 lbs., and is said sometimes to reach 60 lbs. It is much esteemed for the table. It is caught at the same fisheries with the still more prized whitefish (q.v.).

NAME (Sax. *nama*, Ger. *name*, Lat. *nomen*, Gr. *onoma*), the word by which a particular person or thing is signfied in distinction from other persons or things. A name attached to a person is called a proper name. Names distinguishing one individual from another have been in use from the earliest ages of human society. Among the Jews, the name given to a child either originated in some circumstance of birth, or was an expression of religious sentiment. Old Testament names are almost all original—i.e., given in the first instance to the person bearing them; but the Jews, like other nations, after accumlating a considerable stock of names, began to repeat them, and we find few names in the New Testament which had not been used before. In Old Testament times, it was an occasional practice to adopt a change of name on the occasion of an important event in one's life.

The Greeks bore only one name, given on the tenth day after birth, which it was the right of the father to choose, and alter if he pleased. The earliest Greek names are generally expressive of some quality in high estimation, as valor, skill, wisdom, or gracefulness (Callimachus, excellent fighter; Pherecrates, strength bringer; Sophron, wise; Melanthus, black flower). In later times, when the faith in the gods was on the wane, names derived from Apollo and Athene, or indicative of the favor of Olympus (Apollodorus, gift of Apollo), came more into fashion. The eldest son generally bore the name of his paternal grandfather, and the confusion arising from the repetition of the same name was attempted to be obviated by appending the father's name (either simply, or turned into a patronymic), the occupation, the place of birth, or a nickname.

The Romans at a very early period bore two names, and afterward every Roman citizen had three. The *prænomen*, like our Christian name, was personal to the individual—Caius, Marcus, Cneius; in writing, generally abbreviated to an initial or two letters, C., M., or Cn. It was given in early times on the attainment of puberty, and afterward on the ninth day after birth. There were about thirty recognized prænomina. Women had no prænomia till marriage, when they took the feminine form of that borne by their husband. Every Roman citizen belonged both to a *gens* and to a *familia* included in that gens. The second name was the *nomen gentilicium*, generally ending in *-ius*, *-eius*, or *-aius*. The third name was the hereditary *cognomen* belonging to the familia. Cognomina were often derived from some bodily peculiarity, or event in the life of the founder of the family. A second cognomen, or *agnomen*, as it was called, was sometimes added by way of honorary distinction. In common intercourse, the prænomen and cognomen were used without the nomen gentilicium, as C. Cæsar for C. Julius Cæsar, M. Cicero for M. Tullius Cicero. The Roman names were in their origin less dignified and aspiring than the Greek; some were derived from ordinary employments, as Porcius (swinehead), Cicero (vetch grower); some from personal peculiarities, Crassus (fat), Naso (long-nosed); a few from numerals, Sextus, Septimus.

The Celtic and Teutonic names, like the Jewish and Greek, had been originally very significant; but at an early period their exuberance became checked; people contented themselves with repeating the old stock. While the speech of Europe was undergoing a transformation, the names in use remained the same; belonging to an obsolete tongue, their signification by and by became unintelligible to the people using them. Many are derived from "God," as Gottfried, Godwin; some from an inferior class of gods known by the title *as* or *ans*, whence Anselm, Oscar, Esmond; others from elves or genii, Alfred, Alboin, Elfric (Elf King). Bertha is the name of a favorite feminine goddess and source of light, from the same root as the word "bright;" the same word occurs as a compound in Albrecht, Bertram. To a large class of names indicating such qualities as personal prowess, wisdom, and nobility of birth, belong Hildebrand (war brand), Konrad (bold in counsel), Hlodwig (glorious warrior), called by us Clovis, and the

original of Ludwig and Louis. The wolf, the bear, the eagle, the boar, and the lion entered into the composition of many proper names of men, as Adolf (noble wolf), Arnold (valiant eagle), Osborn (God bear). Respect for feminine prowess also appeared in such names as Mathilde (mighty amazon), Wolfhilde (wolf heroine). The spread of Christianity threw a number of the old names into comparative oblivion, and introduced new ones. The name selected at baptism was more frequently taken from the history of the Bible or the church than from the old traditional repertory, which, however, was never altogether disused. Many names, supposed to be local and very ancient, particularly in the Scottish highlands, Wales, and Cornwall, are in reality but corruptions of names of Christian origin which are in use elsewhere. Owen, Evan, and Eoghan (the latter often anglicized into Hector) seem all to be forms of Johann or John. A change of name was sometimes made at confirmation.

Periods of religious and political excitement have had a very powerful influence in modifying the fashion in names. The Puritans would only admit of two classes of names, those directly expressive of religious sentiment—praise-God, live-well—and names which occur in Scripture; these latter indiscriminately made use of, however obscure their meaning, or however indifferent the character of the original bearer of them. Old Testament names were used in preference to New, probably because they did not convey the notion of a patron saint. Old Testament names still prevail largely in America, where exists a medley of Christian names from all possible sources. At the French revolution, names supposed to savor of either loyalty or religion were abandoned, and those of Greek and Roman heroes came into vogue instead. The Augustan period of English literature gave a temporary popularity to such feminine names as Narcissa, Celia, Sabina. In Germany, the names in use are particularly free from foreign admixture; they are almost all either of Teutonic origin, or connected with the early history of Christianity. In Britain, the number of names has, particularly since the reformation, been more limited than in most other countries. In some families of distinction, unusual names have been handed down from father to son for centuries—e.g., Peregrine among the Berties, and Sholto in the Douglas family. The accumulation of two or more Christian names only became common in the present century, and another practice which has gained ground in Britain is the use of surnames as Christian names. More recently, various old names, particularly feminine names, as Maud, Florence, Ethel, have been withdrawn from their obscurity, and resuscitated.

The use of fixed family *surnames* cannot be traced much further back than the latter part of the 10th century. They first came into use in France, and particularly in Normandy. At the Conquest, they were introduced into England by the Norman adventurers, and were general at the Domesday Valuation. Many of the followers of William had taken names from their paternal chateaux or villages on the other side of the channel, names which were used with the French preposition *de* before them. Their younger sons and others applied the "de" to estates awarded them as their portion of the conquered country, and called themselves De Hastings, De Winton, etc., a prefix probably never in vernacular use in England, and completely discarded with the disappearance of Norman-French, unless in a few cases where it was retained for the sake of euphony, or from coalescing with the initial vowel, as in De la Bèche, Danvers (d'Anvers), Dangerfield (d'Angerville). When English was used in place of Norman-French, the "de" was always rendered into "of." The affectation of resuming it in recent times is as unwarrantable in theory as in taste. Such a designation as lord De Tabley of Tabley House is an unmeaning tautology. The Scotch have a more expressive designation when they say Colquhoun of that Ilk. In France and Germany, a territorial surname (denoted by "de" or "von") came, when surnames spread to all classes, to be the mark of nobility, so much so that in latter times, when any one was ennobled by the sovereign, the "de" was prefixed to his previously plebeian and not territorial name. In Britain, the "de" was never considered the test of nobility; the names of some of the most distinguished families were not territorial—e.g., Stewart, Butler, Spencer. In Scotland, surnames were hardly in use till the 12th c., and were for a long time very variable. The assumption of surnames by the common people is everywhere of much later date than their use by noble (gentle) families. As yet, they can hardly be said to be adopted by the people of the wilder districts of Wales.

There are many existing local surnames in Britain besides those derived from the names of the manors of the gentry or landholders. Farms, homesteads, the natural features of the country, all gave their names to those who resided at or near them; hence such names as Wood, Marsh, Dale. The preposition "at" is in a few cases retained, as in Atwood, A'Court, Nash (atten-ash, i. e., at the ash). The traveling habits of the Scots account for such names as Inglis, Fleming, Welsh (the original of Wallace), applied to those who had visited foreign parts; and sometimes a Scotsman, wandering into England, returned with the acquired name of Scott.

A large class of surnames are patronymics, often formed by "son," or its equivalent in the language of the country, added to the Christian name of the father. Names of this sort often fluctuate from generation to generation. Alan Walterson had a son, Walter, who called himself Walter Alanson. The genitive case of the father's name sometimes served the same purpose, as Adams, Jones; and similarly in Italian, Dosso, Dossi. A fashion of using "Fitz," the equivalent of "son," before the ancestral name, as in Fitz-

herbert, prevailed temporarily in Normandy, whence it was imported into England. In the highlands of Scotland, the prefix "Mac" (Macdonald) served the same purpose, which, however, fluctuated far longer than the patronymic surnames of England and the lowlands; so also the "O" (grandson) of the Irish (O'Neil), and "Ap" of the Welsh (Ap Rhys, otherwise Apreece). The "de" of France had sometimes a similar origin, as in d'André d'Hugues; and still more frequently the "de," "dei," or "degli" of Italy—di Cola, di Giacomo.

Office, occupation, or condition, gives rise to surnames—e.g., Knight, Marshall, Page, Smith, Brewster, Shepherd; in Germany and Holland, Rauber and de Rogver (robber), and from such appellatives, patronymics may be again derived; thus, we have Smith son, de Maistre (master's son), M'Nab (son of the abbot), M'Pherson (son of the parson), del Sarto (son of the tailor), etc. So also personal qualities—Black, White, Strong, Stark, Lang (long), Littlejohn, Cruikshanks; and nicknames have not infrequently been perpetuated as surnames. We have also surnames derived from the signs and cognizances which were borne in the middle ages, not only by inns and shops, but by private houses. John at the Bell became John Bell; at Middleburg, in Holland, Simon, apothecary in the "Drake," or Dragon, became Simon Draek; hence, probably, the frequency of family names derived from animals, and also of those beginning with "Saint;" though this last class may, perhaps, sometimes have had its origin in the first owner of the name dedicating himself to the service of the saint in question. In Scotland and Ireland, "The" is a distinctive title borne by the heads of some old families—as "The Chisholm," "The O'Connor Don." In the highlands of Scotland, the chief of a clan is usually addressed by the name alone in a marked manner: thus, "Macleod" implies specially Macleod of Dunvegan, in Skye, head of the clan Macleod; "Mackintosh," in like manner, applies solely to Mackintosh of Moy, in Inverness-shire.

In England, the number of existing surnames approaches to 40,000, or about one to every 500 individuals; in Scotland, there are far fewer surnames in proportion to the population. The remarkable predominance of certain surnames in certain localities—as Campbell, Cameron, Maclean in Argyleshire, Macdonald in Inverness, Mackay in Sutherland, Gordon and Forbes in Aberdeenshire, and Scott, Ker, Elliot, Maxwell, and Johnstone on the borders—arises from the clansmen having made a practice of taking the name of their chiefs, considering themselves members of their family by adoption, if not otherwise. Elsewhere than in Scotland, vassals often adopted the names of their lords, and servants those of their masters. Two or more surnames are often borne by one individual, in which case the paternal surname is sometimes placed first, sometimes last; and, in recent times, it is by the name which occurs last that the bearer of the two surnames is most frequently known.

The wife, with us at least, changes her surname to that of her husband on marriage. In the continent, it is not unusual for the husband to append his wife's name to his own; and in Spain, the wife retains her own name, while the son is at liberty to use either paternal or maternal name as he pleases, the choice generally falling on the best family.

The following is a list of the proper names most common in English, with the derivation and original meaning of each:

Aaron (Heb.; Arabic. *Haroun*, or *Harun;* Lat., id.), inspired; lofty.

Abdiel (Heb.; Lat., id.), a servant of God.

Abel (Heb.; Lat., id., or *Abelus*), vanity; transitoriness; emptiness.

Abiathar (Heb.; Lat., id.), father of plenty.

Abiel (Heb.; Lat., id.), father of strength.

STEPHANA (Greek ; Fr. and Ger., *Stephanie*), feminine of STEPHEN (q.v.).
STEPHEN (Greek ; Lat., *Stephanus ;* Fr., *Etienne ;* Ital., *Stefano ;* Span., *Estevan, Esteban ;* Port., *Estevao ;* Ger., *Stephan*), a crown.
SUSAN, SUSANNA, SUSANNAH (Heb.; Fr. and Ger., *Susanne ;* Ital., *Susanna ;* Span. and Port., *Susana*), a lily.
SWITHIN (Ang.-Sax.), a strong friend.
SYLVAN, SYLVANUS, same as SILVANUS (q.v.).
TABITHA (Syrian), a gazelle.
THADDEUS (Syrian ; Lat., id.; Ital., *Taddeo ;* Span., *Tadeo ;* Port., *Thaddeo ;* Ger., *Thaddaus*), the wise.
THEOBALD (O. Ger.; Fr., *Thiebaud, Thiebault ;* Ital., *Teobaldo ;* Span., *Theudabalo ;* Port., *Theobaldo ;* Ger., *Dietbold*), bold for the people.
THEODORA (Greek ; Ger., id.; Ital., *Teodora*), feminine of THEODORE (q.v.).
THEODORE (Greek ; Fr., id.; Lat., *Theodorus ;* Ital., *Teodoro ;* Ger., *Theodor ;* Port. and Russ., *Feodor*), the gift of God.
THEODORIC (Ang.-Sax.; Lat., *Thodoricus*), a ruler of the people.
THEODOSIA (Greek ; Ger., id.; Ital. and Russ., *Teodosia*), a form of THEODORA (q.v.).
THEOPHILUS (Greek ; Lat. and Ger., id.; Fr., *Theophile ;* Ital. and Span., *Teofilo ;* Port., *Theophilo*), a lover of God.
THERESA (Greek ; Port., id.; Fr. and Ger., *Therese ;* Ital. and Span., *Teresa*), carrying ears of corn.
THERON (Greek), a hunter.
THOMAS (Heb.; Lat., Fr., and Ger., id.; Ital., *Tomaso ;* Span., *Tomas ;* Port., *Thomas, Thomaz*), a twin.
THOMASA, THOMASINE (Heb.; Span., *Tomasa ;* Ger., *Thomasia, Thomasin*), feminine of THOMAS (q.v.).
TIMOTHY (Greek ; Lat. and Ger., *Timotheus ;* Fr., *Timothee ;* Ital. and Span., *Timoteo ;* Port., *Timotheo ;* Russ., *Timofei, Timoscha*), honoring God.
TITUS (Greek ; Lat., *Titianus ;* Fr., *Tite ;* Ital. and Span., *Tito*), uncertain ; possibly, safe.
TOBIAH, TOBIAS (Heb.; Lat., Span., Ger., and Dutch, *Tobias ;* Fr., *Tobie ;* Port., *Tobia*), the goodness of Jehovah.
TRISTAM, TRISTIAM (Lat.), pensive ; melancholy ; sorrowful.
TRYHENA, TRYPHOSA (Greek), delicate ; dainty ; luxurious.
TYBALT, a form of Theobald (q.v.).
ULRICA (O. Ger.; Ital., id.; Fr., *Ulrique ;* Ger., *Ulrike ;* Russ., *Ulrika*), rich.
ULYSSES (Greek), a hater.
URANIA (Greek ; Lat., id.; Fr., *Uranie*), feminine of URANIUS (q.v.).
URANIUS (Greek ; Lat., id.; Welsh, *Urien*), heavenly.
URBAN (Lat.; Ger., id., also, *Urbanus ;* Fr., *Urbain ;* Ital., *Urbano*), courteous : polished ; urbane.
URIAH (Heb.), light of Jehovah.
URIAN (Dan.), a farmer ; husbandman.
URIEL (Heb.), light of God.
URSULA (Lat.; Fr., *Ursule ;* Ital., *Orsola ;* Span., *Ursola ;* Russ., *Ursula*), a she-bear.
UZZIAH (Heb.), the might of the Lord.
VALENTINE (Lat.; Fr., Span., and Ger., *Valentin ;* Ital., *Valentino ;* Port., *Valentim*), strong ; healthy ; athletic.
VALERIA (Lat.; Ital. and Ger., id.; Fr., *Valerie*), feminine of VALERIEN (q.v.).
VALERIEN, VALERIUS (Lat., also, *Valerianus ;* Fr., *Valerien, Valere ;* Ital., *Valerio ;* Russ., *Valerij*), same as VALENTINE (q.v.).

VERONICA (Greek; Lat. and Ital., id.; Fr., *Veronique;* Ger., *Veronike*), an exact likeness.

VICTOR (Lat.; Fr. and Ger., id.; Ital., *Vittore*), a conqueror.

VICTORIA (Lat.; Fr., *Victoire, Victorine;* Ital., *Vittoria;* Ger., *Victorie*), feminine of VICTOR (q.v.).

VIDA (Heb.), feminine of DAVID (q.v.).

VINCENT (Lat.; Fr., id.; Ital., *Vincenzio;* Span. and Port., *Vincente;* Ger., *Vincenz*), conquering.

VIOLA (Lat.; Ital. and Ger., id.; Fr., *Violetta;* Span. and Port., *Violante*), like a violet.

VIRGINIA (Lat.; Ital. and Ger., id.; Fr., *Virginie*), virgin; pure.

VIVIAN (Lat.; Ger., id.; Fr., *Vivien*), lively; spirited; vivacious.

VIVIAN (Lat.; Fr., *Vivienne;* Ital., *Viviana*), feminine of Vivian (q.v.).

WALTER (O. H. Ger.; Lat., *Gualterus;* Fr., *Gualtier;* Ital. and Span., *Gualtiero;* Ger., *Walther*), ruling the host.

WILHELMINA (O. H. Ger.; Fr., *Guillelmine, Guillemette;* Ital., *Guglielma;* Span., *Guillemma*), feminine of WILHELM (WILLIAM).

WILLIAM (O. H. Ger.; Lat., *Guilielmus, Guillelmus, Guillermus;* Fr., *Guillaume;* Ital., *Guiglielmo;* Span., *Guillermo;* Port., *Guilherme;* Ger., *Wilhelm*), a defender or protector.

WINFRED (Ang.-Sax.), win-peace, i.e., a lover of peace.

WINIFRED (Ang.-Sax.), feminine of WINFRED (q.v.).

ZABDIEL (Heb.), a gift of God.

ZACCHEUS (Heb.),

ZACHARIAH, ZACHARY (Heb.), remembered by God.

ZADOK (Heb.), just; righteous.

ZEBADIAH, ZEBEDEE (Heb.), a gift from the Lord.

ZEBINA (Heb.) bought.

ZEDEKIAH (Heb.), righteousness of the Lord.

ZELOTES (Greek), a zealot.

ZENAS (Greek), a gift from Jupiter.

ZENOBIA (Greek; Lat., id.; Fr., *Zenobie*), having life from Jupiter.

ZEPHANIAH (Heb.), hid of the Lord.

ZERAH (Heb.), the rising of the sun.

ZILLAH (Heb.), shade; shadow.

ZINA (Heb.), abundance.

Change of Name.—Prior to the reformation, surnames were less fixed than they have since become. Occasionally, younger sons, instead of retaining their patronymic, adopted the name of their estate or place of residence. A great matrimonial alliance was a frequent cause for adopting the patronymic of the wife. With the clergy, ordination was a common occasion of a change of name, the personal surname being exchanged for the name of the place of birth—thus, William Longe became William of Wykeham. In time of political troubles, a new name was often assumed for concealment; and in Scotland, the name of McGregor was proscribed in 1664 by an act of the privy council. In modern times, injunctions in settlements of land, and deeds of entail, are frequent grounds for a change of name, it being made a condition that the devisee or disponee shall assume a certain surname under penalty of forfeiture, a stipulation which the law recognizes as valid. Such an obligation is often combined with one relative to arms. In a Scotch entail, it is a very frequent condition that each succeeding heir of entail, or husband of an heiress of entail, shall assume the entailer's name and arms, or his name and arms *exclusively;* in the former case, he may, if he pleases, continue to use his own surname along with the assumed one. The heir of entail is not held legally to take up any arms not otherwise his own, unless he have applied to the heraldic authorities for leave so to do. Where a Scotch entail contained an injunction to bear arms which had no existence in the official record of arms, the condition has not been held to be null; the heir of entail must apply to the lord lyon for a grant of arms bearing the designation of those disponed. In England, it used to be common to obtain a private act of parliament to authorize one to change his surname; an authority for such a proceeding has generally been given in later times by royal license, which is granted only on a reasonable ground being established for the alteration, to the satisfaction of the kings-at-arms, to whom a remit is made. It has sometimes been supposed that this royal license is necessay to legalize such a change, but the highest legal authorities have laid it down that there is nothing in the law of England to prevent any one, who may consider it for his interest so to do, to change his surname, or even his christian name. The idea, lately prevalent to some extent, is equally erroneous, that an advertisement in a gazette or newspaper, or the execution of some deed, is a necessary form in order to effect a change of name. There are always great inconveniences in changing one's name which sufficiently account for the general indisposition to do so, except from a questionable motive. As there is no law to prevent a person from changing his name, so there is, on the other hand, no law to compel third parties to use the new name, and disputes and annoyances arising from such a state of things are matters of course. The change tends, to a certain extent, to destroy the means of identification after the lapse of years, which may or may not be

the object desired. Notwithstanding these difficulties and inconveniences, there are many examples of persons who have succeeded after a few years in being generally known under a new name, and of the public as well as his friends recognizing it. The change of name, in general, produces no change whatever on the legal status. A party is equally punishable for swindling, larceny, and other cognate offenses, whatever name he uses; and, on the other hand, if he is legatee, he is not prevented from establishing and receiving his legacy, whatever name he has adopted. It follows from what precedes that no person is punishable for using a new name, though it is sometimes an ingredient for a jury to take into consideration when they are required to infer a particular motive of conduct. The royal license is practically required to be obtained by Englishmen (not Scotchmen) holding commissions in the army, as also when the change of name is to be accompanied by a change of arms, it being the practice of the English heralds' college to refuse to grant arms corresponding to such change, unless the royal license have been obtained. In Scotland a *bona fide* change of name requires neither royal, judicial, nor parliamentary authority, the sole exception being the case of members of the college of justice, who require the permission of the court of session. A royal license is not generally applied for by natives of Scotland, as it is not required to be produced to the lord lyon on applying for a corresponding change of arms. The arms will generally be granted when the lord lyon is satisfied that the change has been made on some reasonable ground, and not from a purely capricious motive; and the fact of the change of name, with the reason why it has been made, are narrated in the new patent of arms. When such change of surname and corresponding change of arms has been made by a Scotsman who is an officer in the army, the authorities of the war office are in the habit of requiring a certificate from the lyon office to the effect that the change is recognized there.

Names of Places.—These, like names of persons, belong, in a great measure, to the language of past races. All over Great Britain, a very large proportion are derived from the Celtic names for natural features of the country. From *gwysg, afon, tam, tav, cluyd* —in the Celtic speeches equivalent to *water* or *river*—we have Esk, Avon, Wye, Thames, Tavy, Clyde. *Pen* or *ben*, hill, gives rise to the names of hills in England and Wales (Penrhys, Penzance), and still more in Scotland (Ben Nevis). So, also, *cwm, comb*, valley —as in Cumberland, land of valleys. The memory of the Roman invasion has been preserved in the termination *chester* (derived from *castra*) in the names of towns, as Manchester. Though surnames often originated in local names, the reverse process also occurred; as where *ville, ton* or *ington, ham*, or *burgh*, has been appended to the name of the owner of the land, e.g., Charleville, Johnston, Wymondham, Edinburgh (i.e., Edwin's burgh).

See Yonge, *History of Christian Surnames* (1863); Lower, *English Surnames* (1849); Bardsley, *Curiosities of Puritan Nomenclature* (1880); Cocheris, *Les Noms de Lieu* (1882); Taylor, *Words and Places* (1885); Blaikie, *Dictionary of Place-Names* (1885).

NAME IN LAW. It is well settled in the United States that no process of law is necessary to effect a change of name. The reason is seen in the fact that names are not originally given by the law, but are established by usage. Thus the foundling named by the first-comer has, from every legal point of view, as good a right to that name if commonly applied to him during his youth as if he had been christened by the highest ecclesiastical authority. Again, a change of name can in any event have but little legal significance; for, if John Doe signs a conveyance as Richard Roe, he cannot void the agreement on that ground; or, if he so signs a bond, he will be estopped from setting it up as a defense. Where the maker of a will has for many years gone under a name not that given to him by his parents, and signs the will in the assumed name, the instrument will not on that ground be set aside. So, in criminal practice, it is of no moment under what name the accused is indicated in a warrant, identification being the only requisite. Nevertheless, the legislatures of the different states have provided a legal process by which a change may receive legal sanction. In New York, application must be made to the county court, or, in New York city, to the common pleas, by petition, stating the grounds of the desire to change, and after due notice and publication an order is granted authorizing the use of the new name. In Massachusetts the application must be to the legislature; other states require application to the probate or surrogate's court.

NAMES OF PARTIES. See PARTY NAMES.

NAMING A MEMBER. It is one of the customs of the English House of Commons for the speaker to announce publicly the name of any member who, after having been called to order, persists in disregarding the rules of the House. He is left to the censure of the members, and public opinion requires his immediate withdrawal from the floor. This is termed Naming a Member.

NAMUR', a province of Belgium, bounded on the n. by Brabant and Liege, e. by Luxemburg, w. by Hainault, and s. by France. Area, 1414 sq. miles. Pop. Dec. '95, 344,323. The principal rivers are the Meuse—which entirely intersects the province —the Sambre, and the Lesse. Namur presents generally an alternation of fruitful valleys and low hilly tracts; but in some parts, where the heights constitute offshoots of the Ardennes and are densely wooded, they attain a considerable elevation. With the exception of the land in the s.w., where there are large tracts of bog and heath, the soil is extremely rich, yielding abundant crops and fine pasture. The chief products

of Namur are wheat, oats, hops, oil-yielding plants, and flax. Besides iron, copper, lead, and coal mines, Namur has marble and slate quarries, and yields sulphur, alum, cadmium, alumina, flints, etc. It has good steel, iron, and smelting works, breweries, paper-mills, etc. Namur is divided into the three arrondissements of Namur, Dinant, and Philippeville. At the close of the 12th c., Namur was united to Luxembourg, after having existed as an independent countship for upwards of 150 years. Towards the middle of the 13th c., it passed by purchase to the house of Flanders, which retained possession of it till 1420; when, on the death of count John III., without direct heirs, the countship, which was in a state of extreme financial embarrassment, was purchased for 132,000 gold ducats, by Philip the good, duke of Burgundy, and subsequently shared the fate of the other Burgundian states.

NAMUR (Flem. *Namen*), the chief t. of the province of the same name, is situated at the confluence of the Sambre with the Meuse, and is a strongly fortified town and the seat of a bishop. Pop. '95, 31,938. Among its many churches, the cathedral, or St. Aubin's, which was consecrated in 1772, is one of the most beautiful churches of Belgium. Namur has an academy of painting, a conservatoire for music, two public libraries, a museum, a hospital for aged paupers, a theological seminary, and 2 colleges, one conducted by Jesuits. The present citadel was constructed in 1784, but the city has been fortified from the earliest period of its history; and in 1691 its defensive works were repaired and strengthened by Coehoorn, only, however, to be taken the following year by Louis XIV. and Vauban, the latter of whom added considerably to its original strength. The citadel was taken by the English and French in 1695 (see Sterne's *Tristram Shandy*), and after having been gallantly defended by its French conquerors in 1815, against the Prussians under Pirch, it was finally restored to the Netherlands after the battle of Waterloo, and at once put into thorough repair. Namur is noted for its cutlery, its leather-works, and its iron and brass foundries.

NAN'AK, or NÂNEK. See SIKHS.

NA'NAS, a t. of Hungary, in the midst of extensive morasses, 20 m. s. of Tokay. The population, partly Protestant and partly Roman Catholic, is employed in cattle husbandry and agricultural pursuits. Pop. '90, 14,457.

NANA SAHIB, a Hindu, one of the leaders of the sepoy revolt of 1857. He is said to be the son of a Brahman from the Deccan, and his real name was Dhundu Punt. He was b. about 1820, and was adopted as a son in 1827 by Bajee Rao, the childless ex-peishwa of Poona, thereby, according to Hindu law and custom, acquiring most of the rights of a legitimate son. He was educated as a Hindu nobleman—taught English, and brought much in contact with the European officers, in whose amusements he seemed fond of participating. A decision was, however, come to by the government of Calcutta, that they should not recognize rights to pensions or indemnities acquired by adoption; and in consequence, Nana Sahib was refused the continuance of a pension of eight lacs of rupees, paid to his adopted father under a treaty made in 1818. This is believed to have rankled in his mind, along with slights he received from the supercilious English youth with whom he came in contact. He was allowed to retain some of the state of a native prince—a retinue of 200 soldiers, with 3 field-pieces, and a fortified residence at Bithoor, 10 m. w. of Cawnpore. When the mutiny broke out in May, 1857, he offered to assist the English, but instead he treacherously placed himself at the head of the mutineers. The European troops were induced, on June 25, to capitulate to Nana Sahib, who promised they should be sent down the Ganges in safety. They got on boats provided for them, but had no sooner done so than two guns were unmasked, and a murderous fire was opened upon them. The sepoys were ordered to shoot the men, but to spare the women and children, who, when their husbands and parents had been shot, were removed to a house in Cawnpore. On July 15, sir H. Havelock, who had advanced to their assistance from Allahabad, defeated the sepoys in two engagements, one within 8 m. of Cawnpore; and Nana Sahib next day directed that the women and children should be put to death, an order carried out with unparalleled atrocity. A long series of engagements against Nana Sahib followed, in which he was always the loser, and he was ultimately driven beyond the English frontier into Nepaul. In 1860 his death was announced, but, two years later, new movements were discovered, which were attributed to him, and it is not certainly known whether he is dead or alive. Several persons have been arrested on suspicion of being Nana Sahib, but in all cases a mistake has been made.

NANCE, a co. in n. interior of Nebraska; formed, 1879, from the former Pawnee Indian reservation. Pop. '90, 5773. Area, 436 sq. m. Co. seat, Fullerton.

NANCY, a beautiful t. of France, capital of the department of Meurthe-et-Moselle, is situated on the left bank of the river Meurthe, at the foot of wooded and vine-clad hills, 220 m. e. of Paris, on the Paris and Strasburg railway. The population, which has increased by immigration from Alsace after that province was ceded to Germany was in '96, 96,306. It is divided into the old and new towns (the former irregular and with narrow streets, the latter open and handsome), and comprises also two suburbs. It contains many handsome squares and imposing edifices, and owes much of its architectural ornamentation to Stanislaus Leczinsky, who continued to reside here till his death in 1766. His statue stands in the place Royale, a fine square, surrounded by im-

portant public buildings, as the hôtel de ville, theater, etc. Nancy is the center of one of the two French hypnotic schools. Among the institutions are the university-academy, the normal school, the school of medicine, the lyceum, the public library with 70,000 volumes, and a noted school of forestry. Cotton, woolen, and linen manufactures are carried on; but the principal branch of industry is the embroidering of cambric, muslin, and jaconet goods. Nancy is known to have existed in the 11th century. Two centuries later, it became the capital of the duchy of Lorraine (q.v.). Charles the Bold was killed while besieging Nancy in 1477.

NAND'IDÆ, a family of fishes found in the fresh waters of India, containing three genera, *badis, nandus,* and *catopra.* They resemble the basses and sunfishes of America.

NAN'DU, or AMERICAN OSTRICH (*rhea*), a genus of South American birds allied to the ostrich, cassawary, and emu, and most nearly to the ostrich, from which it differs in having the feet three-toed, and each toe armed with a claw; also in being more completely feathered on the head and neck; in having no tail; and in having the wings better developed and plumed, and terminated by a hooked spur. The wings are, indeed, better developed than in any other of the *struthionidæ,* although still unfit for flight. The neck has 16 vertebræ. There are at least three species. The best known species (*R. Americana*) is considerably smaller than the ostrich, standing about 5 ft. high. It is of uniform gray color, except on the back, which has a brown tint. The male is larger and darker-colored than the female. The back and rump are furnished with long feathers, but of a more ordinary kind than those of the ostrich. This bird inhabits the great grassy plains of South America, southward of the equator, abounding on the banks of the La Plata and its more southern tributaries, and as far s. as lat. 42° or 43°. Its range does not extend across the Cordilleras. It is generally seen in small troops. It runs with great celerity, using its wings in aid. It is polygamous, one male securing possession of two or more females, which lay their eggs in a common nest, or drop them on the ground near the nest, to which the male rolls them. Contrary to the usual habit of birds, incubation is performed by the male. The Nandu is shy and wary, but is successfully hunted by the Indians, generally on horseback. The flesh of the young is not unpleasant. The Nandu is capable of being domesticated.—A smaller and more recently-discovered species (*R. Darwinii*) has light-brown plumage, each feather tipped with white. It inhabits Patagonia. A third species (*R. macrorhyncha*) is distinguished by its large bill See illus., OSTRICH, ETC., vol. XI.

NANKEEN' CLOTH. Calico of the kind called "nankeen," or nankin, was formerly imported extensively from China to Europe, and said to be the manufacture of Nanking; the color, a yellowish-buff, being a favorite one. It was supposed that the Chinese held a secret for dyeing this color, which was found to be remarkably durable; but it became known that it was not an artificial color at all, the cloth being made of a colored variety of cotton, which was produced occasionally in China and India.

NANKING' ("the southern capital"), capital of the province of Kiangsu, formerly the capital of China, on the Yangtse-Kiang river, 130 m. from its mouth, n. lat. 32° 40′ 40″, e. long. 118° 47′. Since the removal of the seat of government to Peking (northern capital) it has been called by the Chinese Kiangning-fu. The walls inclose an area of nearly 20 m. in circumference, the greater part of which, however, is entirely waste. They reach in many places an elevation of 70 ft., and are fully 30 ft. in thickness at the base. The ancient walls of the original capital have been traced for 35 miles. According to Chinese accounts, the population of Nanking under the Ming dynasty was once 4,000,000, but it is now estimated variously at from 150,000 to 400,000 including about 50,000 Mohammedans. As the city, however, has passed through so many vicissitudes, it is impossible to ascertain its present number of inhabitants. The inhabited portion of the walled area lies toward the west, and several miles from the bank of the river. It is no longer possible to speak of Nanking in the language which former travelers used, although Nanking still ranks as the literary capital of China and contains many large libraries and printing shops. The barbaric desolations to which it was subjected during the Tae-ping rebellion left it a sort of wreck, and one can only describe it as it was, before the victorious assault of the rebels, Mar. 19, 1853. Nanking is the seat of the vice-regal government for the provinces grouped together under the name of Kiangnan. Here, as elsewhere in China, there was, and again is, a Manchu garrison, or military colony, separated by a wall from that portion of the city which is occupied by the Chinese. Some of the finest streets of Nanking were in the Tartar city; several being nearly 40 ft. wide, having a space in the middle of about 8 ft. in width, flagged with well-hewn blocks of blue and white marble, and on each side of this a brick pavement 14 ft. or more wide. A deep canal or ditch runs from the river directly under the walls on the w., serving to strengthen the defenses of the city on that side. The ancient palaces have all disappeared. The offices of the public functionaries were numerous, but, like the shops, presented the general features common to all Chinese towns. The objects most worthy the inspection of the traveler are found, in ruins, outside the precincts of the modern city. Among these is the summer palace of the emperor Kienlung. It consisted of a number of one-story buildings, with spacious courts between, and flanked by smaller buildings on the sides. Enough still remains to show that the workmanship was of the most elaborate and unique character. When under cultivation, the spot must have been exceedingly beautiful. The tombs of the kings are remarkable for their sepulchral statues, which form an avenue leading up to the graves; they consist of gigantic figures, like warriors cased in a kind of armor, standing on either side of the road, across which, at intervals, large stone tablets are extended,

supported by huge blocks of stone instead of pillars. Among the buildings totally destroyed by the rebels was the far-famed Porcelain tower, 260 ft. high. It was erected by the emperor Yungloh, to reward the kindness of his mother; the work was commenced in the 10th year of his reign (1413), at noon, on the 15th day of the moon, in the 6th month of the year, and was completed in 19 years. The board of works was ordered, according to the plan of the emperor, to build a tower 9 stories high, the bricks and tiles to be glazed, and of "fine colors," and it was to be superior to all others, in order to make widely known the virtues of his mother. Its height was to be 322 feet. The ball on its spire was to be of brass, overlaid with gold, so that it might last for ever and never grow dim. Encircling the spire were 9 iron rings, the largest being 63 ft. in circumference, and the smallest 24 ft., altogether weighing nearly 5,000 pounds. In the bowl on the top were deposited one white shining pearl, one fire-averting pearl, one wind-averting pearl, one water-averting pearl, one dust-averting pearl, a lump of gold weighing 50 ounces, a box of tea-leaves, 1000 taels of silver, one lump of orpiment, altogether weighing 4,000 pounds; one precious stone- gem, 1000 strings of copper coin, two pieces of yellow satin, and four copies of Buddhist classics. Nanking continued in possession of the Tae-ping rebels till the successes of the troops under maj. Gordon had crushed one after another all their outlying forces, when at length, July 19, 1864, the city was stormed by the imperialist soldiers under the viceroy Tseng Kwo-fan. The last blow was thus dealt to the Tae-ping rebellion, whose principal leader perished by his own hand amid the blazing ruins of the palace he had occupied for 11 years. Since its recapture, Nanking has resumed its former position as the seat of the vice-regal government, but shows few signs of revival from its desolation. It has, however, been made the headquarters of a large military force, and also of an arsenal for the manufacture of cannon and other warlike stores on the European model. The historical treaty of 1842 was signed at Nanking. Although specified in the treaty of Tientsin (1858) as a river-port to be opened, little or nothing has come of this concession, and but few foreigners are resident in Nanking, the climate being very malarious to strangers on account of the surrounding marshes. Cotton grows abundantly near Nanking, and the yellow cloth made from it is called nankeen.

NANSEN, Fridtjof, ph.d., Arctic explorer; b. in Christiania, Norway, Oct. 10, 1861. took a partial course at the university of Christiania; made his first expedition to the Arctic regions in 1882; became curator of the Natural history museum at Bergen on his return; made a notable journey to Greenland in 1888–9; appointed curator of the museum of comparative anatomy, university of Christiania; and in 1893–96 traversed the Polar sea to lat. 86° 14′ n., nearly 4° further n. than Greely went, and saw no land n. of lat. 82°. The expedition was remarkably successful, and all who took part in it returned in safety and good health. In 1897 Nansen went on a lecturing tour in the United States. His publications include *Across Greenland* and *Farthest North* (1897). The latter is a record of Nansen's voyage in 1893–6 in the ship "Fram," including an account of his fifteen months voyage on the ice in company with Lieutenant Johansen. Nansen's theory was that the ship would be carried straight across the Polar sea by the movement of the drift ice. They left the "Fram" on their sledge expedition on March 14, 1895, and after penetrating to a point within 4° of the Pole, returned southwards, reaching Franz Josef Land in the following summer. In the meantime the "Fram" had been carried across the Polar sea, at first taking a northwesterly course and reaching a point at nearly as high a latitude as that attained by Nansen and Johansen, then, varying to the southwest, it broke itself free from the ice north of Spitzbergen whence it returned to Norway. According to Nansen, the expedition has proved that the sea in the immediate neighborhood of the Pole, and in which he believes that the Pole itself lies, is a deep basin extending a long way north of Franz Josef Land and eastward to the New Siberian islands.

NANSEMOND, a co. in s.e. Virginia, adjoining North Carolina; bounded on the n. by Hampton Roads, drained by Nansemond river and its branches, and crossed by the Atlantic Coast line, the Seaboard air line, and several other railroads; 400 sq. m.; pop. '90, 19,692. Co. seat, Suffolk.

NANTAS'KET, a narrow peninsula in Massachusetts that extends from Cohasset township into Massachusetts bay about five miles. The town of Hull is situated on it, about 9 m. by water and 22 by railroad from Boston. It is a popular summer resort, and has several hotels of great size.

NANTES (anc. *Namnetes* or *Nannetes*), an important seaport t. of France, capital of the department of Loire-Inférieure, is situated on the right bank of the Loire, here 2000 yards wide, and at a point of confluence with it of the Erdre and the Sèvre-Nantaise, both navigable streams. Besides railways, there is communication with the interior by steamers on the Loire. The natural beauties of the site have been much improved by art, and now the noble river on which the town is placed, covered with craft of every size and description, the islands that stud its channel, the meadows that skirt its banks, and the bridges (upwards of 16 in number) that cross it and its tributaries here, combine to make the scene a highly picturesque one. Nantes contains numerous squares and churches. Several districts of the town are nearly as fine as the best districts of Paris, the old town having been pulled down between 1865 and 1870. This town possesses numerous striking and beautiful buildings, among which the cathedral of St. Pierre, containing the splendid monument of Francis II., the last duke of Bretagne, and of

Marguerite, his wife, and the old castle, built in 938, are the chief; it was here that in 1598 Henry IV. signed the famous edict of Nantes. There is a public library containing 200,000 vols.; a museum of paintings; and a museum of natural history. The quays, lined on one side with houses, and in some cases planted with trees, afford an agreeable and interesting promenade of about 2 m. in length. The most beautiful promenade, however, formed by the Cours St. Pierre and the Cours St. André, extends from the Erdre to the Loire. It is planted with four rows of trees, bordered with lines of palatial houses, and ornamented with statues. On the right bank of the river there are 7837 ft. of quayage. Vessels of no more than 200 tons can reach the port, but vessels of greater burden unload at Paimbœuf, or St. Nazaire. A ship canal on the left bank now admits large sailing vessels and steamers directly to Nantes. The chief exports of Nantes are varieties of linen and cotton fabrics, calicoes, flannels, machinery, soap, preserved vegetables, fish, refined sugar and salt, chemical products, cordage, etc. It contains tan-yards, copper foundries, brandy distilleries, etc., but the ship-building, formerly important, has been falling off since the rise of St. Nazaire. Pop. '96, 123,902.

NANTES, EDICT OF, the name given to the famous decree published in that city by Henri IV. of France, April 13, 1598, which secured to the Protestant portion of his subjects freedom of religion. Among its more important provisions were—liberty to celebrate worship wherever Protestant communities already existed; to establish new churches, except in Paris and the surrounding district, and in the royal residences; and to maintain universities, or theological colleges, of which they had four, those at Montauban, Saumur, Montpellier, and Sedan; adherents of the reformed faith were also to be eligible to all civil offices and dignities; but, on the other hand, they were not allowed to print books on the tenets of their religion, except in those places where it existed; and they were obliged to outwardly celebrate the festivals of the Catholic church, and to pay tithes to the Catholic priesthood. From this period, the Reformers or Huguenots (who then counted 760 churches) had a legal existence in France, but gradually their political strength was crushed by the mighty genius of Richelieu—who, however, never dreamed of interfering with their liberty of worship. Neither did his successors, Mazarin and Colbert; but under the influence of a "penitence," as corrupt and sensual as the sins which occasioned it, Louis XIV., after a series of detestable *Dragonnades* (q.v.), signed a decree for the revocation of the edict, Oct. 18, 1685. The result of this despotic act was that, rather than conform to the established religion, 400,000 Protestants —among the most industrious, the most intelligent, and the most religious of the nation —quitted France, and took refuge in Great Britain, Holland, Prussia, Switzerland, and America. The loss to France was immense; the gain to other countries, no less. Composed largely of merchants, manufacturers, and skilled artisans, they carried with them their knowledge, taste, and aptitude for business. From them England, in particular, learned the art of manufacturing silk, crystal glasses, and the more delicate kinds of jewelry.

NANTUCKET, island, county, and co. seat, in Mass. The island is in the Atlantic ocean about 30 miles s. of Barnstable co.; is separated from Martha's Vineyard by the Muskeget channel; is triangular in shape, about 15 miles long and 3–4 wide; and with several outlying islands has an area of about 60 sq. miles. The town and co. seat contains a number of villages, the Nantucket Athenæum (library), high school, national and savings banks, Coffin academy, gas and electric light plants, waterworks supplied from Wanacomet pond, and several churches. Steamers connect the island with Wood's Hole (30 miles) and New Bedford (60 miles). The island at one time was one of the great seats of the whaling industry, and in 1775 had about 150 vessels engaged therein; but for many years this industry has been extinct, and the people are principally engaged in the cod fishery and the coasting trade. The island is a widely esteemed summer resort, particularly recommended for persons suffering with nervous prostration. Pop. town, '90, 3,268. See Godfrey's *Nantucket* (1894).

NANT'WICH, parish and market t. of Cheshire, England, on the Weaver, 20 m. s.e. of Chester. Many of its houses are interesting from their age and construction, being built, in many cases, of timber and plaster, and with overhanging upper stories. The parish church, one of the finest country churches in England, was thoroughly restored in 1864 at great cost. Nantwich was famous in former times for its brine-springs and salt-works. Shoes, gloves, and cotton goods are manufactured, and malting is carried on. Pop. 1891, 7412.

NA'OS (Gr. a dwelling), the cell or inclosed chamber of a Greek temple.

NAPA, a co. on the coast of California, n. of San Pablo bay; drained by Napa river and Putah creek; 850 sq. m.; pop. 16,411, a part of which are Chinese. It has fertile valleys, and a range of mountains. The principal mountain is St. Helena, situated at the head of Napa valley, which rises 4,343 ft. above the sea. In the co. is a wonderful forest of petrified trees of large size, also springs of sulphur and borax, and a cinnabar or quicksilver mine. The leading products are wool, grain, butter, and wine. It is traversed by the Southern Pacific railroad. Co. seat, Napa.

NAPH'THA, is derived from the Persian word *nafata*, to exude, and was originally applied to an inflammable liquid hydrocarbon (or rather a mixture of several hydrocar-

bons) which exudes from the soil in certain parts of Persia. (According to Pelletier and Walter, it consists of three hydrocarbons—viz., C_7H_{14}, which boils at 190° F. (87.7°C.); C_8H_{16}, which boils at 239° F. (115° C.), and $C_{12}H_{24}$, which boils at 374° F. (190° C.). The term is, however, now used not only to designate a similar and almost identical fluid, that issues from the ground in many parts of the world, and is known as petroleum, rock-oil, etc., but is also applied to other liquids which resemble true naphtha in little else than their volatility and inflammability. Thus, wood-spirit, or methylic alcohol, is often spoken of as *wood-naphtha*, and acetone is sometimes described as naphtha. Coal-tar yields by distillation a liquid which has a heavier specific gravity and a lower boiling-point than Persian naphtha, but resembles it in general properties, and can generally be substituted for it for some purposes. See GAS-TAR.

Crude naphtha, whether occurring as a natural product or as obtained from coal-tar, is purified by agitation with strong sulphuric acid; after which it must be well washed with water (in which it is quite insoluble), and finally distilled from quicklime. Pure naphtha is colorless, and of a peculiar taste and odor; it is soluble in about eight times its bulk of alcohol, and dissolves in all proportions in ether and in essential oils. Hot naphtha dissolves phosphorus and sulphur, but deposits them on cooling. It is an excellent solvent for gutta-percha, caoutchouc, camphor, and fatty and resinous bodies generally; and hence it is extensively used in the arts for these purposes, and its employment as a source of artificial light is now becoming universal. In consequence of its containing no oxygen, it is employed by chemists for the preservation of potassium and other metals, which have a powerful affinity for oxygen. Owing to its volatility and inflammability, it must be handled with great caution, many fatal cases having arisen from its vapor catching fire on the approach of a candle.

The principal kinds of naphtha known in commerce are native naphtha, coal naphtha, Boghead naphtha (also called paraffin oil and photogen), shale naphtha, and naphtha from caoutchouc and caoutchine.

Native naphtha, petroleum, or rock-oil is found in many parts of the world, as in Japan, Burmah, Persia, the shores of the Caspian sea, Siberia, Italy, France, and North America. It is of various degrees of consistency, from a thin, light, colorless fluid found in Persia, with a specific gravity of about 0.750, to a substance as thick as butter, and nearly as heavy as water. But all the kinds when rectified have nearly the same constitution. They contain no oxygen, and consist of carbon and hydrogen compounds only. Bitumen and asphaltum are closely allied substances in a solid or semi-solid form. From a very early period in Persia and Japan, and at least since last century in Italy, native naphtha has been used to burn in lamps.

Coal-tar naphtha (see GAS-TAR), as stated above, is of a higher specific gravity than native naphtha—viz., from 0.860 to 0.900, and has a more disagreeable and penetrating odor.

Paraffin oil, for some time known also as Boghead naphtha, has become, of late years, so important a manufacture that a brief history of its origin cannot be uninteresting. In the year 1847 Mr. James Young, of the chemical works at Bathgate, had his attention called to a petroleum spring at Alfreton, in Derbyshire, from which he distilled a light thin oil for burning in lamps, obtaining at the same time a thicker oil, which was used for lubricating machinery. After a year or two the supply began to fail, but Mr. Young, noticing that petroleum was dropping from the sandstone roof of a coal-mine, conjectured that it originated by the action of heat on the coal-seam, the vapor from which had condensed in the sandstone, and supposed from this that it might be produced artificially. Following up this idea, he tried a great many experiments, and ultimately succeeded, by distilling coal at a low red-heat, in obtaining a substance resembling petroleum, which, when treated in the same way as the natural petroleum, yielded similar products. The obtaining of these oils and the solid substance paraffin from coal formed the subject of his now celebrated patent, dated Oct. 17, 1850.

In the years 1860 and 1864 long and costly litigations as to the validity of Mr. Young's patent took place in Edinburgh and London, resulting in the main in his favor. Many years ago Reichenbach had, by distilling 100 lbs. of pit-coal, obtained nearly 2 oz. of an oily liquid exactly resembling natural naphtha; and various other chemical writers were appealed to, as proving that methods substantially the same as Mr. Young's were previously known and practiced. One thing seeme to have been admitted, that previous to his patent no one had succeeded in producing the oil on a commercial scale.

The processes by which the oil and paraffin are obtained are simple. The material best adapted for the purpose was for years believed to be Boghead coal, a very rich gas-coal, occurring in a field of limited extent near Bathgate, in Linlithgowshire. All cannel coals, however, give the same products, and some of them in nearly as large quantity; but, as stated below, shale is now generally used and treated in the same way. The coal is broken into fragments like road-metal, and gradually heated to redness in cast-iron retorts, which are similar to those used for coal-gas (see GAS). The retorts are most usually upright, about 10 ft. long and 14 in. in diameter at the bottom, tapering to 12 in. at the top, and built in sets of 3, 4, or 6, so that one fire may heat each set. The coal is fed by means of a hopper on the top of the retort, and after passing through it at a low red-heat, is drawn out as coke at the bottom, where there is a water lute to prevent the escape of oil or gas. There is a spherical valve in the hopper, counterpoised

with a weight, which closes the retort at the top. The volatile matters distilled from the coal are conducted by a pipe to the condensers (similar to those used for coal-gas), where they are condensed into a thick black oil, of a specific gravity of about 0.900, along with a little water. Great care is necessary to prevent the heat from becoming too high, because gas and gas-tar, and not paraffin oil, are obtained when coal or shale is distilled at a high temperature. A ton of Boghead coal gave about 120 gallons of crude oil.

The crude oil from the first distillation is then distilled again in long cylindrical malleable-iron stills. From this second distillation a "green oil" is obtained, and the residue is removed as coke from the bottom of the still. This oil is then mixed with from 5 to 10 per cent of sulphuric acid, and afterwards with about the same quantity of soda, the mixtures being made in circular tanks with revolving stirrers. Both the acid and the soda mix with impurities, which fall to the bottom as heavy tarry matters, and are run off by a stop-cock, till only the clear supernatant oil remains. After being so far purified, the oil undergoes three further distillations, being at the same time treated with strong acid (1 per cent) and soda. The final result is that a small quantity of light naphtha is obtained in the later distillations, three-fourths of what is left being a light and nearly colorless oil used for burning in lamps, and the remainder a thicker oil containing paraffine. This latter portion is pressed in a hydraulic press, which squeezes out the greater portion of the paraffine, leaving an oil which is sold for lubricating machinery.

The crude paraffine, after being subjected to hydraulic pressure three or four times, is chiefly purified, by repeated crystallizations, from naphtha. Steam is afterwards blown through it in a melted state, and when finally treated with 3 per cent of animal charcoal it is an exquisitely beautiful substance, resembling the purest white wax. It is largely manufactured into candles, which equal, or even excel, in appearance those made from wax, and are only about half as costly. Paraffine has now a number of curious minor applications.

Shale naphtha, or "shale-oil," is a substance which has been manufactured, for many years, from bituminous shales, both in England and on the continent. Partly because the Boghead coal has become practically exhausted, but chiefly because the volatile products from it are more easily purified than from any coal, beds of bituminous shale found in the carboniferous formation are now almost entirely used in Scotland as the raw material from which paraffine oil and paraffine are obtained. Previous to 1856 these shales were turned to no account. See Shale.

Naphtha from caoutchouc, or caoutchine, is obtained from caoutchouc by destructive distillation. In composition it consists mainly of hydrocarbons, having the same proportion of carbon to hydrogen as india rubber. Caoutchine has the reputation of being one of the best known solvents for india rubber.

Until the discovery of the Pennsylvanian, the Burmese (Rangoon) petroleum, or rock-oil, was one of the best known. It is obained in a treacly state by sinking wells about sixty feet deep in the soil, and consists of several fluid hydrocarbons, with about ten or eleven per cent of the solid hydrocarbon paraffine. The different naphthas it contains are highly prized as burning and lubricating oils, and for removing greasy stains, on account of their agreeable smell. The naphtha which is found abundantly at Baku, on the shores of the Caspian sea, closely resembles the Rangoon in its qualities. The Persian naphtha is frequently pure enough for burning without rectification.

Prominent among the wonders of our time, however, as regards new fields of industry and wealth, stand the discoveries of the naphtha, or, as they are called, the petroleum regions of the United States. Some of these sources of native naphtha were known to the Indians, by whom it was at one time collected for sale; but it is little more than twenty years since, by sinking deep wells, the great extent of the oil-bearing strata became known. The principal supplies are obtained in Pennsylvania, West Virginia and Ohio, a considerable quantity being also obtained in west Canada. Other regions in North America produce it, but the Pennsylvanian yield is six or seven times greater than all the rest put together. Consul Kortright, in his report on the states of Pennsylvania, Ohio, etc., for 1870 and 1871, says: "The oil regions are 100 miles in length by 30 to 50 in breadth, and the number of wells to be tapped so great that the supply is considered to be sufficient for a century to come at least."

Much curiosity exists respecting the origin of these great natural sources of petroleum. It seems to be the general opinion of geologists that it has in most cases been produced by the decomposition of both vegetable and animal matters. In this respect it differs from coal, which has arisen from the decay of vegetable matter alone. It would appear that the Pennsylvanian oil proceeds from shales of carboniferous age; the Canadian from those of Devonian age. In both countries the oil is found in cavities in sandstone, and has therefore been derived from subjacent rocks. It is now known that petroleum has formed in rocks of nearly all geological ages. Prof. Dana, the American mineralogist, says that the conditions favorable to the formation of native naphtha, as shown by the characteristics of the deposits in which it is found, are: (1) the diffusion of organic material through a fine mud or clay; (2) the material in a very finely divided state; and (3), as a consequence of the preceding, the atmosphere excluded as far as possible from the material undergoing decomposition.

In Pennsylvania the first borings for petroleum took place in 1859, and in that year

82,000 bbls (reckoned at 43 galls. each) were obtained; in 1861 the produce had reached 2,000,000 bbls.; and since then, as a rule, it has increased from year to year. In 1872 the total produce of North America was 7,394,000 bbls.; Canada furnishing 530,000 bbls. In the year 1884 the total exports from the United States of petroleum amounted to over 24,019,750 bbls., an enormous quantity, considering the first exports took place so recently as 1861. Of late years the petroleum trade is said to have employed in North America as many hands as coal-mining and the working of iron. See OIL WELLS.

In 1862 and 1871 acts of parliament were passed limiting the amount of petroleum to be kept in store, and regulating the sale of such kinds as give off an inflammable vapor below 100° F. There are special warehouses for the reception of petroleum at the London and Liverpool docks.

Terrible accidents have now and then happened with some of the more inflammable American oils, by reason of their vapors exploding in the reservoirs of lamps. Most of these have, no doubt, taken place with oils whose vapors form an explosive mixture with air at a temperature below 100° F., but they can hardly be considered safe if their vapors will take fire on the approach of a light at less than 120° F. The vapor of the paraffine oil prepared for illuminating purposes by Young's mineral oil company, and no doubt by other firms, from Scotch shale, will not form an explosive mixture below 120° F., and it is therefore quite safe. Since this oil has to compete with petroleum, such a standard can only be kept up at a loss, and there is therefore a great temptation to keep down the firing-point of these burning oils as low as possible, with a view to greater profit; and although accidents have happened with paraffine oil, as well as with American petroleum, there is little doubt that the latter cannot be so thoroughly relied upon for safety. It could easily be made so, however, if the lighter hydrocarbons which it contains were carefully removed.

NAPHTALI, TRIBE OF, named after a son of Jacob, recorded as numbering 53,400 adult males at the exodus, being then the 6th in numbers among the 12 tribes. On its arrival at the outskirts of Palestine, it was only 8th in number. In the journey through the wilderness its place was n. of the tabernacle, near the tribes of Dan and Asher, with which it constituted the "camp of Dan." The ensign of the three is represented by the Jewish legends as a serpent, bearing the inscription "Return, O Jehovah! unto the many thousands of Israel." The territory allotted to Naphtali was situated in n.e. Palestine, bounded on the n. by the Leontes river, on the e. by lakes Galilee and Merom, and the Jordan, on the s. by the Zebulun, and on the w. by Asher. It included the w shore of the sea of Galilee. Its surface and scenery were more diversified than those of the other tribes. Its s. portion, and especially the plains along the shore of the sea of Galilee were the most fertile region of Palestine. The tribe of Naphtali, under the leadership of Barak of Kedesh-Naphtali, repelled the invasion of the Canaanites under Sisera and Jabin (Judg. x.), and their valor is extolled in the song of Deborah. In the reign of Solomon, Naphtali was under the charge of Ahimaaz, his son-in-law. The head of the tribe in David's time was Jerimoth ben Azriel. In the reigns of Asa, king of Judah, and Baasha, king of Israel, Benhadad, king of Syria, "sent the captains of the host which he had, against the cities of Israel, and smote all Cinneroth, with all the land of Naphtali" (I. Kings, xv. 20). About 730, Tiglath Pileser ravaged n. Palestine and carried off the population to Assyria, and the history of the tribe ends at this point.

NAPHTHALIC GROUP or **SERIES.** The starting point of the group is *Naphthalene*, $C_{10}H_8$, a substance of great interest in the history of organic chemistry, from its being that upon which Laurent chiefly founded his theory of substitutions. It may be obtained in various ways, but is most easily and abundantly produced from the last portions of the distillate of coal-tar, which become semi-solid on cooling. The liquid part of this mass is got rid of by pressure, and the naphthalin is then taken up by hot alcohol, from which it is obtained in a pure state by crystallization and sublimation.

Naphthalene crystallizes in large, thin, rhombic plates, which are unctuous to the touch, and have a pearly lustre. Exposed to light under a glass covering, it gradually sublimes at an ordinary temperature in splendid crystals. It has a somewhat tar-like odor, and a pungent and somewhat aromatic taste. It fuses at 176° F. (80° C.), and boils at 424.4° F. (218° C.). Its specific gravity, in the solid state, is 1.15, and as a vapor, 4.528. It is not very inflammable, and when ignited, burns with a white smoky flame. It is insoluble in water, but dissolves readily in alcohol, ether, and the fixed and essential oils.

By acting on naphthalene with an excess of sulphuric acid, we obtain *naphthalene-sulpho acid*, $C_{10}H_7 \cdot SO_3H + H_2O$, from which, by substitution processes, a large number of compounds are produced. With nitric acid, naphthalene yields nitro-naphthalene $[C_{10}H_7NO_2]$, dinitro-naphthalene $[C_{10}H_6(NO_2)_2]$, and trinitro-naphthalene $[C_{10}H_5(NO_2)_3]$, the group (NO_2), or its multiples, being substituted for one, two, and three equivalents of the hydrogen of the naphthalene. The final product of the prolonged action of boiling nitric acid on naphthalene is a mixture of oxalic and *naphthalic* or *phthalic acid;* the reaction being shown by the equation:

Naphthalene. Oxygen. Oxalic Acid. Phthalic Acid.

$$\overbrace{C_{10}H_8} + \overbrace{O_8} = \overbrace{H_2C_2O_4} + \overbrace{C_6H_4(COOH)_2}$$

This acid is also obtained by the continued action of nitric acid upon alizarin, which is an important fact, since it indicates a connection between naphthalene and the coloring matter of madder.

Laurent has discovered a very numerous series of substitution compounds formed upon the type of naphthalene, into the composition of which chlorine enters. They are of little practical importance although their investigation has exerted a remarkable influence upon the progress of organic chemistry.

NAPIER, Sir CHARLES, K. C. B., English admiral, was cousin to the hero of Scinde and the historian of the peninsula war. His father was the Hon. Capt. Charles Napier, R. N., second son of Francis, fifth lord Napier. He was born March 6, 1786, at the family seat, Merchiston hall, in the co. of Stirling, Scotland. At 13, he went to sea as a naval volunteer. In 1808, he received the command of the *Recruit*, 18 guns, and had his thigh broken by a bullet. He kept up a running fight, in his 18-gun brig, with the rearmost of three French line-of-battle ships, the *D'Hautpoult*, which escaped from Guadeloupe, and was thus instrumental in her capture. This obtained him a post-captaincy; but being thrown out of active service, he served ashore as a volunteer in the peninsular army, and was wounded at Busaco. Commanding the *Thames* in 1811, he inflicted an incredible amount of damage upon the enemy in the Mediterranean, and also conducted several desperate land operations with marked success. In 1814, he was ordered to America, and led the way in the hazardous ascent and descent of the Potomac. He afterwards took an active part in the operations against Baltimore. In 1829, he received the command of the *Galatea*, a 42-gun frigate, and was employed "on particular service" on the coast of Portugal. Becoming acquainted with the leaders of the constitutional party, he accepted the command of the fleet of the young queen; and by defeating the Miguelite fleet, he concluded the war, and placed Donna Maria on the throne. He was made admiral-in-chief of the Portugese navy, and attempted to remodel it; but official and corrupt influence was too strong for him, and he returned to England. In the war between the Porte and Mehemet Ali, he organized a land force, with which he stormed Sidon, and defeated Ibrahim Pasha among the heights of Mount Lebanon. He took part in the naval attack on Acre, and did not hesitate to disregard the orders of his chief, Admiral Stopford, when he saw the way to bring the battle to a speedy termination. He next blockaded Alexandria, and concluded a convention with Mehemet Ali. In 1847, he received the command of the channel fleet. When the Russian war broke out, he was sent out to command the Baltic fleet; but the capture of Bomarsund failed to realize the high expectations formed of Napier's exploits. He twice sat in parliament, and, until his death, Nov. 6, 1860, he labored with success to reform the British naval administration. He was at the time of his death a vice-admiral and a knight of several foreign orders.

NAPIER, Sir CHARLES JAMES, G.C.B., English general, one of several brothers distinguished for their bravery, three of whom—Charles, William, and George—were known in the peninsular war as "Wellington's colonels." They were sons, by a second marriage, of Hon. Col. George Napier, grandson of Francis, fifth lord Napier, who was fifth in descent, but through two females in succession, from the inventor of Logarithms. Charles, the eldest, was born at Whitehall, Westminster, Aug. 10, 1782. Before he had finished his twelfth year, young Napier received a commission in the 22d Foot. His first service was in Ireland, where he assisted in putting down the rebellion He commanded the 50th Foot during the retreat on Corunna; and at the fatal battle in which sir J. Moore fell, he was wounded in five places and made prisoner. Marshal Ney dismissed him, with permission to go to England on parole. On his return, he engaged in literary works, and even wrote an historical romance. In 1811, he returned to the peninsula. At Coa, where he fought as a volunteer, he had two horses shot under him. At Busaco, he was shot in the face, having his jaw broken and his eye injured. He recovered in time to be present at the battle of Fuentes d'Onoro and the second seige of Badajoz. After distinguishing himself in innumerable skirmishes, the daring soldier returned to England. He next took part in a fighting cruise off the Chesapeake, capturing American vessels, and making frequent descents upon the coasts. He did not return to Europe soon enough for Waterloo, but was engaged in the storming of Cambray, and accompanied the army to Paris. After the peace he was, in 1818, made governor of the island of Cephalonia, the affairs of which he administered with great energy and intelligence. Being, however, of an excessively combative disposition, he became embroiled with the authorities at home. In 1841 he was ordered to India to assume the command of the army at Bombay. This was the most splendid period of his career, resulting in the conquest of Scinde against terrible odds. His destruction of a fortification called Emaun Ghur in 1843, was described by the duke of Wellington as one of the most remarkable military feats he had ever heard of. The fearful battle of Meane followed, where Napier, with 1600 English and sepoys, defeated near 30,000 Beloochees, strongly posted, with the loss of 6,000 men. The Ameers surrendered, except Shere Mahomed, who brought 25,000 men into line of battle at Hydrabad. Napier had only 5,000 men, but in three hours his little army gained a decisive victory. A few days afterwards, Napier was in the palace of the Ameers, and master of Scinde. He was fortunate in possessing the entire confidence of lord Ellenborough, who made him governor of Scinde. His

civil administration was scarcely less remarkable or less successful than his military operations. He gained the respect and reverence of the inhabitants, but soon became engaged in an acrimonious war of dispatches with the directors. In 1847, he returned to England. After attending a series of festivals in his honor, he lived in retirement until the disasters of the last Sikh war caused the eyes of his countrymen to be turned to the hero of Scinde as the deliverer of our Indian empire. He went to India, but found on his arrival that the Sikhs had been routed. He now turned his attention, as commander-in-chief of the army in India, to the subject of military reform. He bade a final adieu to the east in 1851, and returned to his native country, where he resided until his death, which took place at his seat, at Oaklands, near Portsmouth, Aug. 29, 1853. He had then attained the rank of lieutenant-general, was G.C.B., and colonel of the 22d Foot. It must be remembered to his honor that he was the first English general who ever recorded in his dispatches the names of private soldiers who had distinguished themselves, side by side with those of officers. Brave to rashness, ready alike with tongue, pen, and sword, quarrelsome with his superiors, but beloved by his soldiers, and, to crown all, of a strangely wild, yet noble and striking appearance, Napier was one of the most remarkable men of his time, and in losing him the country lost one of its brightest military ornaments. His statue was, after his death, erected in Trafalgar square. The story of his *Conquest of Scinde* has been written by his brother, Lieut.Gen. Sir William Francis Patrick Napier, K.C.B., born Dec. 17, 1785, who served in the peninsular campaign, and was engaged from 1824 to 1840 in preparing his *History of the Peninsular War*, the greatest military history in the English language. He died Feb. 12, 1860, at Scinde house, Clapham, and was followed in a few weeks to the tomb by his wife, lady Napier, niece of the great C. J. Fox. Her extraordinary skill in translating French documents written in cypher, and her indefatigable labors as her husband's amanuensis, are touchingly commemorated in the preface to the edition of the *History of the Peninsular War*, published in 1851.

NAPIER, John, Laird of Merchiston, was b. at Merchiston Castle, near Edinburgh, in 1550, and d. there on April 4, 1617. After attending the regular course in arts at the university of St. Andrews, he traveled for some time on the continent, and returned to his native country highly informed and cultivated for the age. Declining all civil employments, for which his many accomplishments eminently fitted him, he preferred the seclusion of a life devoted to literary and scientific study. From this time his history is a blank till 1593, when he published his *Plaine Discouery* (or "interpretation") *of the whole Reuelation of Saint John* (Edin. 5th ed. 4to, 1645), a work displaying great acuteness and ingenuity, but, it is scarcely necessary to add, not in any sense a "plaine discouery" of the apocalypse. In the dedication to king James VI. he gave his majesty some very plain advice regarding the propriety of reforming his "house, family, and court;" and on republishing the work he added a supplement, resolving "certaine doubts mooved by some well-affected brethren." About this time he seems to have devoted much of his time to the invention of warlike machines, but these inventions were never perfected, probably from motives of humanity. Like other eminent men of the time, Napier, though a strict Presbyterian, seems to have been a believer in astrology and divination, but there is no satisfactory proof that he ever practiced these arts. In 1596 he proposed the use of salt as a fertilizer of land, an idea which, though scouted at the time, is now generally received. Another large blank in his history here occurs, and terminates in 1614, at which date he first gave to the world his famous invention of logarithms (q.v.), in a treatise entitled *Mirifici Logarithmorum Canonis Descriptio* (4to, Edin.). This was followed by another work, *Rabdologiæ, seu numerationis per Virgulas libri duo* (Edin. 1617), detailing an invention for simplifying and shortening the processes of multiplication and division. See Napier's Bones. He also prepared a second work on logarithms, showing their mode of construction and application, with an appendix containing several propositions of spherical trigonometry, and those formulæ which are now known by his name. This work was published after his death by his son Robert, under the title of *Mirifici Logarithmorum Canonis Constructio, etc., quibus accessere Propositiones ad Triangula sphærica faciliore calculo resolvenda, etc.* (Edin. 1619), and occurs along with the *Canonis Descriptio*. The latter work is included in baron Masere's extensive collection, the *Scriptores Logarithmici* (Lond. 1808). Napier's eldest son, Archibald, was raised to the peerage as the first lord Napier by Charles I. in 1627, and his descendants still bear the title. Two lives of Napier have been published, the one by the earl of Buchan (1787), and the other by Mr. Mark Napier (1834).

NAPIER, Macvey, 1776-1847; b. Scotland; educated at the universities of Glasgow and Edinburgh. He was intended for the law, and served an apprenticeship with a member of the society of writers of the signet, of which he afterwards became librarian. He was soon chosen by the society to fill a lectureship on conveyancing, newly established by the society, and soon after transferred into a professorship at the university of Edinburgh. From 1815 to 1824 he spent most of his time editing a supplement to an encyclopædia. In 1825 he was made professor of conveyancing in the university of Edinburgh. In 1830, on the accession of the whigs, he was appointed principal clerk of session, and resigned his office of librarian. He had long been an occasional contributor to the *Edinburgh Review*, to the editorship of which he succeeded upon the appointment of Jeffrey as dean of the faculty of advocates. Thereafter he wrote little

himself, but he was a successful editor, and enjoyed the confidence of the many distinguished contributors to the *Review*.

NA'PIER, Robert, 1791--1876; b. Scotland; son of a blacksmith, who sent him to a grammar school, where he learned, besides the ordinary English rudiments, French, Latin, and landscape drawing. After serving an apprenticeship with his father he went to Edinburgh, and afterwards to Glasgow, where, in 1815, he began the blacksmith's business, with two apprentices. In 1823 he built his first marine engine, which was the beginning of a prosperity which gradually extended his works till they employed a force of 3,000 men. In 1830 he furnished the steamships for the Dundee and London shipping company; in 1839 he built the *Fire-King*, the fastest steamer then constructed, and in 1840 he supplied the Cunard company with their first four steamers. He received the great gold medal at the Paris exposition in 1855.

NAPIER, The Right Hon. Sir Robert Cornelius, Baron Napier of Magdala, was b. in Ceylon, Dec. 6, 1810, and was educated at the military college at Addiscombe. He entered the Bengal engineers in 1826, served in the Sutlej campaign, was wounded while acting as chief engineer at the siege of Moultan, and had a prominent share in the battle of Gujerat. As chief engineer of the Punjab, with the rank of col., he greatly developed the resources of the country. During the Indian mutiny he was chief engineer in sir Colin Campbell's army, and especially distinguished himself at the siege of Lucknow. For his services in the Chinese war of 1858 he was made maj.gen. and K.C.B. As commander of the expedition in Abyssinia in 1868 he achieved a brilliant success, both by his whole management of the short campaign and in the storming of Magdala, which ended it. On his return he received the thanks of parliament, an annuity of £2,000, and a peerage. In 1870 he was appointed commander-in-chief of the forces in India, and nominated a member of the Indian council. In 1877 he was made governor of Gibraltar. He died in January, 1890.

NAPIER'S BONES, an invention of the celebrated Napier (q.v.) of Merchiston for the purpose of performing mechanically the operations of multiplication and division. The "bones" were narrow slips of bone, wood, ivory, or metal, about 3 in. long by $\frac{8}{10}$ths of an inch in breadth, and divided by transverse lines into nine compartments; each of these compartments being divided into two portions by a diagonal line running from the upper right hand to the lower left hand corner. The "bones" were divided into sets, all those of one set having the same digit occupying the top compartment, and the several multiples of that digit occupying in order the eight lower compartments; when the multiple consisted of two figures, these were placed one on each side of the diagonal line. There was necessarily a set of bones for each digit. There was also another rod similarly divided into compartments, in which were placed the nine digits; this was called the *index-rod*. Multiplication was performed as follows; e.g., if 6795 is to be multiplied by 97834, four rods whose top digits were 6, 7, 9, 5 are selected and arranged in the order of the figures in the multiplicand, and the index-rod placed alongside them; the several figures of the multiplier are then sought for on the index-rod, the two lines of figures opposite each figure on the index are then added together diagonally, and the five sums thus obtained are arranged as follows:

9	61155
7	47565
8	54360
3	20385
4	27180

664782030 = the product required.

Division is performed in an analogous manner. The contemporaneous invention of logarithms for the same purpose of converting multiplication and division into addition and subtraction caused Napier's bones to be overlooked, and they are now scarcely ever used.

NA'PIERVILLE, a co. in s.w. Quebec, Canada, on the Grand Trunk railroad; 153 sq.m.; pop. '91, 10,101. Co. seat, Napierville.

NAPLES. The Italian provinces (formerly kingdom) of Naples and Sicily, or the Two Sicilies, occupy the south end of the Italian peninsula, and consist of the continental territory of Naples and the insula dependency of Sicily. The distinctive physical features of Naples and Sicily are noted under the names of the different provinces of Italy and in the article Sicily. They are favored by nature with a salubrious and almost tropical climate, unbounded fertility, and teeming population; and they present natural features of rare attractiveness. The rural population are an acute, frugal, and laborious race, and form a strong contrast to their idle, and debased brethren of the towns. For statistics of products, exports, and population, see Italy and Sicily. Naples, in ancient times, was divided into numerous petty states independent of each other, and its inhabitants were of various races. Many of these states arose from Greek colonies, which had been founded in the country previous to the 7th c. B.C. The ancient historical importance of Naples is attested by the splendor of its cities, and the warlike renown of its population. On its conquest by the Romans, the great Neapolitan cities severally adopted the munici-

pal, federative, or colonist form of government, and gradually assimilated their laws and customs to those of their conquerors. After the downfall of the Western empire, Naples was seized by Odoacer, but soon afterward (490 A.D.) it was subjected by the Goths, and in the following century by the Lombards, who established in it various independent duchies, as Benevento, Spoleto, Salerno, Capua, etc. Most of these were overthrown by invading bands of Arabs, Saracens, and Byzantines, who were in turn expelled, and the whole country subdued by the Normans in the 11th century. The Normans subsequently erected Naples and Sicily into a kingdom, and established a new political, ecclesiastical, and military system. To the Norman dynasty succeeded that of the Hohenstaufen, whose rule was marked by an immense intellectual and social advancement of the people; but the vindictive enmity with which the papal see regarded this dynasty, led to the invasion of Naples by Charles of Anjou, who, notwithstanding the heroic resistance of king Manfred (q.v.), by the battle of Benevento (1266) annihilated the power of the Hohenstaufen. The ascendency of Charles of Anjou was further effectually secured by the treacherous defeat and decapitation (1268) of Konradin (q.v.), the last male-heir to the throne. By the *Sicilian Vespers* (q.v.) the island of Sicily was, however, wrested in 1282 from his grasp, and became an appanage of the Spanish crown. The predominance of the Neapolitan Guelph or papal party during the glorious reign of Robert I., who was the patron of Dante and Boccaccio, the depraved libertinism of his heiress and granddaughter Joanna, the fearful ravages committed by predatory bands of German mercenaries and by the plague, the futile attempts of the Anjou sovereigns to recover Sicily, and the envenomed feuds of rival claimants to the throne, are the leading features of the history of Naples during the rule of this dynasty, which expired with the profligate Joanna II. in 1435; and was followed by that of Aragon, which had ruled Sicily from the time of the Sicilian Vespers. During the tenure of the Aragon race, various unsuccessful attempts were made by the house of Anjou to recover their lost sovereignty; and the country, especially near the coast, was repeatedly ravaged by the Turks (1480). In fact, after the death of Alfonso, the first ruler of the Aragon dynasty, the country groaned under a load of misery. Wars, defensive and offensive, were incessant, the country was inpoverished, and a conspiracy of the nobles to remedy the condition of affairs was productive of the most lamentable results, both to the conspirators themselves, and to the other influential Neapolitan families. In 1495, Charles VIII. invaded Naples, and though he was compelled to withdraw in the same year, his successor, Louis XII., with the treacherous assistance of Ferdinand (the Catholic) of Spain, succeeded in conquering the country in 1501. Two years afterward, the Spaniards under Gonzalvo di Cordova (q.v.) drove out the French, and the country from this time became a province of Spain. Sicily had previously (1479) been annexed to the same kingdom. During the two centuries of Spanish rule in Naples, the parliaments which had existed from the time of the Normans fell into desuetude, the exercise of supreme authority devolved on viceroys, and to their ignorance, rapacity, and oppressive administration may be solely ascribed the unexampled misery and abasement of this period. In the words of Sismondi, "no tax was imposed save with the apparent object of crushing commerce or destroying agriculture, and the viceregal palace and the tribunals of justice became public offices in which the highest dignities and most sacred interests of the state were openly bartered to the wealthiest bidder." During the Spanish rule, a formidable rebellion took place in 1647, headed first by Masaniello (q.v.), and afterward by Henry V., duke of Guise; the whole population of the province renounced their allegiance to their Spanish sovereigns, but the arrival of a new viceroy, who was equal to the occasion, resulted in the capture of the duke of Guise and the re-subjugation of the country. At length, during the war of the Spanish Succession (see SUCCESSION WARS), Naples was wrested from Spain by Austria in 1707, and Sicily in 1708; but while Austria secured Naples by the treaties of Utrecht (1713) and Rastadt (1714) Sicily was given to Savoy by the former treaty. In 1720, however, both Sicilies were reunited under the Austrian rule, and in 1735 were given to Don Carlos, third son of Philip V. of Spain, who ascended the throne as Charles I., and founded the Bourbon dynasty. His reign was marked by equity and moderation; great reforms were effected in the administration of public affairs, science and literature were encouraged, and splendid works of public utility were erected throughout the kingdom. It was during his reign that Pompeii and Herculaneum were discovered. His successor, Ferdinand IV., followed in the course of legislative reform; but on the proclamation of the French republic (1789), his states were invaded by a French army, and the kingdom of Naples was erected into the Parthenopean republic (1799). Ferdinand retired with his court to Sicily, and for a brief period enjoyed the restoration of his sovereign rights in Naples; but a second invasion by Napoleon (1806) ended in the proclamation of his brother, Joseph Bonaparte, as king of Naples; and on this latter assuming the Spanish crown in 1808, that of Naples was awarded to Joachim Murat, brother-in-law of Napoleon. On the defeat and execution of Murat in 1815, the Bourbon monarch, Ferdinand IV., was restored. The liberal insurrectionary movements in Naples in 1821 and 1830 were the forerunners of the revolution of 1848; and in each case the party of progress was combated by the respective kings with ruthless severity, and perfidious concessions, to be canceled and avenged with sanguinary fury when the disarmed and credulous patriots were at the mercy of the sovereigns. See article GARIBALDI for the ultimate overthrow of the Bourbon dynasty in the kingdom of Naples,

and its subsequent annexation to the kingdom of Italy under king Victor Emmanuel; also articles FERDINAND II. and ITALY. For the history of Sicily previous to its annexation to and during its various separations from Naples, see SICILY.

NA'PLES (Ital. *Napoli*, anc. *Neapolis*), a city of southern Italy, capital of the province of Naples; is built partly at the base, partly on the slopes of two crescent-shaped acclivities on the famous bay of the same name. Pop. at the end of 1894, 526,800. Lat. 40° 52′ n.; long. 14° 15′ e. The wonderful beauty of the site and of the surrounding prospect, the delicious softness of the climate and the clear atmosphere, make Naples famed among the cities of the world. It is one of the chief centers of commerce and industry of Italy, possesses a very extensive mercantile shipping, and is one of the principal stations of Mediterranean steam navigation.

The public buildings of Naples are numerous and grand, but are devoid of architectural symmetry in consequence of the antiquity of their origin, and the irregularity of their site. Many of the old streets are paved with lava, and inconveniently narrow, with houses of great height. The modern streets, however, are spacious and splendid. The city is divided into the old and the new town, or the east and west crescents, by a lesser range of heights—viz., the Capodimonte, the St. Elmo, and the Pizzofalcone, terminating in the rocky promontory called the Castel dell' Ovo. In 1868 a landslip destroyed a number of houses at the foot of Pizzofalcone. The eastern division of Naples is the most ancient and the most densely peopled; it contains the principal public structures, and is intersected by the splendid Via Roma, the old Via di Toledo. The western, or modern section, contains the famous Riviera di Chiaja, or the quay, a fine road running along the bay in a curved course of three miles, flanked on the right by a row of palaces, and bordered on the left by the beautiful pleasure grounds of the Villa Reale, which lie between it and the sea, and of which the natural beauty is heightened by the interspersion of temples, fountains, and statuary groups amidst the acacia, myrtle, and orange groves. The public squares, or *larghi*, of Naples are adorned with fountains and obelisks; and within the precincts of the city there are several highly-prized springs, both of fresh and mineral waters. The fortified castles are numerous. Amongst the principal are the Castel Nuovo, called the Bastille of Naples, somewhat similar to the Tower of London, and adorned with a fine triumphal arch, erected in honor of Alfonso of Aragon; the Castel dell' Ovo, so called from its oval or egg shape, standing on a promontory, and connected by a bridge with the mainland; the Castel Sant' Elmo, commanding a magnificent view from its ramparts, and formerly of immense strength; and the dismantled Castel del Carmine. The churches are upwards of 350, and many are rich in architectural and archæological interest. The cathedral dedicated to St. Gennaro (St. Januarius, q.v.) contains the celebrated phials in which the liquefaction of St. Gennaro's blood is alleged to take place on two annual festivals; it also contains the tombs of Charles of Anjou and of Pope Innocent IV., besides numerous fine paintings and statues. Among the educational institutions of Naples is the famous university, founded in the 13th century, and now the largest in point of attendance in Italy. It has four faculties, a valuable mineralogical and zoological museum, an observatory on Capodimonte, and a fine library. Besides the university library, there are the large national library and the Brancacciana library. A magnificent aquarium has been opened since 1871, with a zoological laboratory, in which many distinguished foreign naturalists are at work. The philanthropical establishments are on an immense scale, and are richly endowed. There are also several theaters in the city, of which that of *San Carlo* (devoted to the opera) is one of the largest and most celebrated in Italy. In the Museo Nazionale, Naples contains an unrivaled collection of art, comprising frescoes, paintings, mosaics, sculptures, bronzes, antiquities, coins, medals, inscriptions, and the renowned collection of precious objects excavated from Herculaneum and Pompeii. Water was introduced in 1884.

The environs of Naples, apart from their extreme beauty of scenery, are highly interesting. The locality which contains the tomb of Virgil, the disinterred towns of Herculaneum and Pompeii, Vesuvius (from an eruption of which Naples suffered in 1872), and the Roman remains, must possess an inexhaustible source of interest for scientific, antiquarian, and classical investigators. The modern villas of Naples are splendid and luxurious. One of the most striking features of Naples is its unique population and the universal publicity in which life is passed. The inhabitants forever swarm in the thoroughfares, where an incessant throng of venders, purchasers, and idlers intermingle with asses, mules, hand-carts, and conveyances, dazzling the eye with their brilliant variety of costume, and the pantomimic expressiveness of their frantic gestures and attitudes; while the ear is stunned by the shrill conflicting cries of the ambulatory venders of every conceivable commodity, by the piercing notes of the improvisatore's song, and the uproarious hilarity and high-pitched patois of the countless masses, whose sole abode appears to strangers to be the thronged public squares and streets. The popular language of Naples, which is a corrupt dialect of Italian and Spanish, is in prevalent use among all classes of society; it lends itself especially to the satirical and facetious squibs and compositions in which the Neapolitans excel. The popular Neapolitan songs in the native patois are exquisitely naïve and expressive in sentiment, and are set to popular melodies which exert a maddening charm over this southern populace. The physical condition of the lower classes of Naples, and especially of the lazzaroni (q.v.), has, since the unification of Italy, sensibly improved, both as regards raiment and lodging.

The name Naples (Gr. *Neapolis*, new city) had reference to an older town in the neighborhood, called originally Parthenope, and, after the foundation of the new town, Palæpolis (old town), which was situated most probably on the ridge called Posilipo, that separates the bay of Pozzuoli or Baiæ from that of Naples. Both towns were Greek settlements, apparently colonies from the neighboring Cumæ, joined by immigrants direct from Greece. In 327 B.C. Palæpolis was besieged and taken by the Romans, and thenceforth disappears from history; Neapolis submitted without resistance, and became a favored and faithful ally, or rather provincial city of Rome. It long, however, retained its purely Greek character and institutions; and there is evidence that the Greek language continued to be used, even in public documents, as late as the 2d c. of the Christian era. Naples was a flourishing and populous city during the Roman empire; and, notwithstanding the vicissitudes of the Gothic conquest of Italy, and the reconquests by the Byzantine emperors, it continued to be one of the most important and opulent places in Italy. About the 8th c. it threw off allegiance to the Byzantine emperors, remained independent till it fell into the hands of the Normans in 1140 A.D., and became the capital of the kingdom of Naples.

NAPLES, BAY OF, an indentation of the Mediterranean Sea on the s.w. coast of Italy, opposite the city of Naples, is 20 m. wide from Cape Miseno on the n.w. to Cape Campanella on the s.e., and from this line extends inward for about ten miles. The scenery is very beautiful. On the shores are many towns and villages; the prospect is bounded on the east by mount Vesuvius, and on the outskirts of the bay are the islands of Ischia and Capri.

NAPLES-YELLOW is a pigment used by artists. It consists of antimoniate of lead, and is obtained by the direct combination of antimonic acid and oxide of lead under the influence of heat.

NAPOLÉON BONAPARTE, Emperor of the French, was b. at Ajaccio, in the island of Corsica, Aug. 15, 1769. (For an account of the family to which he belonged, see BONAPARTE, FAMILY OF.) At the age of ten he entered the military school at Brienne, as a king's pensioner. Here he remained five years and a half. During that period he displayed a great aptitude and predilection for mathematics, history, and geography, and an indifference to merely verbal and literary studies. His manner was somber and taciturn, but as Bourrienne (who was his schoolfellow) says, this arose chiefly from the circumstance that he was a foreigner, poor, and unaccustomed to the use of French, which he first learned at Brienne. In Oct., 1784, he proceeded to the military school to complete his studies for the army, and in rather less than a year obtained his commission as sub-lieutenant in the artillery regiment *de la Fère*. When the revolution broke out, Napoléon was in garrison at Valence. He took the popular side, but in a quiet and undemonstrative way, for he did not love the boisterous enthusiasm of unmanageable mobs. When the armed rabble of Paris poured out to the Tuileries on the famous 20th of June, 1792, Napoléon, who was then in the city, followed the "despicable wretches" (as he called them), along with his friend Bourrienne; he saw them force the poor king to stick the red cap on his head, and smile fatuously from the windows of his palace. "It is all over henceforth with that man," said the young officer, and returned to Paris graver and more thoughtful than Bourrienne had ever seen him. After the scenes of Aug. 10 he left for Corsica, where Gen. Paoli held the chief command. The excesses of the Septembrists and terrorists, however, induced Paoli to throw off his allegiance to the convention, and to seek the assistance of England. Napoléon was active but unsuccessful in his opposition to the designs of the general, and was obliged, along with his relatives, to flee from the island.

He now petitioned the convention for employment, and was sent to assist in the reduction of Toulon, with the rank of lieutenant-colonel of artillery. The city was captured (Dec. 19, 1793) entirely through the strategic genius of Napoléon, and in the following February he was raised to the rank of brigadier-general, and placed at the head of the artillery in the army of the south. Later in the year he was sent to Genoa, to examine the state of the fortifications of the city, and to discover the political disposition of the inhabitants. In the beginning of 1795 he was again in Paris seeking active employment, and thinking, from sheer ennui, of transferring his services to the sultan of Turkey. The convention was now in great peril, on account of the mutinous spirit of the arrondissements of the capital, and, on the suggestion of Barras, Carnot, Tallien, and others, Napoléon was made commander of the troops provided for its defense. On the 13th Vendémiaire (Oct. 4, 1795) the national guard, 30,000 strong, attempted to force its way into the Tuileries, where the convention was sitting, but was routed and dispersed by a terrible cannonade directed by the young artillery officer. Napoléon was immediately appointed to the command of the army of the interior. About this time he made the acquaintance of Joséphine Beauharnais, whom he frequently met at the house of Mme. Tallien. Captivated by her elegant manners and amiable disposition, he proposed marriage to the graceful widow and was accepted. The ceremony took place Mar. 9, 1796. A few days before he had been appointed to the supreme command of the army of Italy, and he was obliged to leave his bride almost at the altar. On his arrival he found the troops in a wretched condition. He had only 36,000 available men, and even these were half-starved and only half-clothed, to oppose to an Austrian and Piedmontese force of 75,000. Yet he

was not afraid to undertake the conquest of upper Italy. Leaving Nice at the close of March, he won his first victory over the Austrians at Montenotte (April 11), which opened the Apennines for him; three days later a second success at Millesimo separated the allied armies; and, finally, his victory at Mondovi (on the 22d) compelled Sardinia to implore peace. He now hoped to utterly crush the Austrian army under Beaulieu, and at the battle of Lodi (on May 10) nearly accomplished it. His opponent did not venture to defend the line of the Mincio, but hastily throwing a garrison into the city of Mantua, retreated into the Tyrol. Napoléon immediately entered Milan, and took possession besides of all the principal cities of Lombardy. Now began that system of enormous and unscrupulous plunder in northern and central Italy which gives something of a barbaric character to the conquests of the French. The Directory gave orders that Napoléon should levy contributions from all the states which he had gratuitously freed, and according to his own account he sent to France not less than 50,000,000 francs. His officers and commissaries actually seized whatever they wished, provisions, horses, and all manner of stores; and because Pavia ventured to make some slight resistance to the shameful extortions of the republicans, Napoléon gave it up to havoc for 24 hours. A body of savants(including Monge, Berthollet, and others) were dispatched to Italy to superintend the spoliation of its artistic treasures; and both now and in the subsequent Italian campaigns pictures, statues, vases, and mss. were carried off in great numbers, to gratify the vanity of the Parisian sight-seers. In this way Lombardy, Parma, Modena, Bologna, and the states of the church were savagely harried before the end of June—Pope Pius VI., in particular, being forced to submit to conditions of extreme rigor.

Meanwhile Austria had resolved to make another effort for the recovery of Lombardy. About the close of July Marshal Wurmser advanced from Trent at the head of 60,000 men, forced Napoléon to raise the siege of Mantua, but was himself defeated, with the loss of all his cannon, near Castiglione (Aug. 5), and again at Bassano (Sept. 8), in consequence of which he was driven to take refuge within the fortress of Mantua with some 16,000 troops—the shattered remains of his 60,000. Austria, however, was not disheartened. A *third* army was dispatched in two divisions: 30,000 from Carinthia, under Marshal Alvinzi; and 20,000 from the Tyrol, under Gen. Davidowich. This was a terrible campaign for Napoléon; his veterans were exhausted, his new supports had not arrived; he himself was despondent, while the Austrians were fresh and hopeful. At first the latter were completely successful; but the great victory of Arcola, won by Napoléon (Nov. 17) after three days' fierce fighting, in which he lost nearly all his general officers, decided the fate of the campaign. His dispatches to the directory, penned about this period, show how thoroughly he apprehended the state of parties in Italy, and also how utterly indifferent he was to any considerations beyond those that advanced the interests of France. In Jan., 1797, a fourth campaign was commenced by Austria. At the head of 50,000 fresh troops, Alvinzi descended from the Tyrol, but was completely routed by Napoléon at Rivoli, on the 14th of the month; while, not long after, Wurmser was starved into surrender at Mantua. A *fifth* army was assembled on the Tagliamento, under the command of the archduke Charles; but his troops were mainly raw recruits, while those of Napoléon were inured to war and flushed with innumerable triumphs. In consequence he was forced to retreat, which, however, he did slowly and in good order, hoping to surround his opponent in the interior of the country. Napoléon's design was to march on Vienna, and he actually penetrated as far as Judenburg, in upper Styria, only eight days' march from the capital. The Austrian government at length was seized with alarm, made overtures of peace, and finally on Oct. 17, 1797, the famous treaty of Campo Formio was signed, by which Austria ceded the Netherlands, Lombardy, and some other smaller territories to France; while she herself obtained in return, through disgraceful treachery on the part of the victor, possession of the province of Venice. It is generally said that Napoléon's military genius was never more brilliantly displayed than in these early Italian campaigns. In ingenuity of plan, celerity of movement, audacity of assault, he far outshines all his adversaries; it is, moreover, but just to him to state, further, that he made desperate efforts to stop the excesses of the most scoundrelly commissariat in Europe; and that while in the main he showed no hesitation in carrying out the brigand-like orders of the Directory, he does not appear to have appropriated a single penny to himself. It was power, not gold, that he cared for.

In Dec., 1797, Napoléon returned to Paris, where he was received with the utmost enthusiasm. At this time there was much talk, and probably some vague design, on the part of the directory, of invading England, and Napoléon was appointed commander-in-chief of the invading army. It has been thought, however, that this was merely a feint to mask the real design of the Directory; viz., the invasion of Egypt, as perhaps a preliminary step to the conquest of British India. Be that as it may, an expedition against Egypt was resolved on by the directory; and on May 19, 1798, Napoléon sailed from Toulon, with a fleet containing 30,000 soldiers and a body of savans to investigate the antiquities of the country. He reached Alexandria on June 29. At this moment France was at peace with Turkey; the invasion of Egypt, a Turkish dependency, was therefore an act utterly unjustifiable, and reminds us not of European warfare, but rather of the irruption of a horde of barbaric Tartars. Napoléon, having landed his troops, captured Alexandria and marched on Cairo. The Mamelukes prepared resistance; but on July 21, at the battle of the pyramids, they were completely defeated, and the French became

in a surface-way, masters of Egypt. Napoléon now entered the capital, and immediately commenced to reorganize the civil and military administration of the country; for he took a great, but also an ostentatious, pleasure in this sort of work. Meanwhile, on Aug. 2, Nelson had utterly destroyed the French fleet in Aboukir Bay, and so cut off Napoléon from communication with Europe. A month later the sultan declared war against him. This was followed by disturbances in Cairo, which were only suppressed by horrible massacres. It was obviously necessary that Napoléon should go somewhere else. He resolved to meet the Turkish forces assembling in Syria; and in Feb., 1799, crossed the desert at the head of 10,000 men, stormed Jaffa on Mar. 7 after a heroic resistance on the part of the Turks, marched northwards by the coast, and reached Acre on the 17th. Here his career of victory was stopped. All his efforts to capture Acre were foiled through the desperate and obstinate valor of old Djezzar (q.v.) Pasha, assisted by sir Sydney Smith with a small body of English sailors and marines. On May 21 he commenced his retreat to Egypt, leaving the whole country on fire behind him, and re-entered Cairo on June 14. It was during his absence that the savans made their valuable researches among the monuments of upper Egypt. About the middle of July the sultan landed a force of 18,000 men at Aboukir, who were attacked by Napoléon on the 25th, and routed with immense slaughter. But the position of the victor was far from comfortable, and he therefore resolved to return to France—especially as news had come to him of disasters in Italy and confusions in Paris. On Aug. 23 he sailed from Alexandria, leaving his army behind him under the command of Kleber; and after narrowly escaping capture by the English fleet, landed near Frejus on Oct. 9. He hastened to Paris, soon mastered the state of affairs, threw himself into the party of Sieyès, and overthrew the Directory (q.v.) on the famous 18th Brumaire. A new constitution was drawn up, chiefly by Sieyès, under which Napoléon became first consul, with the power of appointing to all public offices, of proposing all public measures in peace or war, and the entire command of all administrative affairs civil and military. In a word, he was ruler of France; and though far from satisfied with the clumsy machinery of Sieyès's plan, he could afford to wait the future. About the end of Jan., 1800, he took up his residence in the Tuileries. The country was tired of revolutions, discords, and confusions; it was proud of its young leader, who seemed inspired but not enslaved by the ideas of his age, and who knew how to enforce obedience as well as to panegyrize principles. It therefore regarded his assumption of sovereign power with positive satisfaction. Napoléon displayed extraordinary vigor as an administrator, recruited the national treasury by various sagacious expedients, repealed the more violent laws passed during the revolution, such as punishment for matters of opinion, reopened the churches, and terminated by policy the Vendean struggle. But he knew well that his genius was essentially military, and that his most dazzling and influential triumphs were those won on the battle-field. France was still at war with Austria, and he resolved to renew the glories of his first Italian campaigns. Leaving Moreau in command of the army of the Rhine, he assembled, with wonderful rapidity and secrecy, an army of 36,000 men on the shores of the lake of Geneva, and on May 13 (1800) began his magnificent and daring march across the Alps. Almost before the Austrian general, Melas, was aware Napoléon had entered Milan (June 2). Twelve days afterwards was fought the fiercely contested yet decisive battle of Marengo, which compelled the Austrians to resign Piedmont, with all its fortresses, and (for the second time) Lombardy to the French. Later in the year hostilities were recommenced; but the Austrians, beaten by Moreau in Germany (at Hohenlinden, etc.) and by Napoléon in Italy, were at last forced to make peace; and on Feb. 9, 1801, signed the treaty of Lunéville, which was mainly based on that of Campo Formio. In the course of the same year France and England also made peace; but the treaty (known as that of Amiens) was not definitively signed till Mar. 27, 1802. Not less important for the consolidation of affairs in France was the famous *concordat* (q.v.) between Napoleon and Pope Pius VII., also concluded in 1801. In Jan., 1802, Napoléon became president of the Cisalpine republic; and on Aug. 2 following was declared consul for life by a decree of the French senate.

Meanwhile Napoléon was busy superintending the drawing up of a code of civil laws for France. He assembled the first lawyers in the nation, under the presidency of Cambrérès, and frequently took part in their deliberations; the results of their labors were the *code civil des Français, code de procédure, code penal,* and *code d'instruction criminelle,* besides commercial and military codes, all of which often go loosely under the name of the *code Napoléon.* The first of these is an admirable production, and is in force to the present day. Considerable attention was besides paid to such branches of education as were likely to promote efficiency in the public service. Mathematics, physical science in all its departments, engineering, etc., were as vigorously encouraged as philosophy, ethics, and political speculation were discouraged. But the best proof that Napoléon wanted not an educated people, but only active and expert tools and agents, was the indifference that he manifested to primary and elementary education. In a population of 32,000,000, the number of pupils under 10 years is given by Fourcroy at only 75,000. The internal government was the acme of despotic centralization. Napoleon appointed all prefects of departments and all mayors of cities, so that not a vestige of provincial or municipal freedom remained. He ruled France as he ruled the army of France, and was already an emperor in almost everything but the name.

Peace between France and England did not last long. Napoléon's policy in Italy irritated the British government, and, as remonstrances were ineffectual, war was declared against France May 18, 1803. The English fleet scoured the seas, paralyzing the commerce of France; while Napoleon threatened to invade England, and assembled a large army at Boulogne. So utterly did he misconceive the character and condition of Englishmen that he felt sure (by his own statement) he should be welcomed as a liberator by the people. While these warlike preparations were going on occurred the dangerous conspiracy of the Chouan chief, George Cadoudal (q.v.), Pichegru (q.v.), Moreau (q.v.), and others. Its discovery (Feb., 1804) alarmed Napoléon excessively, and led to what has been considered one of the blackest deeds in his career—the murder of the duke d'Enghien (q.v.) on Mar. 20 following. He now appears to have felt it necessary to assume the title of emperor. France, he alleged, wanted an empire as a symbol of permanent security. An appeal was made to the nation. Upwards of 3,000,000 votes were given in favor of the proposed change in the form of government; only 3,000 or 4,000 against it. But where there is no municipal freedom, one does not know what value to put on votes. On May 18 Napoléon assumed the title of emperor at St. Cloud, and was crowned by, or rather in the presence of the pope (for Napoléon rudely crowned himself), on Dec. 2. In the following summer (May 26), he was also crowned king of Italy, in the great cathedral of Milan; and Eugène Beauharnais, his step-son, was appointed to the office of viceroy.

This policy of aggrandizement, which set at naught the conditions of the treaty of Lunéville, alarmed the other nations of Europe, especially Austria, who saw her Italian possessions seriously threatened. In 1805 a coalition was formed between England, Russia, Austria, and Sweden, mainly through the persevering policy of the first of these countries; and war again broke out in the month of September. Napoléon acted with amazing celerity. Concentrating his widely scattered forces at Mainz, he marched at once across Bavaria, compelled Gen. Mack to capitulate at Ulm with 20,000 men (Oct. 17), and on Nov. 13 entered the capital of Austria. France was electrified; the rest of Europe was thunder-struck. But a more glorious triumph was yet to come. The Russian army was already in Moravia, under the immediate command of the emperor Alexander I., and was there being joined by the scattered Austrian troops. Napoléon did not lose a moment. Hurrying north, he gave battle to the allies at Austerlitz on Dec. 2. The contest was tremendous, but the victory was complete. Napoléon's opponents were utterly crushed; and next day the Austrian emperor sought an interview, and sued for peace. A treaty was signed at Presburg on Dec. 26, by which Austria ceded to France all her Italian and Adriatic provinces; other changes effected by it were, the dissolution of the old German empire and the formation of the *Confederation of the Rhine* (q.v.).

In Feb., 1806, a French army conquered Naples, and the crown was conferred by Napoléon on his brother Joseph; in the following June another brother, Louis, was made king of Holland. Prussia now, when it was too late, assumed a hostile attitude. She had hung off, partly through fear and partly through selfishness, from the great anti-French coalition of the previous year, and now, when circumstances were almost hopelessly adverse, she madly rushed against her colossal enemy. Austria, with more magnanimity than prudence, lent her help, but the star of Napoléon was still in the ascendant. The battle of Jena (Oct. 14) absolutely annihilated the power of Prussia; five days later Napoléon entered Berlin, whence he issued (Nov. 21), his celebrated "decrees" against British commerce, hoping to ruin her by shutting out her ships from every harbor in Europe. His expectations, it need hardly be said, were disappointed. His policy well-nigh ruined the commerce of his own and other countries, but it only increased the prosperity of England. Her fleets and cruisers swept the seas; nothing could be got from the colonies save through her, and the merchants of the continent were obliged—in order to supply their customers as before—to let her carry on a vast contraband traffic. See Orders in Council.

After the capture of Berlin, Napoléon proceeded northwards to encounter the Russians, who were advancing to the help of Prussia. On his way he summoned Poland to rise, but only with partial success. At Pultask (Dec. 18, 1806) and at Eylau (Feb. 8, 1807) the French were beaten and driven back on the line of the Vistula; but after some months he received heavy re-enforcements, and on June 13 fought and won the great battle of Friedland, which led to the treaty of Tilsit, signed on July 7. By a secret article of this treaty, Russia promised to close her ports to British vessels. It is important to observe here that, as the military triumphs of Napoléon increased, the civil and political liberties of his subjects diminished. Consequent on the treaty of Tilsit, a decree of the imperial senate abolished the tribunate—the only political body in France that preserved the semblance of national self-government. In August, Napoléon created his brother Jerome sovereign of Westphalia—having patched up a kingdom for him in his usual unscrupulous way—and soon after entered on a war with Portugal—the beginning of the great peninsular war. The occasion of the war was the refusal of the prince-regent of Portugal to carry out the Berlin decree in regard to British shipping. In Mar., 1808, occurred that extraordinary instance of trepanning at Bayonne by which the whole royal family of Spain fell into the hands of Napoléon; and in the following July his "dearly beloved brother" Joseph was ordered to exchange the throne of Naples

for the "crowns of Spain and the Indies." His successor was the "handsome swordsman" (*beau sabreur*), Joachim Murat. Spain rose in insurrection, and an English force, under sir John Moore, was dispatched to its assistance. Napoléon invaded the country about the close of October, defeated the Spanish forces, and captured Madrid (Dec. 4). But his presence was urgently needed elsewhere, and he was forced to let Soult and other generals conduct the war in the peninsula. Austria, again irritated and alarmed at his aggressive policy, especially in Italy (where he had seized Tuscany and the states of the church), once more prepared for war, which broke out in the spring of 1809. Her army of Germany, commanded by the archduke Charles, was in splendid condition; but still fortune was adverse. Napoléon hurried into Bavaria, routed the archduke at Eckmühl (April 22), compelled him to retreat into Bohemia, and on May 12 entered Vienna for the second time. But the struggle was not over. The archduke rallied his scattered forces, worsted Napoléon in the terrible conflicts of Aspern and Essling (May 21 and 22), and drove him to take refuge for a time on an island of the Danube. The battle of Wagram (July 6), however, once more prostrated, or at least intimidated, Austria; and on Oct. 14 she signed the peace of Schönbrunn.

Napoléon appears to have now come to the conclusion that he could only put a stop to the hostile machinations of the old legitimate dynasties by intermarrying with some one of them. Besides, his wife Josephine had no children, and he was ambitious of perpetuating his power in his family. With that callousness to everything except his own interests, which is a prominent feature of his character, he immediately proceeded to divorce her. The act of divorcement was solemnly registered on Dec. 16. Less than three months afterwards he married Maria Louisa, archduchess of Austria. He was now at the zenith of his power, and so, according to the old Greek belief, Nemesis was on his track. What caused his ruin was really that outrage on civilization, the Berlin decrees. Russia found it impossible to carry it out, without permanent injury to her great landowners; Sweden and other countries were in a similar predicament. This led to evasions of the decree, and these, again, involved Russia particularly in further complications, until finally, in May, 1812, Napoléon declared war against her and, in spite of the advice of his most prudent counselors, resolved to invade the country. Every one knows the dreadful history of the Russian campaign. Napoléon—wringing contingents from all his allies, Germans, Austrians, Italians, Poles, and Swiss—concentrated between the Vistula and the Niemen an army of half a million of men. The vast horde crossed the latter river (June 24 and 25) in three divisions, captured Wilna (June 28), and ravaged Lithuania. The Russian generals retreated before the invading host, deliberately wasting the country and carrying off the supplies, but avoiding, as far as possible, all engagements; their design being to surround Napoléon in the heart of the country, and by the help of famine and the rigors of a northern winter to annihilate him in his hour of weakness. Napoléon followed up the retreating foe with reckless resolution. He risked everything upon the chance of striking some overwhelming blow. The horrors of his march—in Lithuania alone 100,000 dropped off (dead, sick, or captured by the swarms of Cossacks that hung upon his flanks)—are too familiar to require description. When he reached Smolensk (Aug. 16), the Russians had just left it—on fire. Three weeks or so later he made up on the enemy at Borodino, where an obstinate and bloody battle was fought (Sept 7). The French remained in possession of the field, but of nothing else. A week after Napoléon entered Moscow, hoping to find rest for a time in the ancient metropolis of the country. But the city was deserted by its inhabitants; and on the 16th a fire broke out, which raged till the 19th and left Moscow a heap of ruins. After five weeks' stay, Napoléon was obliged to commence his retreat (Oct. 19). His army was reduced to 120,000 men. The winter set in much earlier than usual, and he had to return through the very districts which had been wasted on his advance. When he left Smolensk (Nov. 14), he had only 40,000 fighting-men; when he crossed the Beresina (Nov. 26 and 27), he had not more than 25,000. With the excuse—which was in itself no doubt true—that his presence was urgently needed in France, he now abandoned the miserable remains of his army; and on Dec. 5, leaving Murat in command, set out in a sledge for Paris, where he arrived on the 18th of the same month. He instantly set about a fresh conscription; and in the spring of 1813 marched into Germany at the head of 350,000 men; but the Russian campaign had broken the spell of terror which his name had till then exercised. The spirit of all Europe was thoroughly roused. A conviction was, somewhat unconsciously, seizing every mind (at the close of the campaign of 1814 even France shared it) that the world had had "enough of Bonaparte" (*assez de Bonaparte*). Prussia, in particular, was burning to wipe out the disgrace of Jena and all the bitter humiliations to which she had been subsequently subjected. The victories of the British in Spain, the fame of which was spreading all over the continent, also proved to her that French soldiers *could* be beaten, not once or twice only, but through whole campaigns. An alliance was formed between the king of Prussia and the emperor Alexander. At first Austria remained neutral, but afterwards she joined the coalition. Napoléon's military genius, it has been often remarked, never showed to greater advantage than in this and the next campaign, which cost him his crown and his liberty. He was for some months successful in winning battles—at Lützen (May 2), Bautzen (May 21), and Dresden (Aug. 24, 25, and 27); but the invincible temper of the allies, who knew that he was playing his last card, made these victories almost fruitless. They were convinced that

one grand defeat would neutralize all his triumphs. This was inflicted, after several minor defeats, at Leipzig—the great *battle of nations*, as it has been called (Oct. 16, 18, and 19). The result justified their expectations—Napoléon was hopelessly ruined! He commenced his retreat towards France, followed by the allies When he recrossed the Rhine, he had only 70,000 or 80,000 men left out of his 350,000. All the French garrisons in the Prussian towns were compelled to surrender. Napoléon appeared at Paris Nov. 9; and though great discontent prevailed in the country, and a spirit of opposition showed itself even in the legislative body, the senate decreed, at his bidding, another conscription of 300,000 men, with which Napoléon began, in Jan., 1814, to attempt to drive the allies out of France. The skill and energy which he displayed were extraordinary, but they only marked the intensity of his despair. On Mar. 30 the allied forces captured, after a severe engagement, the fortifications of Paris; next day the emperor Alexander and the king of Prussia entered the city, *amid the shouts of the populace;* on April 4 Napoléon abdicated at Fontainebleau. He was allowed to retain the title of emperor, with the sovereignty of the island of Elba, and an income of 6,000,000 francs, to be paid by the French government. A British ship conveyed him to Elba, where he arrived on May 4.

After a lapse of ten months, most of which was spent in intrigues, Napoléon made his escape from the island, landed near Frejus on Mar. 1, 1815, and appealed again to France. The army went over to him in a body, and several of his marshals, but the majority remained faithful to Louis XVIII. On Mar. 20 he reached Paris, reassumed the supreme power, promised a liberal constitution, and prepared once more to try the fortune of battle with the allies. At the head of 125,000 men, he marched (June 15) towards Charleroi, on the Flemish frontier, where the English and Prussian forces were assembling. The duke of Wellington, who, the year before, had completed the deliverance of Spain, was appointed by the congress of Vienna commander-in-chief of the armies of the Netherlands. The campaign lasted only a few days. On the 16th Napoléon defeated the Prussians, under Marshal Blücher, at Ligny, which compelled Wellington to fall back on Waterloo, where, on the 18th, was fought the most memorable and decisive battle of modern times. It resulted in the utter and irretrievable ruin of Napoléon. The despot, who knew what awaited him—for France had *not* recalled him from Elba; he came at the desire of a faction, whose interests were identical with his—returned to Paris. The house of representatives fiercely insisted on his abdication. He did so (June 22) in favor of his son, Napoléon II.; they further demanded that he should leave the country forever, and he retired to Rochefort, with the design of embarking for the United States. On July 7 the allies again entered Paris, and refused to acknowledge the acts of the French provisional government. Napoléon, who saw that he could not escape either by sea or land, voluntarily surrendered (July 15) to Capt. Maitland of the *Bellerophon,* claiming the protection of British laws. It was, however, resolved by the British government to confine him for life on the islet of St. Helena, a lonely rock in the southern Atlantic, 1000 miles from the coast of Africa. He was conveyed thither by Admiral Cockburn, and landed at St. Helena Oct. 16, 1815. The remainder of his life was politically insignificant. His chronic quarrels with his governor—or *jailer,* as the French prefer it—sir Hudson Lowe; his conversations with friends and visitors about his past career; his deliberate attempts to falsify history in his writings, are familiar to every one. After more than a year of bad health, he expired, May 5, 1821. He was buried with military honors. In 1840 his remains were removed to France, and deposited in the *Hôtel des Invalides.* See Bonaparte, Family of.

Napoléon II., son of Napoléon Bonaparte. See Reichstadt, Duke of.

Napoléon III., nephew of Napoléon Bonaparte. See Louis Napoléon.

Napoléon, or, in full, Napoléon Joseph Charles Paul Bonaparte, was the son of Jerome, king of Westphalia, and was b. at Trieste, Austria, in 1822. When the insurrection broke out in the Romagna in 1831, he was staying in Rome with his grandmother, Mme. Letitia Bonaparte, but was forced to leave the city for Florence on account of his cousins (see Louis Napoléon) being implicated in the revolutionary disturbances. He was educated at a boarding-school in Geneva, and at the military school of Ludwigsburg, in Würtemberg, completing his studies in 1840, after which he traveled for five years in Germany, England, and Spain. In 1845 he obtained permission to visit Paris under the name of the comte de Montfort; but his relations with the democratic party and his advanced political opinions rendered him suspected by the government, who ordered him to quit the country. He, however, again made his appearance on the eve of the revolution of Feb., 1848. After the fall of Louis-Philippe he offered his services to the provisional government, and was elected by the Corsicans a member of the constituent assembly, where he voted with the moderate republicans. He held for a short time, in 1849, the office of minister-plenipotentiary at Madrid. After the *coup d'état* he withdrew into private life; but on the restoration of the empire he reappeared to share in the honors that now fell thickly on his family. By a decree of the senate, Dec. 23, 1853, he was pronounced a French prince, with the right to a place in the senate and the council of state; at the same time he received the insignia of the grand cross of the legion of honor, and—though he had not served—the rank of gen. of division. In the Crimean war he commanded a division of infantry reserves at the battles of Alma and

Inkerman, but soon after returned to France, on the plea of ill-health. Napoléon was president of the imperial commission of the Paris exhibition in 1855. In 1858 he was appointed head of the ministry for Algiers and the colonies, but held the office only for a short time. During the same year he married the princess Clotilde, daughter of Victor Emmanuel, and in the Italian war of 1859 commanded the French army of reserve in the south of Italy, but was not engaged in actual hostility. In 1861 he made a speech in the senate reflecting on the Orleans family, for which he was challenged by the duc d'Aumale. The challenge was not accepted, much to the disgust of the French army. Napoléon was president of the French commission at the London exhibition of 1862. In 1865 he resigned several public appointments, owing to a reprimand from the emperor about a speech. Afterwards, however, he was intrusted with many delicate missions, and urged the emperor to a liberal policy. In 1876 he was returned to the French assembly for Corsica, but in 1877 was rejected. In 1880 he publicly applauded the decrees against the religious orders, but in 1883 posed as a champion of the church in a manifesto calling for the plebiscite. He was arrested, but released after a month's imprisonment. He died in 1891 at Rome.

NAPOLÉON-VENDÉE, Bourbon-Vendée, or La Roche sur Yon, a t. of France, the capital of the department of Vendée, pleasantly situated on a hill on the right bank of the Yon, 38 m. s. from Nantes. The town has no manufactures and little trade, but derives its importance chiefly from its being the seat of departmental administration. The town contained only 800 inhabitants when Napoleon I. selected it for the capital of the department, granted great sums for its improvement, and called it *Napoléon-Vendée*, changed to *Bourbon-Vendée* at the restoration of the Bourbons, the former name coming again into use under Napoleon III. It is now known as *La Roche sur Yon*. Pop. 9,100.

NAPOLI DI ROMANI'A. See Nauplia.

NARA, the ancient capital of Japan during the reign of seven mikados, four of whom were women. This most interesting town lies 22 m. s.s.e. of Kioto, and contains a pop. of 23,300, a mere fraction of its former number. From 708 to 782 Nara was the national seat of art, letters, religion, and government, being visited by envoys from China, Siam, India, and Corea. Libraries, monasteries, and temples flourished. Among the relics of the past extant are the monster bell, 13½ ft. high, 9 ft. in diameter, 8 in. in thickness, and weighing 36 tons; and the colossal gilded bronze image of Buddha, 53 ft. high. The industries of Nara in the manufacture of fans, silk, lacquer, cloisonné enamel or porcelain, etc., are still famous. Mikasa Yama (the hill of the three hats), near by, is a natural feature, famous in native poetry and art, being frequently depicted on fans, cabinets and scroll paintings.

NARAKA is the hell of the Hindus. Manu (q.v.) enumerates 21 hells or divisions of Naraka, and gives a general description of the tortures which await the impious there. The Purânas, however, are more systematic. The Vishnu-Purâna, for instance, not only names 28 such hells, but distinctly assigns each of them to a particular class of sinners. Thus, a man who bears false witness is condemned to the hell *Raurava* (i.e., fearful); the murderer of a Brâhman, stealer of gold, or drinker of wine, goes to the hell *Súkara* (i.e., swine), etc. Besides these twenty-eight which the Purâna knows by name, we are told of "hundreds and thousands of others in which sinners pay the penalty of their crimes."

NARBONNE, a t. in the s. of France, in the department of Aude, 93 m. e.s.e. of Toulouse, on a branch (La Robine) of the canal du Midi. It is the *Narbo Martius* of the Romans; but there is reason to believe that it was well known to the Greeks 500 years before the Christian era. It was colonized by the Romans 118 B.C., and probably got the designation Martius from Q. Marcius Rex, one of the consuls at the time. Situated only about 8 m. from the sea, on the direct road into Spain and into the basin of the Garonne, Narbonne was in early times a place of great commercial prosperity. It was the second settlement founded in south Gallia by the Romans, and was considered by them an important acquisition, both for its strength and as the key to the road into Spain. Under Tiberius it flourished greatly, the arts and sciences being cultivated with success, and its schools rivaling for a long time those of Rome. About 309 A.D. it became the capital of Gallia Narbonensis, and contained among other buildings a capitol, theatre, forum, aqueducts, triumphal arches, etc. It was taken in 719 by the Saracens, who planted here a Moslem colony, and destroyed the churches. In 859 it fell to the arms of the Northmen. During the 11th and 12th centuries it was a flourishing manufacturing city, rivaling Marseilles itself, but subsequently it fell into comparative decay. The projected Atlantic-Mediterranean ship canal has its eastern terminus near the town. A considerable number of architectural fragments—as capitals, marble slabs with inscriptions, friezes, etc.— have been found. The present town contains the cathedral of St. Just, founded in 1271, with towers 194 feet high, and also the Hôtel-de-Ville, once an archbishop's palace, but now used as a library and museum. The chief products are honey, salt, tiles, sulphur and red wine. Pop. '91, 29,566.

NARCISSUS, according to a Greek fable, was the son of the river-god Cephissus and of the nymph Liriope or Liriœssa of Thespiæ, in Bœotia. He was a youth of extraordinary beauty, of which he was excessively vain; and for this he was punished by

Nemesis, by being made to fall in love with himself on seeing the reflection of his own face in a fountain. He died of this love-sickness; and on the place where he died sprung up the flower which bears his name. The story of Narcissus, finely narrated by Ovid, is of comparatively late origin.

NARCISSUS, a genus of plants of the natural order *amaryllideæ*, having a perianth of six equal petal-like segments, and a bell-shaped corona of various magnitude. The species are natives of the s. of Europe, the n. of Africa, and the temperate parts of Asia. The common daffodil (q.v.) is the only one which can be regarded as truly a native of Britain. Many are cultivated in gardens for the sake of their beautiful and often fragrant flowers, which in general appear early in the season. Some of them are known by the names of daffodil (q.v.) and jonquil (q.v.). The name narcissus is popularly restricted to those which have flat—not rush-like—leaves, and a short, not bell-shaped corona. Of these, one of the best known is the poet's narcissus (*N. poeticus*), with generally one-flowered scape, the flower white and fragrant, the corona with a deeply-colored border; others, with one or two flowers on the scape, are in common cultivation.—The Polyanthus Narcissus (*N. Tazetta*) has a number of flowers on the scape. It grows wild in stony places near the Mediterranean and eastwards to China. Many varieties of it are in cultivation. It is not only grown in gardens and green-houses, but in water-glasses, like the hyacinth. It is very common in gardens in India, where it is highly esteemed as a flower. The narcissi in general are propagated either by seed, or by offset bulbs. They succeed best in a rich light soil.

NARCOT'ICS (Gr. *narkē*, stupor) are remedies which, in moderate doses, lessen the action of the nervous system. Their full operation is sleep or coma. Opium is the type from which most descriptions of this class of medicines have been drawn; but although most narcotics more or less resemble opium in their action, almost every one presents some peculiarity in the way in which it affects the system. These medicines are primarily stimulating, especially when given in small or moderate doses; but this stage of their action is comparatively short; and when the dose is large the excitement is scarcely perceptible. Their power of inducing sleep has procured for them the names of hypnotics and soporifics; while many of them are termed anodynes, from their possessing the property of alleviating pain. Next to opium, henbane, Indian hemp, and aconite may be regarded as the most important narcotics. It has been already mentioned that there are differences in the mode of operation of the different members of this class. "Some dilate, while others contract the pupil; some appear to concentrate their sedative action more particularly upon the functions of the encephalon, others upon the contractile power of the alimentary and bronchial tubes, while a strict distinction is to be drawn between those which occasion constipation and those which do not; all these things being of great practical importance."—Ballard and Garrod's *Elements of Materia Medica*, p. 13.

Narcotics are usually administered either with the view of inducing sleep or of alleviating pain or spasm. As, however, their action is much modified by a variety of circumstances—such as age, idiosyncrasy, and prolonged use—they should be administered with extreme caution; and, as a general rule, only under competent advice. The various quack medicines for children which are known as *carminatives, soothing syrups*, etc., contain some form of opium, and are a fertile cause of the great mortality that occurs in early life, especially among the poorer classes.

It is almost unnecessary to add that all the narcotics when taken in excess are poisonous.

NARCOTINE, $C_{22}H_{23}NO_7$, is one of the organic bases or alkaloids occurring in opium, in which it usually exists in the proportion of 6 or 8 per cent. It is nearly insoluble in water, but dissolves readily in alcohol, ether, and chloroform. Its ethereal solution, when submitted to spontaneous evaporation, yields it crystallized in colorless acicular groups or in rhombic prisms. A mixture of concentrated sulphuric and nitric acids produces a dark-red color with narcotine and its compounds. Narcotine possesses very slight alkaline properties; its salts do not readily crystallize, and are even more bitter than those of morphia, although the substance itself is almost tasteless. When first discovered (in 1803), it was supposed to be the stimulant principle of opium; but in reality it possesses very little activity. It has been prescribed in gradually increased doses up to a scruple, without the least injury. Its sulphate has been used in India as a substitute for quinine; and nearly 200 cases of intermittent and remittent fevers, treated by it with success, have been published by Dr. O'Shaughnessy.

NARD AND NARDOS'TACHYS. See Spikenard.

NAR'DO (anc. *Neretum*), a t. of South Italy, in the province of Lecce, 24 m. w. of Otranto. Nardo manufactures snuff from tobacco grown in the neighborhood, and also produces wine and oil. The surrounding country abounds in olive plantations. Pop. 10,700.

NARDOO, *Marsilea quadrifida*, a plant of the acotyledonous natural order *marsileaceæ* (q. v.), the only plant of that order which is used in any way by man. It has but recently become known to botanists. It is found in Australia, and affords important supplies of food to the natives of some regions; it has also been of great use to some recent exploring-

parties. It grows in places occasionally covered with water; vegetating while moisture abounds, and then exhibiting abundance of green clover-like foliage, the leaves consisting of three leaflets at the top of a stalk some inches in length. When the water dries up the remains of the plants are often covered with dried mud. It is then that the spore-cases are gathered for food. They are oval, flattened, about an eighth of an inch in length, hard and horny, and requiring considerable force to pound them when dry, but becoming soft and mucilaginous when moistened. The spore-cases, pounded with their contents, are made into cakes like flour.

NAR'DUS, a genus of grasses, having a simple spike, spikelets all on one side, no glumes; each spikelet consisting of one floret, which has two paleæ, the outer ending in a long point. *N. stricta* is one of the most common of British grasses, growing in dry elevated situations, and very characteristic of them. It grows in tufts, and is often called MAT-GRASS. It is perennial, purplish, short, rigid, and very worthless, as almost no animal but the goat will eat it.

NARES, EDWARD, D.D., 1762–1841 ; b. England ; son of Sir George Nares and cousin of Robert Nares ; was educated at Christ Church, Oxford, and became a fellow of Merton college in 1788. Ten years later he became rector of Biddenden, in Kent; and in 1814 regius professor of modern history at Oxford. He wrote, among numerous works: *On the Plurality of Worlds; Discourses on the Three Creeds; Evidences of Christianity; Elements of General History; Heraldic Anomalies; Memoirs of the Life and Administration of William Cecil, Lord Burghley;* and a novel entitled *Thinks I to Myself,* which passed through several editions in 1811.

NARES, JAMES, 1715–83 ; b. Stanwell, Middlesex, England; studied music under Bernard Gates and the famous Dr. Pepusch at King's chapel, London. In his nineteenth year he became organist of the York cathedral. He published *Lessons for the Harpsichord* in 1748; was made doctor of music at Cambridge in 1755; was appointed organist to George II., and removed to London in 1756; was made master of choristers in 1757, and resigned the position in 1780. He published *Catches, Canons, and Glees,* dedicated to the earl of Mornington, 1778; also his *Twenty Anthems in Score,* which still continue in use. His works show a thorough knowledge of the science of music.

NARES, ROBERT, 1753–1829 ; b. England ; son of James Nares, an organist and musical composer, studied at Oxford; in 1778 took orders, and soon became rector of Sharnford, Leicestershire, and preacher at Lincoln's Inn. As critic, essayist, and theologian he held a high rank among the writers of his time; was archdeacon of Stafford 1799, rector of St. Mary's, Reading, canon of Lichfield, and for sometime rector of Allhallows church, London. Associated with the Rev. William Beloe he founded the *British Critic,* which he assisted in conducting for four years as a high-church literary review, conservative in principle, and opposed to the dogmas of the sympathizers with the French revolution. He was at one time assistant librarian of the British museum. He was a contributor to the *Classical Journal,* and published, in 1784, *Elements of Orthoepy,* and in 1805, *Chronological View of the Prophecies relating to the Christian Church.* One of his most important works is *A Glossary of Words, Phrases etc., in the Works of English Authors of the Age of Queen Elizabeth,* new edition 1861. In 1815 he published the *Veracity of the Evangelists Demonstrated.* In 1823 he was vice-president of the royal society.

NA'REW, a river of w. Russia, an affluent of the Bug, rises in the government of Grodno, and flows w.s.w to the main stream, which it joins at Sierock, after a course of 300 miles. The waters of the Narew are about as great in volume as those of the Bug. It is navigable to Tykoczin, 150 m. from its mouth.

NARNI, a t. of the province of Perugia, Italy, about 45 m. n.e. of Rome, 7½ m. from the city of Terni, situated on a precipitous hill on the left bank of the Nar. Pop. 3,000. The Romans colonized the place and gave it the name of Narnia about 300 B.C., and it was a military post on the Flaminian way. Ruins of a massive marble bridge built by Augustus and of a very ancient aqueduct are still to be seen. Narni has been the seat of a bishopric since 360, and the cathedral dates from the 13th c.; the only other buildings of interest are the castle and convents. In the 9th c. the town was seized by the duke of Spoleto, and in the middle ages was burned and laid waste. Pope John XVIII. and the emperor Nerva, 98 A.D., were natives of Narni.

NA'RO, a t. of Sicily, in the province of Girgenti, and 12 m. e. of the town of that name. The altitude of the town is 1945 ft. and it has 10,400 inhabitants. Numerous tombs, medals, and other antiquities have been found here.

NARRAGANSETT BAY, an inlet of the Atlantic Ocean, e. of Kent and Washington counties, R. I., extending n 28 m. to Bullock's Point, 6 m. from Providence, and w. from Seconnet to Point Judith, 12 m., and with a width never less than 2 miles. The Pawtucket, Pawtuxet, Providence, and Taunton rivers empty into it, and it contains a number of islands, of which Rhode Island, Providence, and Canonicut are the most important. Newport is at its s. extremity; Bristol and Warren are on its shores. It is navigable by large vessels to Providence. The n. part is called Providence bay.

NARRAGANSETT PIER, a district in Washington co., R. I.; taken from South Kingston, and given all the powers of a town excepting representation in the General assem-

bly, 1888; 7 miles e. of Kingston and 7 miles s.w. of Newport. It is delightfully situated on the w. shore, near the mouth of Narragansett bay, and has an excellent beach. It is a popular summer resort. Excellent facilities for fishing and boating are amply provided, and it is celebrated for its fine drives and scenery. It has a number of fine private summer residences and many hotels. Three miles from the pier are Narragansett heights, 400 ft. above the bay, commanding a magnificent view, and on the rising ground near the most fashionable hotel is Silver lake, a beautiful sheet of water embowered in trees. A line of street cars connects the heights with the beach. Pop. '90, 1,408.

NARRAGANSETTS, a tribe of Indians that inhabited Rhode Island and the western shore of Narragansett Bay ; after whom the latter was named. They were originally a part of, and spoke the dialect of the Algonquins. They were friendly towards the colonists, their wars being waged generally against other Indian tribes. Canonicus, their chief sachem, warmly befriended Roger Williams, and gave him a large tract of land. In 1636 king Philip, chief of the Pequots, sought alliance with the Narragansetts, which Roger Williams prevented by appearing, at the risk of his life, in the camp of the latter while the Pequots were there. Canonicus died in 1647. In 1675 the Pequots sent their women and children to the Narragansetts for protection, while they attacked the people of Swanzey. The people of Boston and Plymouth at this time extorted a treaty of peace from Canonchet, the last chief of the powerful Narragansetts. King Philip, having spread havoc through the valley of the Connecticut, returned to Rhode Island, when the Narragansetts joined him, violating their treaty. The colonists, to punish the Indians for their treachery, attacked them in an immense swamp in the southern part of Rhode Island, where several tribes, including the Narragansetts, had built their wigwams and gathered together their families and supplies for the winter, their fort being on an island in the swamp. The whites burned 500 of their wigwams, and their provisions, men, women, and children perishing in the flames. Canonchet was made prisoner and killed. After this war only a few of the Narragansetts were left; these intermarried with the colonists, and became civilized. A few of the tribe still remain in the region of Charlestown, R. I.

NARSES, a celebrated statesman and gen., and almost the last stay of the old Roman empire in Italy, was b. toward the last quarter of the 5th century. The place of his birth is uncertain. His parentage was obscure, and he was probably sold as a slave in childhood, having, according to the barbarous usage of the period, been previously emasculated. From some menial office in the imperial household at Constantinople, he rose by successive steps to the post of *cubicularius*, or private chamberlain of the emperor Justinian, and ultimately to that of keeper of the privy purse. In the difficult art of courtiership, Narses long maintained a pre-eminence. More remarkable, however, considering his condition, was the distinction which he attained in military affairs. In 538 he was sent to Italy in command of a body of troops, professedly to act in concert with Belisarius (q.v.); but in reality, it is conjectured, with a secret commission to observe and control that general. After some successes, Narses, having disputed with Belisarius, assumed an independent authority; but his separate command was unfortunate, and he was recalled to Constantinople in 539. After some years, however, Belisarius was recalled, and Narses was appointed to the chief command in Italy. His conduct of that expedition extorted the admiration even of his enemies, Not having the command of a sufficient number of transports, he marched his army along the whole circuit of the shore of the Adriatic, and while the enemy's fleet were still in possession of the sea, was enabled to encounter them in the plain of Sentaglio, near Tagina, where, after a desperate engagement, the Goths were totally defeated, and their king, Totila, slain. Narses took possession of Rome, and after a series of successes both in southern and northern Italy, completely extinguished the Gothic power in that peninsula. Justinian appointed Narses exarch of Italy in 553. He fixed his court at Ravenna, and continued, till the death of Justinian, to administer the affairs of Italy with a vigor and ability which did much to stay the progress of that decay which had long infected all its social, political, and military institutions. The only blot on the character of his administration is the avarice with which he is charged by his contemporaries. His exactions pressed heavily on the exhausted resources of the population; though their severity may be in some degree palliated by the splendor and utility of the public works on which he partly expended the public resources. On the death of Justinian, his ascendency came to an end. The Romans, on the accession of Justin, complained to him of the exactions of Narses, and that emperor deprived him, in 565, of his office; a proceeding to which a special indignity was imparted by an insulting message from the empress, that it was time for him to "leave arms to men, and to spin wool among the women of the palace." To this bitter taunt (according to Paulus Diaconus, *De Gest. Long.* ii. 6), Narses replied that he would "spin for her a thread which she would find it hard to unravel;" and he is accused of secretly intriguing with Alboin, king of the Lombards, to incite a new invasion of Italy, at the same time submissively offering his services to the emperor for the purpose of repelling the invasion. This account, however, seems uncertain, and perhaps improbable; and as Narses died at Rome in 568, just on the eve of the Lombard invasion, no light is thrown upon this story by the actual events of the war. His

age at the time of his death is a subject of much curious controversy. According to the popular account, it was no less than 95 years; but this is doubted by most of the historians.

NAR'THEX, a part of the early Christian churches separate from the rest by a railing or screen, and to which the catechumens and penitents were admitted.

NARUSZE'WICZ, Adam Stanislaf, 1733–96; b. Lithuania. After completing his studies at the university of Vilna, in 1748, he entered the order of Jesuits, traveled through Germany, France, and Italy, and on his return became director of the Jesuit college of Warsaw, and a friend of king Stanislaf-August. Upon the suppression of his order he was appointed coadjutor to the bishop of Smolensk in 1788, secretary of the council, and finally bishop of Lutsk. After the death of the king he resided in Janovisc (Gallicia), where he died. His chief work is the *History of the Polish Nation*, in 10 vols., which gained for him the title of the Polish Tacitus. He published also an excellent translation of Tacitus, a *History of the Crim-Tartars;* a *Life of Khodkiévitch Hetman of Lithuania;* and 4 vols. of poems, odes, satires, fables, etc.

NARVA, a Russian t. in the gov., and 100 m. by rail w. of St. Petersburg, is situated on the Narova, 8 m. from its mouth in the gulf of Finland. It was founded in 1256 by Waldemar II., king of Denmark, and came into the possession of Russia in 1704. The navigation of the Narova is impeded by a waterfall near Narva, 14 ft. high. There are several old churches and an ancient town-hall. The port is visited annually by about 200 foreign vessels and largely exports corn. Here, in November, 1700, Charles XII., with 8,000 men, defeated a Russian army of 60,000 men under Peter the Great and the duke of Croy. Pop. '91, 11,400.

NARVAEZ, Pánfilo de, 1478–1528; b. Spain; sailed for the West Indies not long after the discoveries of Columbus. In 1501 he was in Santo Domingo, in the conquest of which, as also of Jamaica and Cuba, he participated; and in the reduction of the latter he was second to Velasquez, the governor, in command of the Spanish forces. In 1520 Velasquez sent him on an expedition to Mexico to bring Cortes to submission, and with orders to arrest him and take his place in the government of the country. But Cortes fell upon him at Zempoalla, and took him prisoner; and Narvaez lost an eye in the battle. He was imprisoned by Cortes for five years; but his adherents joined the army of Cortes and took part with it in the battles which resulted in the conquest of Mexico. On his liberation Narvaez returned to Spain, and attempted in vain to induce the government to punish Cortes. He succeeded, however, in obtaining an extensive grant of land in America, and arrived at Tampa Bay in 1528 with a force of 400 men whom he intended to settle somewhere in Florida. He went on to Appalachee, but was met everywhere by the bitter hostility of the natives; and the country, contrary to his expectations was sparsely settled and poor. He reached the sea-coast, and attempted to go to Mexico in boats; near the mouth of the Mississippi his boat was sunk, and he was drowned. Only a few of his companions, after suffering great hardships for nearly 8 years, succeeded in reaching Sonora, whence they went to Mexico.

NARVAEZ, Ramon Maria, Duke of Valencia, a Spanish general and statesman, was b. at Loja, in Andalusia, Aug. 5, 1800, and when very young served in the war of liberation against the French. He was an officer in 1820, when constitutional government was re-established in Spain; and in 1822, when a reactionary party of the royal guard took up arms to destroy the work of the revolution, Narvaez ranged himself on the side of the liberals, and contributed by his courage to the repression of the mutiny. Shortly after, under the command of Mina, he made the campaign of Catalûna against the guerrillas, who were assisted by the monks. The invasion of Spain by a French army in 1823 forced him to retire from active life. He withdrew to Loja, and lived there in obscurity until the death of Ferdinand VII. in 1832. In 1834, as capt. of chasseurs, he maintained a hot struggle against the Carlists of the Basque provinces, and signalized himself in various engagements. In 1836 he commanded a division under the orders of Espartero, and in November of that year completely routed the Carlist leader Gomez, near Arcos. This was a decisive moment in his career. He now became immensely popular, aspired to the highest offices of the state, and was regarded as the rival of Espartero. In 1838, by acts of terrible severity, he cleared the district of La Mancha of brigands, and was appointed in 1840 capt.gen. of Old Castile, and general-in-chief of the army of reserve. When Espartero gave Gen. Alaix a place in the ministry, Narvaez resigned his command. He took part in the insurrection against Espartero that broke out at Seville in 1840, but that having failed, he was compelled to flee to France, where he was shortly after joined by queen Christina (see Maria Christina), and commenced those plots against the government of Espartero which, in 1843, effected its overthrow. In 1844 he was appointed president of council and created duke of Valencia. His ministry was thoroughly reactionary. He recalled Maria Christina, and revised the liberal constitution of 1837. The progressista party was dissatisfied, and petty insurrections broke out, which the rigorous soldier-statesman repressed with an iron hand. But his dictatorial manners finally alienated even his personal friends, and his ministry was over-

thrown (Feb. 10, 1846). After a brief exile as special ambassador at the French court he returned to power in 1847, but soon afterwards quarreled with queen Christina, and found it necessary again to retire from office in 1851. In 1856, on the overthrow of O'Donnell's ministry, he again became president of council, and immediately commenced to strengthen the royal authority and to restrict the liberty of the press. The intrigues of the court compelled his resignation in 1857. He returned to power in 1864, and (1865) was succeeded by O'Donnell, with whom he suppressed, in 1866, a military revolt in Madrid. He replaced O'Donnell in the same year, and, despite the efforts of O'Donnell and Prim, retained power till his death in 1868.

NARWHAL, *Monodon,* or *narwhalus,* a genus of *cetacea,* of the family *delphinidæ,* resembling *beluga* (q.v.) in form and in the want of a dorsal fin, but remarkably characterized by having no teeth at all, except two in the upper jaw, supposed to be canines, which sometimes remain quite rudimentary, even in the mature animal, as they are in the young, and sometimes developed into great spirally twisted straight tusks, passing through the upper lip, and projecting like horns in front. Only one species is ascertained, *M. monoceros* or *N. vulgaris;* the other species which have been described by naturalists having been founded on exaggerations and untrustworthy observations. It inhabits the Arctic seas, and is very rarely found so far south as the Shetland isles, although an accidental wanderer has reached the coast of England. Narwhals are often seen in great numbers among the ice-fields, and in the creeks and bays of the most northern coasts. They commonly associate in small herds. The tusks are much more frequently developed in the male than in the female, but in the female also they sometimes attain a large size. It is but rarely that both tusks are largely developed, although they sometimes are so, and then diverge a little; one of them generally continues rudimentary or attains a length only of a few inches, whilst the other becomes a great horn, projecting straight in front, from which the animal has received the name of Sea Unicorn. A mature narwhal is generally about 15 or 16 ft. in length, without reckoning the tusk, which is from 6 to 10 ft. long. The body is less thick than that of the beluga; the head is small, the forehead rises abruptly, the muzzle is very obtuse, the upper jaw projects a little; the first half of the body is nearly cylindrical, the remainder to the tail fin is conical. The tusk is hollow nearly to the point. Its use is rather conjectured than known. It is probably a weapon of defence, but Scoresby has suggested that it may be also used for breaking thin ice in order to obtain opportunity for respiration; and for killing fish, as he found remains of skates and other flat-fish in the stomach of a narwhal, which it is not easy to imagine how a toothless animal, with rather small mouth and lips, could capture and swallow, unless the formidable tusk were first employed. Cephalopodous mollusks, however, are believed to constitute a principal part of the food of narwhals. The narwhal is a very active animal, swimming with great rapidity, lively, and playful. A group of narwhals playing together, projecting their great horns from the sea, and crossing them in their sport, is a very interesting sight. The narwhal is pursued by the Greenlanders and other inhabitants of the north, for the sake of its blubber, with which its whole body is invested to the thickness of about 3 in., amounting to nearly half a ton in weight, and yielding a large proportion of excellent oil. The tusks are also valuable, being of an extremely compact white substance—denser, harder, and whiter than ivory—which is used as a substitute for ivory. The kings of Denmark have long possessed a magnificent throne of this material, which is preserved in the castle of Rosenberg. The flesh of the narwhal is used by the Greenlanders as food. Great medicinal virtues were formerly ascribed to the tusks. See illus., Whale, etc., vol. XV., fig. 1.

NASA'LIS, or Proboscis Monkey, *Nasalis larvatus,* a monkey allied to the *douc* or *semnopitheci,* but distinguished from all other monkeys by an extreme elongation of nose, that organ being nearly 4 in. in length in the mature animal. In the young the nose is comparatively undeveloped. The nostrils are placed quite at the extremity of the nose, and are separated merely by a thin cartilage. Of what use the magnitude of its nose is to the animal is unknown. The nasalis inhabits Borneo and neighboring islands. It is gregarious. It is an animal of about 3 ft. in height if placed erect a position it does not often assume. It can leap 15 ft. or more. Its fur is thick, not long, nor woolly; chestnut red, and in some parts golden yellow. See illus., Monkeys, etc.

NASCAPEES', or Nascapis, a tribe of Indians inhabiting Labrador, of the Algonkin family, of whom very little is known, as missionary effort has had small influence among them, and there has been little other opportunity offered for investigating their history or their manners and customs. No linguistic works concerning them have been published, though grammars of their language are said to be in existence in manuscript. The number of the Nascapees was estimated in 1870 to be about 2,860.

NAS'CENT STATE, in chemistry. When an element or compound is liberated from some chemical combination in which it had previously existed, the element or compound so liberated is at the moment when it escapes said to be in a nascent state; and it is *then* often capable of exerting far more powerful combining action with other bodies than it can exhibit when brought in contact with them *after* it has been liberated. Arsenic and hydrogen will not directly combine if brought in contact with one another under ordinary circumstances, but the application of Marsh's test (see Arsenious Acid) depends upon the direct union of the nascent hydrogen (liberated by the decomposition of the water) with

the arsenic, giving rise to arseniureted hydrogen gas. Again, if hydrated protoxide of nickel, $NiO \cdot H_2O$, be suspended in a solution of caustic potash, $K_2O \cdot H_2O$, it will undergo no change if a current of oxygen gas be passed through the solution; but if a current of chlorine be substituted for the oxygen, the whole of the metallic protoxide will be converted into the brown sesquioxide, Ni_2O_3, the resulting decomposition being shown in the equation:

Hydrated Protoxide of Nickel. Hydrate of Potassa. Chlorine. Hydrated Sesquioxide of Nickel. Chloride of Potassium.

$$\overbrace{2NiO \cdot H_2O} + \overbrace{K_2O \cdot H_2O} + \overbrace{Cl} = \overbrace{Ni_2O_3 \cdot 3H_2O} + \overbrace{2KCl}.$$

This change arises from the action of the chlorine upon the potash, during which chloride of potassium, KCl, is formed, while the nascent oxygen which is liberated from the potash combines with the oxide of nickel. Again, cyanogen, C_2N_2, and chlorine do not enter directly into combination, but if cyanogen at the instant that it is liberated from one of its compounds (as, for example, cyanide of mercury) comes in contact with chlorine, the two combine; and many other examples of similar action might be adduced.

NASEBY, a parish of England, in the county of Northampton, 12 m. e. by n. of Rugby. Pop. under 750. The battle of Naseby, between Charles I. and the parliamentary army under Fairfax and Cromwell, took place here, June 14, 1645. It resulted in the total defeat of the royalists, the king being compelled to flee, after losing his cannon and baggage, and nearly 5,000 of his army as prisoners.

NASH, a co. in n.e. North Carolina, bounded on the n. by Swift creek, on the s.w. by Contentny creek, and drained by Tar river; 548 sq.m.; pop. '90, 20,707, chiefly of American birth, inclu. colored. The surface is irregular and heavily wooded. The principal productions are Indian corn, cotton, sweet-potatoes, wheat, and oats. Co. seat, Nashville.

NASH, Abner, 1716–86; b. Va., brother of Gen. Francis; when very young removed from Prince Edward co. to Newbern, N. C., where he studied law, entered at the bar, and continued a successful practice for many years. He was a member of the provincial congress in August, 1774, and of the council in 1775. In 1776 he was a member of the commission which framed the state constitution of Virginia, and was elected to the house of commons session of 1777–78. In 1779 he was elected president of the senate, and governor of the state in 1780, resigning in the following spring. He married for his first wife the widow of Governor Arthur Dobbs. In 1782 he was again elected to the assembly and was sent by that body as delegate to congress 1782–84 and 1785–86.

NASH, Francis, b. 1720 in Va.; settled in Orange co., N. C.; was clerk of the superior court of the county before the revolution; was a member of the provincial convention of 1775, by which he was appointed lieut.-col.; in 1777 was made brigadier-general by the continental congress; commanded a brigade at Brandywine and Germantown. At the latter place he was mortally wounded, and died at Kalpsville, Penn., Oct. 17, 1777. A monument was erected by the citizens of Germantown and Norristown.

NASH, John, an architect, was b. in London in 1752. He underwent the usual course of training for his profession, but soon entered into some building speculations which enabled him to buy a small property in Caermarthen. Here in fresh speculations he lost much money; therefore, in 1792, returned to London and architecture, in which he speedily rose to eminence. On the strength of having obtained a patent in 1797 for improvements in the construction of the arches and piers of bridges, he was in the habit of claiming a great part of the credit of introducing the use of cast-iron girders. A large part of his time was occupied in designing and constructing mansion-houses for the nobility and gentry in England and Ireland, but he is chiefly celebrated in connection with the great street improvements in London. From Feb., 1815, when he was appointed "architect, valuer, and agent to the board of woods and forests," down till near the end of his professional career, he was busily engaged in the planning of routes, grouping of buildings, and fixing of sites. Regent Street, Haymarket Theater, Langham Place church, and the terraces in Regent's Park are specimens of his designs. The pavilion at Brighton was another of his works. He retired from his profession in 1834, and died May 13, 1835. Nash, notwithstanding his many defects, possessed great power of effective grouping, as is well shown in his works. In the architecture of mansion-houses the designing of "interiors" was his *forte*.

NASH, Joseph, b. in England 1812; began his career as an artist in 1835 by exhibiting drawings of French cathedrals and other ancient buildings. He soon acquired high rank as a painter in water-colors and he made a specialty of illustrating old English architecture and domestic interiors. Nash published two series of these illustrations. *Architecture of the Middle Ages* (1838), and *Mansions of England in the Olden Time* (1839–49). Nash also produced historical paintings in water colors, such as "Charles V. visiting Francis I. during his Confinement;" "Queen Catherine, Campeius, and Ladies" and "The Queen's Visit to Lincoln Hall" (1846). In 1878 an annual pension was bestowed upon him in recognition of his services to art. He d. 1878.

NASH, Richard, better known by the name of *Beau Nash*, a fashionable character of the last century, who attained to a very remarkable notoriety, was the son of a Welsh

gentleman, and was born at Swansea, in Glamorganshire, Oct. 18, 1674. After studying at Oxford, he held for some time a commission in the army, and subsequently took rooms in the Temple, but the dissipations of society had more attraction for him than the pursuits of law. He became a diner-out, a frequenter of good society, and contrived to support himself by gambling. But the grand turning-point in his fortunes was his visit in 1704 to Bath—then a favorite haunt of elegant invalids, and the scene of the gayest intrigues. Nash undertook the management of the public balls, which he conducted with a splendor and decency never before witnessed. In this way he came to acquire an imperial influence in the fashionable society of the place. It appears that he was also distinguished by a species of sentimental benevolence. He played hard and successfully; yet if he heard an individual sighing behind his chair, "Good Heavens! how happy would that money make me," Nash would thrust his own winnings into his hands, with theatrical generosity, and exclaim: "Go, and be happy." His own equipage at this period of his career was sumptuous. He used, we are told, to travel to Tunbridge in a post-chariot and six grays, with outriders, footmen, French-horns, and every other appendage of expensive parade. He is praised for the great care which he took of the morals of the young ladies who attended the Bath balls, always putting them on their guard against needy adventurers—like himself. In his old age, Beau Nash sank into poverty, and often felt the want of that charity which he himself had never refused. He died at Bath, Feb. 3, 1761, at the age of 87.

NASH, Thomas, 1567–1601 ; b. England; took a bachelor's degree at Cambridge, from which he was expelled for lampooning the college authorities. After a long tour on the continent he settled in London, and became a literary free lance. He began his career by some clever satires on the Puritans, whom he ridiculed in his *Pap with a Hatchet, An Almond for a Parrot,* and *A Countercuffe to Martin Junior.* His powers of satire soon made him a favorite with the wits of the day. In 1590 he was associated with Marlow in the composition of *The Tragedy of Queen Dido,* and two years later his comedy, called *Summer's Last Will and Testament,* was produced in the presence of queen Elizabeth. But witty as he was as a pamphleteer, he had little talent as a dramatist; his play fell flat, and, as writing for the stage was then the only remunerative field for an author, he was soon miserably poor. In his *Pierce Penilesse, his Supplication to the Divell,* he describes himself as "sitting up late and rising early, contending with the cold, and conversing with scarcitie;" and the same tone prevails in his *Christe's Tears over Jerusalem.* He soon plucked up his old spirits, however, and began to assail Gabriel Harvey, a friend of Spenser and sir Philip Sidney, but an object of constant ridicule by the town wits. Harvey defended himself, but in vain, against the shower of pamphlets which Nash rained upon him. In 1597 Nash produced a satirical play called *The Isle of Dogs.* His satire seems to have been too pungent, for he was arrested and imprisoned in the Fleet. No later work of his is known.

NASH, William, d.d., b. in Stuttgart, Germany, 1807; educated at the university of Tübingen. Removing to the United States, he became a minister of the Methodist Episcopal church at the west, and founded American German Methodism. He published a German commentary on the Bible, and for several years has edited the German publications of the Methodist Episcopal church.

NASHUA, city and one of the co. seats of Hillsboro co., N. H.; on the Nashua river, near its junction with the Merrimac; 35 m. s. of Concord and 40 m. n.w. of Boston. It was settled before 1673; was called Dunstable till 1836; and became a city in 1853. Among railroads passing through Nashua are the Boston and Maine, and its Boston and Lowell, Concord, Nashua and Rochester, and Worcester and Nashua branches. The city has a public library, a Protestant home for aged women, churches, public and parochial schools, national and savings banks, and several newspapers. A canal 3 m. long, 60 ft. wide, and 8 ft. deep connects the rivers and furnishes water-power. The manufactures include iron and steel, edge tools, locks, bobbins and shuttles, furniture, cotton goods, carpets, cards and glazed paper. A large reservoir n. of the city receives water from Pemichuck brook, 2 m. distant, and there are electric light and electric street railroad plants. Pop. 1890, 19,311.

NASHVILLE, city, port of delivery, capital of Tennessee, and co. seat of Davidson co.; on the Cumberland river and the Louisville and Nashville and the Nashville, Chattanooga, and St. Louis railroads; 233 miles e.n.e. of Memphis. It was settled in 1780; was incorporated as a town in 1784, chartered as a city in 1806, and rechartered in 1888; was the seat of the legislature in 1812–15 and 1826–43; and became the permanent state capital in the latter year. In 1862 it was occupied by a union army, and in 1864 was the scene of a desperate battle (see Nashville, Battle of). The city is built on gradually rising ground, reaching an elevation of 460 feet above sea-level, and is regularly laid out. It has excellent drainage; waterworks plant owned by the city, with two mammoth reservoirs and engines at the pumping station with combined capacity of 30,000,000 gallons daily; gas and electric light plants; and an extensive electric street railroad system. Among the noteworthy buildings and institutions of the city are the capitol, an imposing building of limestone and iron that cost nearly $1,500,000; county court-house; State school for the blind; city hospital; Howard library; State library; Tennessee historical society; Tennessee confederate memorial and historical society; engineering association of the Southwest; U. S. government building of lime-

stone and granite (cost nearly $1,000,000); state penitentiary; and the residence and tomb of President Polk. About 6 miles distant is the State hospital for the insane, and about 10 miles e. is the Hermitage, the residence of Andrew Jackson. The city is widely noted for its educational institutions, which include Vanderbilt university (Meth. Epis. S.), the university of Nashville, Fisk university for colored students (Cong.), Roger Williams university for colored students (Bapt.), Central Tennessee college for colored students (Meth. Epis.), St. Bernard's and St. Cecilia's academies and St. Joseph's school (all Rom. Cath.), Nashville college for young ladies (Meth. Epis. S.), Ward seminary (Pres.), Belmont college, Southern Christian college, Peabody normal college, Wharton academy, Bell academy, University school, East Side academy, Boscobel female college, Price college for young ladies, Meharry medical department for colored students, and the Nashville military school. The city is also noted for the large number of churches it contains. The U. S. census of 1890 reported in Nashville 420 manufacturing establishments, which had a combined capital of $9,904,295, employed 8,122 persons, paid $3,728,956 for wages and $7,994,751 for materials, and had an output valued at $14,590,823. The various kinds of lumber mills had a capital of over $1,500,000, and an output valued at over $2,215,000, and the foundries and machine shops had a capital and output of about $800,000 respectively. There are also large cotton mills, saddlery and harness factories, brick and tile works, flour and grist mills, railroad car and repair shops, wire rope and cable works, tobacco factories, woolen mill, artificial ice plants, etc. The city has an extensive trade with a large section of country, and has become an important distributing point by rail and water of manufactures, agricultural products, and general commodities. The centennial of the admission of Tennessee into the union was celebrated at Nashville, June 1, 1896, and the event was further commemorated by a grand exposition opened May 1, 1897, President McKinley pressing a button in the White House which started the machinery at the exposition. The buildings included the Parthenon, for the fine arts; Commerce; Minerals and Forestry; Transportation; Agricultural; Auditorium; Woman's; Administration; and one for the exhibits of the U. S. government. Congress aided the exposition liberally. Pop. '90, 76,168.

NASHVILLE, Battle of. After the battle of Franklin, Nov. 30, 1864, between Hood and Schofield, the latter withdrew to Nashville, which he reached the next day, taking up his position on the heights about the city. Before Hood had established his lines s. of Nashville on the 4th, Thomas had been re-enforced by Morgan's division from Chattanooga, by Steedman's command of 5,000 men, by A. J. Smith's from Missouri, and by additional recruits, so as to be about equal to Hood's except in cavalry. The greater part of the cavalry force of Thomas had gone with Sherman. A storm on the night of Dec. 8, prevented operations for nearly a week. On the night of the 14th a plan of operations was agreed upon and was successfully carried out the next day, in spite of a dense fog in the morning. Hood was driven back of his line of works, to a position at the foot of Harpeth Hills. His loss in killed and wounded was heavy; and some 1200 prisoners and 16 pieces of artillery were taken from him. The federal loss was much less. On the morning of the 16th the battle was renewed, and by evening the confederate army was in retreat, having lost in the 2 days' fighting, 4,462 prisoners and 53 pieces of artillery. The federal army followed up the pursuit till the 27th, when the remainder of Hood's army crossed the Tennessee. The main federal army then gave up the pursuit, which was, however, continued by a cavalry force under Palmer, which caught up with the retreating army and destroyed a large amount of property. The loss of Thomas was estimated at about 10,000, during the entire campaign, from Sept. 7, 1864, to Jan. 20, 1865. In the same time 13,189 prisoners and 72 pieces of artillery were captured from the confederates. Hood was relieved from command Jan. 23, 1865.

NASIELSK, a village in the government of Lomza, Russia, on the Nasielka river and the railroad between Kovel and Mlaba. It is known for a battle between the French and the Russians which was fought here on December 24th, 1806. Pop. '90, 4847.

NASIK. See Nassick.

NA'SMYTH, James; b. Edinburgh 1808; son of Alexander, the landscape painter. By the sale of models of steam engines and other machinery he was able to pay his fees at Edinburgh university, where he studied mathematics, natural philosophy, and chemistry. In 1829 he became assistant to the celebrated London engineer, Henry Maudslay, and in 1834, he began the manufacture of mechanical tools at Manchester, on his own account. The capacity of his Manchester works soon grew too small for the demands of his business, and he built a series of great workshops, called the Bridgewater foundry, near Manchester. Among the mechanical tools which he invented are the steam-hammer, the steam pile-driver, the suction-fan for ventilating mines, the safety foundry ladle, for pouring castings with safety to the workman, a spherical seated safety-valve, and a reversible rolling mill which does away with the necessity of a fly-wheel. He retired from business in 1857, and subsequently was engaged in researches into the structure of the sun and moon, with telescopes of his own manufacture. He published *Remarks on Tools and Machinery*, 1858; in association with James Carpenter, *The Moon Considered as a Planet, a World, and a Satellite;* and an autobiography. He d. 1890 in London.

NASON, Elias; b. Mass. 1811; graduated at Brown University in 1835; devoted himself to music, botany, and the languages; was a teacher and editor in Georgia, and

in 1840–49 an instructor in Newburyport, Mass.; became pastor of Congregational churches in Massachusetts and New Hampshire. He published *Lives* of sir C. H. Frankland, Susanna Rowson, Nathaniel Howe, Charles Sumner, and Henry Wilson; a *Gazetteer of Massachusetts*, and a *History of Middlesex County*. He d. in 1887.

NASR-ED-DIN, b. Persia, 1829. On the death of his father, Muhammed Mirza, Sept. 10, 1848, he ascended the throne of Persia. His reign was principally distinguished by his successful contests with the neighboring tribes, his suppression of the sect of the Babis, who revolted and attempted his life in 1852, his defeat in the war with England in 1856–57, the famine which desolated a large part of his country in 1871, and his visit to the principal courts of Europe in 1873, which he described in a curious diary, translated into English by J. W. Redhouse. The concessions which he made to baron Reuter for establishing railroads and canals, and working the mines in Persia, ended in no practical results. He d. in 1896. He had three sons and eight daughters, the heir being Muzafer-ed-din, who succeeded him.

NASSAU, an island in the Pacific Ocean, lying in lat. 11° 35′ s., long. 166° 15′ w. It is low and uninhabited, was discovered in 1835 by a captain of an American whaling ship but has since been annexed by Britain.

NASSAU, formerly a German duchy, forming since 1866, together with Frankfort-on-the-Main, the circle of Bieden-Kopf and the former county of Hesse-Homburg the Prussian government of Wiesbaden in the province of Hesse-Nassau. Area, 1802 sq. miles. Pop. '90, 843,209. Wiesbaden possesses very great physical advantages. In its southern districts, nearly the whole of its area is occupied by the Taunus mountains, whose highest point, the great Feldberg, attains an elevation of about 2,750 feet. This range includes within its boundaries the fertile valleys known as the Rheingau. The northern part of the district includes the barren highlands of the Westerwald, whose most considerable peak, the Salzburger Head, is nearly 2,000 ft. high. Besides the Rhine and the Main, which are the boundary-rivers, Wiesbaden is traversed from e. to w. by the Lahn, which becomes navigable at Weilburg, and is augmented by the confluence of numerous other streams, as the Weil, Embs, Aar, Dill, and Elbe. The productiveness of the soil is proved by the excellent quality of the numerous vegetable products, which include corn, hemp, flax, tobacco, vegetables, and fruits, including grapes, which yield some of the most highly esteemed Rhenish wines. The hills are well wooded, and abound with game of various kinds, and the rivers yield an abundance of fish and crustaceans. In the more mountainous districts, iron, lead, copper, and some silver are obtained, together with good building stone, marble, and coal; the chief mineral wealth is, however, derived from the numerous springs, which, directly and indirectly, bring the government a large annual gain. The most noted of these springs, of which there are more than 100, are Weilbach, Langen-Schwalbach, Schlangenbad, Ems, Selters, and Geilnau, the majority of which were the property of the duke. The hot springs of Wiesbaden were known to the Romans under the names of *Fontes Mattiaci* and *Aquae Mattiacae*.

Wiesbaden, which is divided into 12 circles, has few towns of any commercial importance, but it boasts of many fashionable watering-places, which are annually crowded with visitors from every part of the world. Of these, the most considerable are Wiesbaden (q. v.), the capital of the district—pop. Dec. '95, 74,122—Schwalbach, Schlangenbad, Fachingen, Selters, and Geilnau. Höchst, an active little place on the Main, is the only manufacturing town of the duchy, but a brisk trade is carried on at many small ports on the Rhine, Main, and Lahn, from whence the mineral waters, wines, and other natural products of the country are exported. The exports are wine—including some of the choicest kinds, as Hochheimer, Johannisberger, Rüdesheimer, Markobrunner, Asmannshäuser—mineral waters, corn, iron, manganese, cattle, etc.; while the imports embrace colonial products, manufactured goods, salt, jewelry, etc.

Nassau had a representative form of government, based on the constitution of 1814; and the duke, who was also a count-palatine of the Rhine, count of Sayn, Königstein, Katzenellenbogen, and Dietz, etc., was assisted in the government by a council of state, presided over by a prime-minister. The legislative assembly consisted of an upper chamber composed of 24 representatives, chosen for six years, and a second chamber, chosen annually. More than one-third of the population belonged to the Catholic church, which was under the ecclesiastical jurisdiction of the bishop of Limburg, who was assisted by a board of commissioners, located at Eltville, on the Rhine; and excepting about 19,000 persons who belonged to the Jewish and other persuasions, the remainder of the people, including the then reigning house, professed the "evangelical" form of German Protestantism, and were comprehended in one episcopal see under the bishop of Wiesbaden. Ample provisions were made in the district for popular education, in furtherance of which there were upwards of 700 elementary schools, with about 1000 teachers, 10 normal schools, a gymnasium, various training, theological, polytechnic, military, and other educational institutions. In accordance with a treaty with Hanover, Göttingen constitutes the university for arts for Wiesbaden, which has also a Roman Catholic theological faculty in conjunction with Hesse-Cassel at the university of Marburg. Wiesbaden, which is the principal seat for all national institutions of literature, science, and benevolence, has a good public library, containing 100,000 volumes, a museum, etc.

Nassau occupied, in conjunction with Brunswick, the thirteenth place in the limited council of the diet, but it had two votes in the *plenum*, or full council. It furnished a contingent of 4,279, with a reserve of 1833 men, to the army of the old confederation.

The receipts, according to the budget of 1866, were 4,461,410 florins derived from the crown domains and indirect taxes, and 317,935 florins from direct taxation, while the expenditure was estimated at 5,804,975 florins. The national debt at the close of 1864 represented a capital of 6,038,300 florins. The duke, who was in possession of very extensive domains, ranked as one of the richest princes of Germany.

In tracing the history of Nassau to its earliest origin, we find that the districts now known by that name were anciently occupied by the Alemanni, and on the subjugation of the latter people by the Franks, became incorporated first with the Frankish, and next with the German empire. Among the various chiefs who raised themselves to independent power in this portion of the Frankish territories, one of the most influential was Otto of Laurenburg, brother of king Conrad I., who became the founder of two distinct lines of princes. The heads of these lines were Walram and Otto, the sons of count Henry I., who, in 1255, divided the land between them. Walram II., the elder, was the progenitor of the house of Laurenburg, which, towards the close of the 12th c., assumed its present name of Nassau from the name of its chief stronghold; while Otto, the younger, by his marriage with the heiress of Gelders, founded the line of Nassau-Gelders, whose last male representative died in 1423, but which still survives through a female branch, in the family now occupying the throne of the Netherlands. This junior branch of the house of Nassau, by inheritance from a collateral representative, acquired possession, in 1544, of the principality of Orange; and since that period the representatives of the Otto line have been known as princes of Orange (q.v.). The Walram line, which in 1292 gave an emperor to Germany, in the person of Adolf of Nassau, was subdivided by the descendants of that prince into several branches, until, by the successive extinction of the other lines, the Nassau-Weilburg family, which at present reigns over the duchy, was left, in 1816, the sole heir and representative of the Walram dynasty in Germany. Nassau had been declared a duchy in 1806, and in 1817 the reigning duke William granted a new constitution; but during the first sittings of the assembly, dissensions arose between the ducal government and the representatives, the former having attempted to establish the proposition that the ducal domains were the unconditional property of the royal house, and that all the expenses of the state would consequently have to be met by taxation.

This proved a fruitful source of dissension between the duke and his people, and the opposition and discontent to which it gave rise were not finally allayed till 1834, when a more liberal ministry under count Walderdorff, succeeded the unpopular cabinet which had hitherto directed public affairs. Concessions were made by the ducal government, which met the requirements of the chambers, and a satisfactory compromise was effected in regard to the crown revenues. In 1836 Nassau joined the German *Zoll-Verein*, and subsequently to that period it has continued to advance in material prosperity. The reigning duke, Adolphus William, who succeeded his father, Duke William, in 1839, showed the same conservative tendencies as his predecessor. The revolutionary crisis of 1848 found the people, who had been harassed by over-government and by a jealous dread of liberal sentiments, ripe for insurrection. The peasantry rose *en masse* in the rural districts, and revenged themselves for the severity of the game-laws and other obnoxious restrictions by perpetrating the most wanton destruction of game and wood in the forests belonging to the crown and nobility. These disorders were speedily put down by the aid of federal troops, but, notwithstanding the concessions made by the government, the relations between the people and their ruler continued for many years to be unsatisfactory. For the events which led to the incorporation of Nassau with Prussia, see GERMANY.

NASSAU, a co. in n.e. Florida, bounded e. by the Atlantic, n. and n.w. by Georgia, from which it is separated by St. Mary's river; drained also by the Nassau river, its s. boundary: traversed by the Florida Central and Peninsular railroads; about 640 sq. m.; pop. '90, 8294, includ. colored. Amelia island is included in the county. The surface is level, and the soil toward the coast, sandy; rice, sweet potatoes, Indian corn, and molasses are the chief products. Co. seat, Fernandina.

NASSAU, the capital of New Providence, is the center of the trade of the Bahamas (q.v.). It is pleasantly situated on the face of a hill, in lat. 25° 6′ n., long. 77° 22′ w. and is the capital of the chief island of New Providence, whose pop. is 11,000. The town is well laid out; has several handsome public buildings, and an excellent and well-sheltered harbor. The climate is very salubrious, and Nassau is a great resort of invalids from the north, and has extensive hotel accommodation. Nassau exports cotton, pimento, and salt. During the civil war in the United States, it became notorious in connection with the blockade-runners.

NASSAU HALL. See NEW JERSEY, COLLEGE OF.

NASSICK′, or NASIK, a t. of British India, in the district of the same name, in the presidency of Bombay, 95 m. n.e. of Bombay, spreading over three small hills. It is a town of great sacredness in the estimation of the Hindus—more revered than even

Benares—is a great place of pilgrimage, the chief seat of Brahmanism in the Deccan, and the residence of many families of Brahmans, some of them living in great affluence. It contains many temples, which are built along both banks of the Godavery, and on rocks in the river. They are all of black basalt, and dedicated to Siva. Of far greater interest, however, are the Buddhist caves, about 5 m. from the town, which are situated in a conical hill, at a height of about 100 yards from its base. They are rudely executed. The figures which they contain are in a state of good preservation, and the leading figures are those of Buddha; but the whole character of the remains is thought to indicate Buddhism in a state of transition or compromise with Brahmanism. Nassick ranks first in copper and brass work among the towns of the Bombay presidency. Nassick contained in 1891 a resident population of 24,400, of whom 20,700 were Hindus.

NAST, Thomas, b. Bavaria, 1840. His parents emigrated to America in 1846, and when only 14 years of age he was employed as a draughtsman on *Frank Leslie's Illustrated Newspaper*. Without having received any regular instruction in drawing, he furnished acceptable sketches for the engravers. He went to England in 1860 to illustrate the Heenan and Sayers prize-fight for the *New York Illustrated News*. He then traveled to Italy to follow Garibaldi, and made sketches of the war which appeared in the *New York Illustrated News*, the *Illustrated London News*, and *Le Monde Illustré*. Returning to America he formed a connection with *Harper's Weekly*, which was continued with success for many years. His contributions to that journal were mostly political cartoons, in which he effectively caricatured and satirized the blunders of public men, and illustrated the leading topics of the day. He has appeared as a lecturer in many cities of the United States, illustrating his lectures by caricatures drawn on the platform. He started the publication of *Nast's Illustrated Almanac* in 1872, and has illustrated *The Tribute Book*, Nasby's *Swinging 'round the Cerkle*, and other works. He also illustrated the *Pickwick Papers* and *Pictures from Italy* in Harper's household edition of Charles Dickens's works. Although a clever painter in oil and water-colors, he confines himself mainly to drawing upon wood. His quickness of conception and facility of execution are remarkable. In 1894 he was called to *The Pall Mall Magazine*, London.

NASTURTIUM. See Cress and Tropæolum.

NATAL. The region now forming the colony of Natal derives its name from its being discovered by the Portuguese on Christmas day 1497. It was visited about 1822 by several white traders from the Cape, who found the country in possession of the Zulu chief Chaka, who ruled in a most sanguinary manner over all the tribes from the Umzimculu to the St. Lucia river. He was killed and succeeded by his brother Dingaan in 1838, but the latter having treacherously murdered a party of emigrant Dutch Boers, who had paid him a friendly visit by invitation to buy land, he was attacked and finally destroyed by the Boers, who at that time had emigrated from the Cape Colony in large numbers, and who made his brother Panda paramount chief in his stead, and then settled themselves down in the country as his lords and masters. The British government, however, now interfered, and, after a severe struggle on the part of the Boers, the country was formally proclaimed a British colony on May 12, 1843, since which time it has progressed very satisfactorily. In 1856 it was erected into a distinct and seperate colony, free from the control of the governor of the Cape. In 1873 Langalibalele, a chieftain of Zulus within the n. frontier, was on suspicion treated very summarily by the colonial government, and banished. The English government decided that the proceedings were illegal, and sir Garnet Wolseley was sent as temporary governor. It was mainly because the security of Natal was menaced by the warlike forces and equipments of Cetewayo, nephew of Dingaan, king of the free Zulus, that the Zulu war of 1879 broke out. Zululand was invaded by the British, and after a fierce defense was finally parceled out amongst various chieftains, nominally independent, but under the supervision of British residents. A part of the colonists sympathized with Dr. Jameson's raid into the Transvaal and made this feeling apparent when, with his officers, he passed through the colony on his way to England, but the governor spoke in condemnation of the raid, urging a policy of prudence and peace in South African affairs.

The colony of Natal is on the s.e. coast of Africa, about 800 m. e.n.e. of the cape of Good Hope, between the 29th and 31st parallels of south latitude. Its n.e. boundary is the Tugela or Buffalo river, which divides it from Zululand, and its s.w. boundary is the Umzimculu and Umtamouna rivers, separating it from Kaffraria proper. A lofty and rugged range of mountains called the Quathlamba, or Drachenberg, divides it from the Free State and Basutoland. The area is estimated at about 20,461 sq. miles, with a population in 1891 of 543,913, divided into Kaffirs, the most numerous element; Indian coolies; and Europeans, the last-named numbering 46,788, more than double the numerical strength of that element in 1879. The white population consists of Dutch Boers who remained in the country after it became a British colony and of English and German settlers. The Indian coolies are largely employed as workmen on the plantations and as house servants. The Kaffirs are chiefly engaged in cattle raising, but to some extent also in agricultural pursuits. The chief port is Durban or Port Natal, the capital of the county of the same name. It is situated on the bay of Natal and is an important railway station. It has a light-house, botanical garden and extensive warehouses, with a population estimated in 1894 at 27,984. The harbor, which is said to be the best between Delagoa bay and Table bay, is landlocked and therefore secure, but inaccessible to vessels above a certain tonnage on account of the shallow water over the bar. Impor-

tant engineering works, however, for removing this obstruction have been undertaken. There is secure holding ground in the outer anchorage. The capital of Natal is Pietermaritzburg, with a population in 1891 of 17,500. It is situated on a tributary of Umgani river, about 50 miles inland. It possesses a large military establishment and many substantial public buildings. Its name is a compound of the Christian name of Pieter Rietief and the surname of Gert Maritz, two celebrated leaders of the emigrant Boers, who were murdered by Dingaan. Other important towns are Richmond, Newcastle, Verulam, Isipingo, and Ladysmith.

The mountains on the borders are composed of a confused mass of granite, gneiss, sandstone, basaltic veins, and shale, and present both the flat top and serrated summits of the chain, of which they are a continuation, so well known in the Cape Colony as the Sneeuwberg and Stormbergen. About lat. 28° 30′ these mountains seem to reach their culminating point, and probably attain a height of 10,000 ft., forming a summit line of watershed, from which flow to all points of the compass the waters of the Orange, Umzimvoobo, Vaal, Tugela, and other large South African streams. Towards the coast these mountains present a scarped and almost inaccessible face; towards the interior, however, they gradually die away into the immense rolling plains of the Free State. Many offshoots from these mountains traverse the colony, dividing it into a series of steps or plateaux, gradually rising from the coast region to the foot of the mountains, and forming so many zones of natural productions.

The coast region, extending about 25 m. inland, is highly fertile, and has a climate almost tropical, though perfectly healthy. Sugar, coffee, indigo, arrowroot, ginger, tobacco, and cotton thrive amazingly, and the pine-apple ripens in the open air with very little cultivation. The midland terrace is more fit for the cereals and usual European crops; while on the higher plateau, along the foot of the mountains, are immense tracts of the finest pasturage for cattle and sheep.

The climate is very salubrious; the thermometer ranges between 90° and 38°, but the heat, even in summer, is seldom oppressive. The mean annual temperature at Pietermaritzburg, the capital, is 64° 71′. The winter begins in April and ends in September; the average number of rainy days being 13. In the summer season the thunder-storms are very frequent and severe. The annual rainfall on the coast is about 35 inches. Inland it varies a good deal in different districts, and is greatest in summer. The south-east is the prevailing wind here in the summer months, as in the Cape Colony. Occasionally the sirocco or hot wind from the north-west is felt, which generally terminates in a thunder-storm.

The large animals are gradually disappearing, although elephants are still occasionally met with in the dense bush of the coast region. Lions, leopards, wolves, and hyenas still hang on the outskirts of civilization. The smaller antelopes are plentiful, and alligators are met with in nearly all the rivers north-east of the Umzimculu. Natal, besides several poisonous snakes, produces a small species of boa, which sometimes attains a length of 16 feet. The hippopotamus is still found near the mouths of the rivers on the eastern frontier.

The botany of this region resembles that of Kaffraria proper, although generally of a more tropical character. All the timber-trees of the Cape Colony are found here, besides many new ones. The climate of the coast region, however, is too warm for the grape, at least for the purpose of wine-making.

Natal received a charter in 1856 which was modified in 1875 and 1879. It is now governed by a charter granted in 1893. The executive authority is in the hands of a governor appointed by the British sovereign. To a certain extent he possesses legislative authority also, for his assent to bills is required before they can become laws. He is assisted by five ministers, namely the colonial secretary and minister of education, who is premier; the attorney-general; the colonial treasurer; the minister of native affairs, and the minister of land and works. With the advice of his ministers he appoints the members of a legislative council. There is also a legislative assembly having, in 1896, 37 members, holding annual sessions, and possessing the sole right of originating money bills upon the recommendation of the governor. The members of this body hold office for 10 years. The legislative council has the right of rejecting or accepting, but not of altering, the revenue measures passed by the legislative assembly. The governor convenes the legislative assembly and has the right to prorogue or dissolve it. There is a property qualification required for suffrage and the electors of 1895 numbered only 9,483. Municipal institutions have been granted to the principal towns. For administrative purposes the colony is divided into 26 magisterial districts.

The Anglican, Scottish, Dutch and other churches exist, and there are stations of Wesleyan, American, Norwegian and Berlin missions. Since 1877 great attention has been given to education, and the government has applied large sums for this purpose. It was stated in 1896 that nearly 96% of the total number of white children were being educated. In that year, besides a large number of private schools, there were 227 so-called farmhouse schools which received government aid; 46 other schools supported in part from the public funds; 13 government primary schools; and several art schools, and high schools under the control of the government. There were also over 130 schools for the natives and a considerable number for the children of Indians.

The railway system has been greatly extended in recent years. In 1896 there were 402 miles of railway open for traffic. The main line runs from Durban to Pietermaritzburg and from the latter place to Johannesburg and Pretoria. Branch lines connect Durban with Verulam, and South Coast Junction with Isipingo; and a line runs to Harrismith in Orange Free State. The roads are all built and are worked by the government.

The principal articles of export from Natal are wool, gold, sugar, hides, coal, Angora hair, bark, and spirits. A large part of the exports of the colony consist of re-exports, and when this amount is deducted, wool comprises about one-half of the remainder. The gold export is large because much of the gold from the South African states passes through Natal. The exports in 1895 amounted to $6,351,025, a falling off since 1893. By far the greater portion of the exports go to Great Britain and the British possessions. As to the imports, an even larger proportion are derived from Great Britain and her colonies. The figures for 1895 were $11,907,145, also a falling off since 1893. The leading items in the list of imports were iron and iron goods, such as hardware, cutlery, etc., haberdashery and millinery, apparel, leather manufactures, machinery and railway plant, woolens, cottons, flour, coffee, spirits, wines, and ales. The commerce of the country has greatly advanced since 1843, when the value of the imports was only £11,712, and of the exports £1261. As early as 1862 the productions of Natal made a very good showing at the great exhibition.

The revenue of the country in 1843 was only £12,000, while in 1894–5 it was £1,169,780 and the expenditure in the same year was $1,148,093. The principal sources of revenue are the railways, customs, mails, land sales, stamps, licenses, the excise, telegraphs, and the tax on native huts. The chief object of expenditure during the year ending June 30, 1895, was the construction and maintenance of railways and public works. The public debt in 1895 was £8,054,343.

The chief occupations are agriculture, the raising of sugar-cane and various food and vegetable crops, and cattle. A large part of the area of the colony has been obtained by Europeans by grants from the crown, which in 1893 still retained about one million acres of land as yet unsold. About $2\frac{1}{4}$ million acres of the colony have been set apart for the natives. A very small portion of the land acquired by the Europeans is actually under cultivation. Of this a considerable acreage is given up to the cultivation of the sugar-cane, sugar being one of the chief articles of export. Tea-planting has been recently introduced, and in 1895 the production was considerable. More important is the rearing of live stock, including cattle, sheep, horses, and Angora goats. The mineral wealth of the colony is reported to be great, but it has not been developed. The coal fields, however, having been brought into direct communication with the seaport of Durban, have been turned to advantage, and in 1895 yielded upwards of 160,000 tons.

There is no army in the proper sense of the word, but there is a considerable body of mounted police. These numbered 259 Europeans in 1896. There is also a corps of volunteers numbering 1531, and a volunteer naval defence corps.

NATAL, or Rio Grande do Norte, a town and seaport of Brazil, 160 m. n. of Pernambuco, capital of the province of Rio Grande do Norte, and having a harbor with an area of 2 sq. m. and of good anchorage. Pop. (comm.), 6,000.

NATALIE, Queen of Servia, b. in 1859, the daughter of a wealthy Russian officer named Keschko. In 1875 she married Prince Milan, afterward king of Servia, but their married life was unhappy and in 1888 Milan procured a divorce. The Queen protested against the divorce as illegal and it was afterwards so pronounced by the Holy Synod. After King Milan's abdication in 1889, she returned to Belgrade and remained for some time with her son King Alexander, but the national assembly having requested her to leave the country in the interest of internal harmony, she withdrew in 1891. In 1893 she became reconciled to King Milan.

NA'TANT. See Naiant.

NATATO'RES (Lat. swimmers), the name given by Illiger and many other ornithologists to the order of birds called *palmipedes* (q.v.) by Cuvier.

NATCHEZ, a tribe of Indians who formerly occupied the country including the site of the present city of Natchez, and who, when discovered by the Spaniards in the latter part of the 16th c., possessed a civilization far in advance of other tribes in their neighborhood, and in some particulars exhibiting the characteristics of the Aztecs. They were sun-worshipers, and preserved the custom of maintaining a sacred fire in their temples perpetually burning. Their ancestry was mythical, but they were ascribed to the Huaxteco-Maya family. They were brave, but possessed many vices; and although they established and sustained friendly relations with the French, which were seldom interrupted, they were in 1729 guilty of an act of treachery towards the latter, in organizing their wholesale massacre on account of some fancied harshness of treatment at the hands of the French commander, which brought about a general war. The French, with the assistance of the Choctaws, attacked and destroyed a large portion of the tribe, and sold as many as 400 into slavery, driving the remainder over the Texas border. The remnant of the Natchez, about 300 in number, at present live in company with the

Chickasaws and Muskogees, and continue to retain their ancient form of organization and certain of their customs and rites.

NATCHEZ, city and co. seat of Adams co., Miss.; on the Mississippi river and the New Orleans and Northwestern, and the Yazoo and Mississippi Valley railroads; 100 miles s.w. of Jackson, 300 miles n. of New Orleans. It is built on a bluff, 200 feet above the river, the summit of which contains the most costly residences, and the base, or water front, the principal shipping and business houses. The city has a memorial park and three other public parks on the bluffs, a state hospital, Fisk library, Stanton college, Natchez institute, U. S. marine hospital, Roman Catholic cathedral, several banks, electric lights, street railroads, water supply from driven wells, and several churches. There are cotton mills, cotton compress, cotton oil mills, foundry, saw and planing mills, artificial ice plant, etc. It is the shipping port of a large cotton region, exports annually many thousands of bales, and has steamboat connections with the whole Mississippi valley. Natchez derives its name from a noted tribe of Indians, and has a historical record full of vicissitudes. Its site was chosen by the French in 1700 as the chief place of a number of proposed settlements in the lower Mississippi territory; was settled about 1713, and was a French military and trading post 63 years, when it passed into the hands of the British. Next, it was occupied by the Spaniards; then by treaty in 1798 it came into the possession of the United States, and became the capital of the state. Seventeen years later the seat of government was removed to Jackson. It was destroyed by the Indians in 1729, has been laid in ruin once by a tornado, and was captured during the civil war by Farragut. It was formerly the residence of many wealthy planters, and is still a typical southern city, with broad, handsomely laid-out streets, and residences adorned with large gardens. A national cemetery is situated on a bluff adjoining the city. Pop. '90, 10,101.

NATCHITO'CHES, a tribe of Indians of the Huaxteco-maya family, presenting the same characteristics as the Natchez, and who formerly inhabited lands along the Red River in Louisiana. Here, on an island, they possessed a fortified town, which they were forced by the Natchez to evacuate, when the latter were expelled by the French from their own territory in 1731 and forced to flee into Texas. The Natchitoches united with the Caddoes, with whom the few of them who still exist continue to live.

NATCHITO'CHES, a parish in n.w. Louisiana, bounded on the e. by Saline bayou, and drained by Red river; 1285 sq. m.; pop. '90, 25,836, chiefly of American birth, includ. colored. The surface is mostly level and heavily wooded, and there are several lakes. The soil, especially in the river bottoms, is fertile. The principal productions are Indian corn, cotton, and sweet potatoes. Other staples are cattle and wool. Intersected by the Natchitoches and Red River Valley railroad. Co. seat, Natchitoches.

NATIC'IDÆ, a family of gasteropod mollusks, of the section *branchifera*, order *prosobranchiata*, sub-section *holostomata*. See INVERTEBRATE ANIMALS. This sub-section also includes the periwinkles, river-snails, top-shells, ear-shells, tooth-shells, and limpets. In *naticidæ* the shell is globular, of few whorls, small spire, outer lip acute; foot very large; mantle lobes hiding more or less of the shell. The most important fossil genus is *natica*, in which the shell is thick, smooth, and polished, often with colored markings. Fossil naticæ have been found in upper Silurian, Devonian, carboniferous, and Permian formations, and they are abundant in the triassic, Jurassic, cretaceous, and tertiary. The family is extensive, and is distributed throughout all seas. The following genera are now recognized: *natica, surinatia, neverita, polinices, mammilla, cernina, amaura, amauropsis, naticina*, and *sigaretus*, most of the species belonging to these genera being found on the American coasts. They are carnivorous, feeding upon other mollusks, and also upon dead fish. The teeth, situated upon the lingual ribbon, enable them to perforate shells. Some of them make a peculiar nest in the sand, in the shape of a bowl, in which the eggs with their embryo shells are contained, each in a small cell; and they were formerly mistaken for corals.

NATICK, a town in Middlesex co., Mass.; on the Boston and Albany railroad; 17 miles w. of Boston. It contains the villages of Natick Centre, North Natick, South Natick, West Port, North Port, and Felchville, and was incorporated in 1679. It contains a public park, several commons, one having a soldiers' monument, another a monument in memory of John Eliot, the head of Cochituate lake, one of the sources of Boston's water supply, several ponds used for pleasure and water-power, a stretch of the Charles river, the Morse institute (public library and reading rooms), Bacon public library, library and museum of the historical and natural history society, high school, national, savings, and co-operative banks, and gas and electric light plants. The principal industries are the manufacture of boots, shoes, and shirts. The city was for several years the residence of Henry Wilson. John Eliot brought the settlement of "praying Indians" from Nonantum to Natick in 1651, and established a church there in 1660. Pop. '90, 9,118.

NATION (Lat. *natio*, from *natus*, born), a word used in two distinct senses. 1. A state or independent society united by common political institutions; 2. An aggregate mass of persons connected by ties of blood and lineage, and sometimes of language.

The modern dogma of nationalism, as maintained by a class of continental politicians, starts from an assumption that a nation in the latter sense ought necessarily to be also a nation in the former, and endeavors to assign limits to the several races of Europe, with the view of erecting each into a distinct state, separated from other states or nationalities. The extreme politicions of the national school seem to consider the supposed rights of nationalities as paramount even to the obligations of treaties, and the political conjunction of one nationality with another is looked on by them as an adequate ground for a revolt or separation, apart altogether from the question whether the nationality is well or ill governed. In point of fact, the different races in Europe are so commingled, that any reconstruction of the political map of Europe, on ethnological principles, would be impossible, even if desirable. The blood of nine-tenths of Europe has been mixed within the historical period. The test of language, on which nationality has sometimes been based, is a deceptive one, in so far as it is indefinite and perpetually fluctuating. The people on the frontier between two races, as in the south Tyrol, generally speak two languages. Then we have dialects, like the Walloon, the Grödnerisch of the Tyrol, and the Romansch of the Grisons—as also the Breton, Welsh, Gaelic and Irish languages, which could hardly be made the basis of independent communities. The well-being of the people governed is properly the end of all government, and it has practically not been always found that a state is better governed when it consists of one race only, than when it includes an aggregate of races. Highly diversified nationalities may be united in one political system, provided only that the government respects and consults the peculiarities of the several races and does not attempt to force the usages, habits, or language of one on the rest. See Ethnology.

NATIONAL CONVENTION, an assembly of deputies of the people, which assumed the whole government of France on the overthrow of the throne in 1792. When the national assembly (see Assembly, National) had decreed the suspension of the king, Aug. 10th, 1792, it appointed the election of the national convention, which commenced its sittings Sept. 31st. Its first act was to declare France a republic, Sept. 25th. Upon this followed the trial and condemnation of the king. Through the support of excited mobs, the extreme Jacobin party became predominant in the convention; where, from the elevated seats on which its members sat, it received the name of the *mountain* party. The *revolutionary tribunal* was established; the chief administration of affairs was intrusted to the *committee of public safety*, which exercised the most despotic powers. The Girondists (q.v.), at first a powerful party in the convention, were destroyed, many of them perishing by the guillotine; and a new constitution, thoroughly democratic, was adopted Aug. 10th, 1793; but its operation was suspended until peace should be restored. Meanwhile, the actual rulers of the country displayed marvelous energy; almost a million of citizens being placed under arms, and immense provision of all warlike stores made by means of requisitions. They also proceeded with merciless severity against their political opponents, dealing with them as traitors; hundreds of thousands were thrown into prison; and the number who died by the guillotine increased daily both in Paris and throughout France. The national convention itself latterly became subject to the dictatorial power of Robespierre; many of its members were guillotined within a few weeks; and independent opinion was no longer expressed. The overthrow of Robespierre was followed by a great reaction; the Jacobins were suppressed; and finally, the national convention, after concluding peace with Prussia and Spain, dissolved itself Oct. 26th, 1795 (4th Brumaire of the year IV.), leaving to the nation a new constitution, which placed the government in the hands of a directory (q.v.).

NATIONAL COVENANT. See Covenant.

NATIONAL DEBT. See Debt, National.

NATIONAL EDUCATION. The general subject of education has been already treated under that head. By the term "national education" is understood (1) the means taken by the body of any nation, either through the state or other organizations, for educating the people; (2) the objects which the nation ought to place before itself in its educational measures. These questions involve the whole inner and outer history of education, and are far too large and important to be capable of such treatment here as would convey accurate notions to the reader. All we can do is to glance slightly at the history of the two branches into which the subject divides itself. Among ancient nations, and among not a few nations now existing, education in any definite sense did not, and does not, exist for the masses of the people. The children grow up in reflective or unreflective imitation of their fathers. But at all times, nations which have quite emerged from the savage state, have had some more or less organized scheme of education for the leisured and governing classes. The purpose kept in view in such education has been to fit the pupils to discharge certain duties of war or government. In addition to this, the priesthood had the education which their traditionary hymns, laws, and customs afforded. That man as such, apart from any special practical ends, should be educated, was an idea late of being recognized, and occurred first to the Greeks, to whom the world owes so much. But neither among them nor their imitators, the Romans, was the education of *the masses of the people* ever contemplated. Education, properly so called, was confined to a few. In the centuries which succeeded the introduction of Christianity, the

church was the great educating body—training those intended for the service of the altar, not only in Christian doctrine, but in all the learning of the past. This, at least, was the general tendency of education in the church. But it was not till the reformation in the 16th c. that learning, even to the limited extent of reading and writing, was considered a worthy object of pursuit by any save those who, in some form or other, were destined to be drawn within the clerical ranks. The reformation introduced the idea of educating the masses of the people—the leaders of this movement being, no doubt, forced to this conclusion by the necessity which their view of man's personal religious obligations imposed on them. It was manifestly a corollary from the position they took up that *every man's* intellect should be so trained as to be able to read, and inquire, and think for itself. It was only very slowly that so large a conception of the sphere of education could be given effect to. Gradually, however, popular schools arose in many parts of the continent of Europe, especially in Germany, and the number of gymnasia or grammar-schools was, during the same period, increased. In Scotland, so early as 1696, the government took up the matter, and ordained that there should be a school as well as a church in every parish, at the same time providing for their maintenance by a tax on land, and for their management by putting them under a certain number of those who paid the tax conjoined with the minister of the parish—all being subject to the presbyteries within whose bounds they were situated. The example of Scotland cannot be said to have been followed on anything like a national scale by any country till after the French revolution had exhausted itself. Since 1815, the distinguishing idea of government administration may be said to be the necessity of educating *the people, and all the people*—even the outcast and the criminal. During the last fifty years, all the German states, and more especially Prussia and Saxony, have developed excellent national systems of education, and France has followed their example. Russia and the new kingdom of Italy are also now organizing primary instruction; and at the same time, as in all European countries, they are making provision for the instruction and professional training of the teachers in normal schools (q.v.) The schools for instructing the middle classes, and grammar schools (French, *lycées;* German, *gymnasiums*), whose object is to prepare pupils for the universities, have received increased attention. Universities themselves, too, have been further developed, their curriculums extended in range, their objects elevated, and their number increased.

To return to primary instruction. In England there was no national system, properly so called before 1870, but voluntary efforts were largely aided by the state in the form of privy council grants. These grants were also extended to Scotland, as it became necessary to supplement the parochial schools there, owing to the increase of population. The principal conditions on which these grants were made were that they were only to *supplement* local efforts, that the schools should pass a satisfactory examination before a government inspector, and that the Bible should be read in them. As much additional religious instruction might be given as the school managers pleased, but no schools were admitted to privy council aid from which the Bible was excluded. Under the stimulus afforded by these grants, the educational wants of England were, after 1839, to a great extent supplied; but many districts were left unprovided with schools, and many more very badly supplied. In 1870 an important measure, entitled "An act to provide for public elementary education in England and Wales," was passed by parliament, according to which it is enacted that "there shall be provided for every school district a sufficient amount of accommodation in public elementary schools available for all the children resident in such district, for whose elementary education efficient and suitable provision is not otherwise made." It is enacted further, that all children attending these schools whose parents are unable, from poverty, to pay anything towards their education, shall be admitted free, and the expenses so incurred be discharged from local rates. The new schools are placed in each district under "school-boards" invested with great powers—among others, that of compelling parents to send their children to school. An act in most respects similar to the above was passed in 1872 for Scotland, whose educational wants had previously been well supplied.

In Ireland, a national system, instituted and maintained by the state, exists, and one of its main features is the separation of the religious from the secular teaching—at least in theory. The extent to which this principle has been encroached upon in the course of working out the scheme, is not accurately known, but is worthy of special inquiry.

In the British colonies, as in the U. S. of America, adequate state systems of education have been provided on the basis of the secular principle. See the articles National Education, Systems of, and Privy Council, Committee of, on Education.

NATIONAL EDUCATION, Systems of, the provision made by various states for the education of their citizens. In England the term national education is commonly used as implying only a provision made for the instruction of children of the poorer classes. But it is capable of a much more extensive application, and in most of the countries in which the state provides for the education of the people, the state regulates, more or less, all instruction, from that of the primary school to that of the university. In England, national education in this sense has no existence. The parish schools (q.v.) of Scotland at one time were all but national, but the altered circumstances of the country

gradually deprived them of that character. The imperfect means adopted to supply the deficiency in both parts of the kingdom are described under the head of PRIVY COUNCIL, COMMITTEE OF, ON EDUCATION. See also COMMON SCHOOLS; EDUCATION; INDUSTRIAL SCHOOLS; REFORMATORY SCHOOLS, etc. In Ireland the foundation of a really national system was laid in 1833 in the "national schools" (supplemented since by the queen's colleges and university), the principle of which is briefly stated under IRELAND. These schools have exhibited a steady and even surprising progress, when we consider the determined opposition they have met with from powerful ecclesiastical parties, both Catholic and Protestant. In several of the British colonies the local legislatures have boldly dealt with the question on the national principle, in opposition to the denominational. See VICTORIA.

In this article we propose to give some account of the national system in various countries, and to indicate some of the matters as to which we have to look for instruction to foreign experience. Before doing so, it may be well to notice the obstacles in the way of the establishment of national education among ourselves. And first, in Great Britain the establishment of a national system of education, and of all interference with education on the part of the state, has until lately been opposed upon principle by a numerous and respectable body of politicians. They, for the most part, consisted of dissenters, who, beginning with voluntaryism in ecclesiastical matters, had passed on to the doctrine of *laissez faire* in politics. The others were chiefly speculative persons, deeply imbued with the same doctrine, who, profoundly disbelieving in the wisdom of statesmen and the capacity of officials, and apparently in the possibility of foresight in large affairs, held that the state should undertake as little as possible, and leave things to what they called their natural course. The arguments used by these two classes were not always alike. Individuals of the former class were apt to go back to the religious ground from which they started, maintaining that education ought to be religious, that the state ought not to teach religion, that therefore education was out of the province of the state. But what the spokesmen of both classes most insisted on was this: that education should be left to the law of supply and demand, or rather, to the voluntary action of individuals, single or combined. It was in that way, they declared, that the education of the people could be most beneficially carried on; for so carried on, it would always be, both in kind and in extent, what, on the whole, the circumstances of the people required. In the hands of government, they said, an educational system must be, more or less, an instrument of state. And, at the best, the extent and the quality of the instruction provided must depend upon the will of persons who might be very ignorant of the wants of the people. They used declamation about the bad way in which governments did everything they attempted; about the danger of creating a host of new officials; and about the impropriety of interfering with natural laws, and of discouraging voluntary agency. Then they enlarged upon the great progress which education had made in England since the beginning of this century, independently, as they said, of the state—maintaining not only that it had been as great as the circumstances of the country permitted, but that it was almost as much as the state had accomplished in any country; and that it proved that in England, supply and demand, or the voluntary principle, would soon provide for the education of the whole people. The greater part of the increase in the supply of education, so far as it was not due to the action of the state, had come from the benevolent exertions of individuals. But their chief reliance was upon the agency of individuals or societies inspired by benevolence or religious zeal. They held that the same objections did not apply to voluntary organizations which lay against the state; they declared that it was the great glory of England to accomplish, by such means, things which elsewhere were attempted only by the state. Combined voluntary action, they said, was consonant with the national habits and institutions; it was a part of the system which had made the English a free, self-reliant, and enterprising race; it should be fostered, not discouraged; and it was worth our while to pay a price, if necessary, rather than let it be superseded by the action of the state.

It was answered, first, that the commercial principle of supply and demand, unless supplemented by the benevolence of individuals, could not be expected to educate the people except by very slow degrees; that education must create the demand for education; that children of the lower classes in large towns, unless assistance or stimulation came to them from without, had at present no more chance of receiving instruction than if they were living in Africa. And the nation would lose incalculably by delay in educating the masses; for nothing would so greatly increase its power and prosperity, so materially improve the condition of the humbler classes, as the education of the whole people. The importance of voluntary agencies was admitted; but why was the state to be precluded from at least co-operating with them? The state, it was said, had a greater interest in educating the people than any of her citizens could have; and, moreover—this was the real question—could undertake it more successfully. Voluntary agency, it was maintained, was too slow, too uncertain, too spasmodic in operation, to be permanently and solely relied upon in a matter of such great national concern. The friends of state action confidently appealed to the experience of foreign countries as showing the superior efficiency of state education, and pointed to the effects which government stimulation, on a limited scale, had had at home. It is now several years since this controversy was at its height. The voluntaries have since that been acquiescing in the inter-

ference of the state with education; and recently, several of their foremost men have frankly admitted that they had been mistaken, and that the state, by what it has done for education, has made good its claim to the regulation of it. The course of political events has recently added greatly to the importance of popular education; and at present it may be said that there is practically no opposition upon principle to the control of education by the state.

There have always, however, been obstacles to the establishment of a national system more formidable than the opposition of private bodies, and these are well-nigh inevitable.

The most important of them are those which are concerned with the place, if any, to be assigned to religion in the school instruction. Upon this matter there is a conflict of opinions which seems almost irreconcilable. A party, which is growing in numbers, and which is respectable from its activity and intelligence, holds that the state should give nothing but secular instruction; that religion is beyond its province, and should not be taught within its schools; that, indeed, with a population divided into numerous sects, a practicable scheme of state education embracing religion cannot be devised. To this party a portion of the English voluntaries now seems disposed to ally itself. There are others who believe it possible to teach an undenominational Christianity in schools; who desire that the state schoolmaster should confine himself to this; and that dogmatic teaching should be left to the religious bodies. A third party hold that dogmatic teaching should be given in state schools; that religious teaching, to have any value, must be dogmatic; but that arrangements might be made for the religious instruction of children by persons of their own persuasions; and, at any rate, that children should be exempted from the religious instruction given in a school if their parents should so desire. The most numerous body of all are satisfied with the system of aiding denominational schools which now exists; because they approve of schools being, as for the most part they now are, under clerical supervision, and fear that by any change the influence of the clergy upon education would be weakened. Among the managers of church of England schools fault is scarcely found with more than one point in the old substitute for a system; there was an incessant agitation against the "conscience clause," which the state has placed among the conditions of its aid, stipulating that religious instruction should not be given contrary to the wish of the parent. Between the denominationalist and the secularist there is a difference which scarcely admits of compromise, and is a serious hindrance in the way of any national system. The former is naturally opposed to any scheme for supplementing the denominational system—for the purpose of educating the classes which this system does not educate—unless it include religious teaching.

The question of religious instruction has been found a troublesome one in nearly every country where the state regulates education, and there is nothing more instructive, in foreign experience, than the ways in which, in different systems, this difficulty has been disposed of. Next to this, the most important thing to be observed is the parts which, in different systems, are assigned to the state and to the locality respectively; for it is unquestionable that there are some dangers attaching to state education, when the influence of the state is predominant, and that the function of the state in education must be carefully defined. By the mere selection of school-books, the state could powerfully influence the rising generation; and in Austria, and, it is said, in France also, the school has been made use of as an instrument of state policy. With a popular government, however, there is not much risk of it being used for sinister purposes; and in this country we are in more danger of having recourse too little to the powers of the state than of trusting it too much. The possibility of making education compulsory is another matter upon which foreign systems of education throw much light: we are perhaps more interested in noting how far indirect methods can be resorted to for compelling attendance at the schools. Upon the limits of the instruction which should be attempted in schools for the poorer classes—a subject which has been much discussed in connection with the Revised Code of 1861—and upon the results of government regulation of the middle and upper schools also, there is much to be learned from the foreign educational systems. We begin with

State Education in Holland.

There are several countries in which—if school statistics could be taken as a test—popular instruction is more widely diffused than it is in Holland; but in no European country is it so uncommon to meet a man who cannot easily read and write. The primary schools of Holland have a high reputation for the solidity of the instruction they impart, and have, by competent observers, been declared to be the best in Europe. A small and wealthy state—rich, too, in the public spirit of its citizens—with a population singularly docile and orderly, the task of educating the people has been for Holland exceptionally free from difficulty. It had the start of most other European nations in the work of popular education. So far back as 1811 its primary schools had been celebrated in a report by the famous Cuvier. It has had an education law since 1806; and of this law, though it underwent modification in 1857, it is necessary to give some account. Secondary education in Holland was officially instituted and organized for the first time by the law of May, 1863.

On the face of it, the law of 1806 seemed far from making a complete provision for

the education of the people; it left much—in any other country, it would have been a great deal too much—to the public spirit of local authorities. It did not make education compulsory; it did not even enforce the establishment of public schools; but it provided for two things being done thoroughly—the inspection of the schools and the examination of the teachers—and to this seems to have been chiefly due its eminent success. Each province of Holland was formed into a certain number of school-districts, and over each school-district was placed an inspector. The inspector was made supreme over primary instruction in his district. He was a member of every school-committee, and school-committees could be named only with his concurrence; no teacher, public or private, could exercise his calling without his permission; and he inspected every school in his district twice a year. The united inspectors of the province formed the provincial commission for primary education. This commission met three times a year, and received from each of its members a report upon his district; once a year, it sent a deputy to the Hague, to form with the deputies from other provinces, a commission to discuss and regulate school-matters, under the direction of the minister for the home department and his inspector general. The inspectors in the various provinces were appointed by the home office, on the presentation of the provincial commission. It has been said that in Holland public spirit is very strong. State employments are thus deemed very honorable; and the inspectors gave their services gratuitously—receiving only an allowance for expenses. It was one of the duties of the provincial commission to examine teachers for certificates. First, the teacher had to get a *general admission*—a certificate of competency, admitting him into the teaching profession; he had to get a *special admission* also, before he could exercise his profession. There were four grades of certificates—the first or second grade had to be obtained by a school-master, public or private, in the towns; the third grade qualified for a village school; the fourth grade was for under-masters and assistants. To the highest grades were admitted those candidates only who gave signs of a *distinguished culture*. For public masterships, when they fell vacant, a competitive examination was held; the successful candidate received his *special admission*—his appointment to exercise his profession in the school. For special admission as a private teacher, there was no second examination; it was in the power of the municipality, with the concurrence of the inspector, to grant it upon application. Although there were no obligatory provisions in the law, the provincial and communal administrations were charged by the government to provide the means of instruction in their localities, to insure a comfortable subsistence for teachers, and to obtain a regular attendance of the children in the schools; and they did all this to the best of their ability. Free schools for the poor were provided in the towns; in the villages, schools to which the poor were admitted gratuitously. Every effort was used, both by the lay authorities and the clergy, to draw poor children into the schools; and the school-masters were provided with incomes much superior to what is usually paid to school-masters in any other European country. To this M. Cuvier attributed much of the success of the Dutch schools. Some of the best scholars were kept in the school to assist in the teaching; they became under-masters, and eventually masters; and thus, even before the institution of normal schools, an efficient body of teachers was provided. In the normal schools which were afterwards established, school-methods and the practice of teaching formed a more prominent part of the instruction than in those of other countries. It soon appeared that the free schools for the poor in towns were giving better instruction than could be obtained by the lower middling classes; and intermediate schools had to be established in the towns (*tusschen-schoolen*), in which, for a small fee, an excellent education was provided. Above the intermediate school was the French school, in which, besides a sound commercial education, modern languages were taught; above that was the Latin school, giving a classical education, and preparing for the universities. The classical schools and the universities of Holland do not receive from foreign observers the commendation so freely bestowed upon the other parts of the educational system of the country.

Under this law, the public schools were non-denominational; no dogmatic instruction was to be given by the teacher or in the school; but the instruction was to be such as to "train its recipients for the exercise of all social and Christian virtues." The religious education of the children, however, was not overlooked. The government exhorted the clergy of the different communions to take upon them the religious instruction of children of their own persuasions; and this the clergy willingly did—giving up a portion of every Sunday to this duty. The school-master instructed the children in the truths common to all religions, and on Saturdays, when the Jews were absent, in the New Testament and the life of Christ. M. Cuvier, in 1811, stated that he found the education religious, though not dogmatic; and in 1836, high satisfaction with it was expressed by M. Cousin, an earnest advocate of religious education. It was thought that the Dutch schools had proved the possibility of teaching in schools an unsectarian Christianity. But it was chiefly upon this point that the controversy arose which led to the enactment of 1857; and as regards it, it cannot be said that the controversy is yet ended.

There were other matters which excited a demand for the alterations then made in the law. The constitution of 1848 had granted the liberty of instruction, and was therefore in conflict with the law of 1806. The school-attendance had been falling off. Some of the municipalities had been evading their duty to the school-masters and the schools.

It was thought desirable that the duties of the commune in regard to education should be carefully defined by law. The changes made, however, were not of much practical importance.

The law of 1857 granted "liberty of instruction;" still requiring from the private teacher the certificate of competency, it rid him of the veto of the municipality and the inspector. It expressly prescribes that primary schools, in each commune, shall be at the commune's charge; they are to be in sufficient number; and the states' deputies and the supreme government are to judge whether, in any commune, they are in sufficient number or not. If the charge of its schools is too heavy for a commune, it receives a grant in aid, of which the state and the province each contributes half; but there is no fixed point at which the commune can demand this aid. The law fixes the minimum salary for a schoolmaster at 400 florins (about £34); for an under-master at 200 florins. (The schoolmaster's salary, however, is usually much higher; in towns, not unfrequently four times as much.) It provides that when the number of scholars exceeds 70, the master is to have the aid of a pupil-teacher; when it exceeds 100, of an under-master; when it exceeds 150, of an under-master and assistant; for every 50 scholars above this last number, he is allowed another pupil-teacher; for every 100 scholars, another under-master. School-fees are to be exacted only of those who can afford to pay them; and the municipalities are enjoined to "provide as far as possible for the attendance at school of all children whose parents are in the receipt of public relief." The law defines the subjects of primary instruction as follows: Reading, writing, arithmetic, the elements of geometry, of Dutch grammar, of geography, of history, of the natural sciences, and singing. There is still a competitive examination for the office of public schoolmaster; a list of those who have acquitted themselves best is made up by the inspector and a committee of the communal council, and from this list the selection is made by the whole body of the council. For the provincial commission, consisting of the inspectors of the province, there has been substituted a salaried provincial inspector; and the provincial inspectors are assembled once a year to deliberate upon the state of primary instruction. The minister of the home department, assisted by a referendary, is the supreme authority in matters connected with education.

Upon the subject of religious instruction, the law was left unaltered. The enactment of 1857 provides as follows: "Primary instruction, while it imparts the information necessary, is to tend to develop the reason of the young, and to train them to the exercise of all Christian and social virtues. The teacher shall abstain from teaching, doing, or permitting anything contrary to the respect due to the convictions of Dissenters. Religious instruction is left to the different religious communions. The schoolroom may be put at their disposal for that purpose, for the benefit of children attending school, out of school-hours." This was the conclusion arrived at, after much excited discussion.

In 1848, all religions were, in Holland, placed by the law on a perfect equality; and immediately thereafter, an attack was begun by the Roman Catholics on the religious instruction of the schools. Professedly neutral, they maintained that it was really Protestant, and probably they were right. The schoolmasters, on the demand of the Roman Catholics, were enjoined to comply mere strictly with the law; and thereupon there began among the orthodox Protestant bodies a violent agitation against the law—a movement for connecting every public school with some religious communion. The Roman Catholics, believing that in Holland neutral schools must be Protestant, desired that the instruction should be purely secular; and a considerable party among the Protestants contended for the same object. The only party in favor of the existing law were the rationalist or new-school Protestants, who attach more importance to the moral and civilizing side of Christianity than to its dogmatic aspects. Between the denominationalists on one hand and the secularists on the other, the victory fell to this last party. Of course, the decision was a compromise; and neither the high Protestant party nor the Roman Catholics regard it with satisfaction. The consequence has been that, advantage being taken of the newly-conceded freedom of instruction, there has been a great increase in the number of private elementary schools conducted on the denominational basis. The non-denominational school in Holland cannot be considered entirely successful, since the opposition to it seems to be leading to primary education being to a considerable extent taken out of the control of the state.

State Education in Switzerland.

In no part of Europe has the education of the people been more successfully prosecuted than in Switzerland. In all the cantons, French and German, it has been carefully attended to by the governing bodies; and for small communities, provided the rulers have intelligence and public spirit, it is comparatively a simple and easy task. To those who are interested in school-methods and school-management, nothing can be more instructive than the education of the German cantons. Their primary schools are unsurpassed; those of the canton Aargau have a reputation of being the best in Europe. The experience of the French cantons throws light upon more than one of the questions which occur in the construction of a national system. It is with the latter class of questions that we are concerned; and to the French cantons—Geneva, Vaud, Freiburg, Neufchatel, and Valais—the following statement is confined.

In these five cantons, the school-system was, until recently, the same in its main out

lines; it was a system designed to put public education in harmony with the democratic constitutions established after the war of the Sonderbund. In Vaud, it was founded in 1846; in Geneva and Freiburg, in 1848; in the Valais, in 1849; and in Neufchatel, in 1850. In Freiburg, it underwent modification in 1856. Its main features were as follows: The communes were required to provide and maintain public schools, the state assisting them when the charge became too heavy. In general, every place with more than 20 children of school-age was required to have its school; every place with more than 50 or 60, a second school; and so on. Infant-schools were recommended and aided by the state, but their establishment was not made obligatory. The council of state—the supreme executive—of the canton appointed a board of public instruction to exercise the government of education; but in important matters, an appeal lay from this body to the council; and by the council only could a master be dismissed. The municipality appointed a communal school-committee, which had the local superintendence of the schools. Ministers of religion were eligible for this body, but were not members of it by virtue of office. It was the duty of the school-committee to visit the schools of its commune not less than once a fortnight, besides holding a public general examination of them once a year. The teacher required to get a certificate of capacity; the examinations for the certificate being under the management of the board of public instruction. In Vaud, however, five years' service in a public school exempted a teacher from the obligation of a certificate; and in other cantons, it does not seem to have been rigidly insisted on. For vacant masterships, there was a competitive examination, to which persons qualified by certificate or service only were properly admitted; in Vaud, however, failing qualified persons, other candidates might be admitted to examination, and provisionally appointed. In Geneva, Freiburg, and Valais, there were school inspectors who periodically reported to the board of public instruction; Vaud and Neufchatel had no inspectors; the duty of inspection in these cantons devolved upon the school-committee. The subjects taught were religion, reading, writing, grammar, arithmetic and book-keeping, geography, Swiss history, and singing. The instruction given had two or more degrees (in Geneva, six degrees), according as these subjects were taught with more or less extension; instruction in both degrees being usually given in the same school, and by the same master. Education was to be based upon the "principles of Christianity and democracy." Hours were to be set apart for religious instruction; from the ordinary school-lessons dogma was to be strictly excluded; and it was regarded as the province of the minister of religion, not of the schoolmaster, to give religious instruction, though the latter was not prevented from giving it in the room of, and under the responsibility of a minister. In all the cantons, except Geneva, educations was made compulsory; attendance at school was required from the 7th to the 15th, or from the 8th to the 16th year. If children were privately educated, the state must be satisfied that their education was sufficient; such children could be called up for examination with the scholars of the public schools, and if found inferior, might be transferred to a public school. A certificate of emancipation was granted when the obligatory course had been fulfilled. The law contemplated that the instruction should be gratuitous, and in Geneva and the Valais it was gratuitous.

In Freiburg the school-system was framed in no small degree for the purpose of strengthening the democratic party against the clerical party. It provided that no religious society should be allowed to teach; that persons educated by the Jesuits should be incapable of holding any office in church or state; it imposed a political oath upon the schoolmaster; it prohibited children from being sent to a private school, except with the sanction of the inspector and the school-committee; and if sent, required that they should come up for examination every half-year. At the same time it established an excellent programme of primary instruction. At the elections of 1856 the clerical party regained the ascendency in Freiburg; and in Jan., 1858, the council of state made a considerable alteration in the school-law. It reduced the programme of primary instruction; it made the clergyman a necessary member of the local school-committee, freed the teacher from the necessity of taking an oath, and relaxed the obligation of attendance at the public schools, giving parents liberty to educate their children at home or at private schools. In other respects, the system, as above described, has been maintained in Freiburg. There has been no change in the other cantons.

The law as regards religious instruction seems to work with tolerable smoothness. In Vaud, it appears that the laxity which prevails as to the requirement of a certificate sometimes leads to the admission of unqualified persons as teachers; and in Vaud and Neufchatel, complaint is made of the incapacity of the school-committee to make up for the want of professional inspection.

In the 4 cantons in which education is by law compulsory, the school-attendance is found to be no better than in Geneva, where it is not compulsory. In these cantons, the law provides that parents not sending their children to school are to be warned; if the warning be neglected, that they are to be summoned before the tribunals, which can punish them by fine or imprisonment. But it appears that, in point of fact, the tribunals are never resorted to; and that the authorities are careful not to insist upon more than the people are easily able and willing to comply with. In the Valais the school-year need not last for more than 5 months. In Freiburg the vacation may last for 3 months; and the inspector may exempt from attendance at school children who are sufficiently

advanced, and children whose labor their parents cannot do without. In Vaud, the local school-committee may grant to children above 12 years of age, whose labor is necessary to their parents, dispensations which in a great measure exempt them from attendance at school; the master may grant the scholar leave of absence for 2 days in the week; the president of the school-committee may grant him leave for a week at a time; the school-committee itself for a month at a time. It appears that in Vaud, the attendance at the schools had been steadily falling off from 1846, the date of the law, up to 1858; and the attendance of the children whose names were on the books was then reported to be by no means regular. New branches of industry which gave employment to children had been introduced into the canton; and the council of public instruction seems to have been compelled to sacrifice the law to the interests of families. The experiment of compulsory education cannot be said to have succeeded, because it has not really been made, in French Switzerland.

State Education in France.

At the head of the education of France is the minister of public instruction; he is advised and assisted by the imperial council of public instruction, a body the members of which are appointed by the crown for the period of a year. The minister, if he thinks fit, brings before the council for discussion projected laws and decrees on public education; he is bound to consult it respecting the programmes of study, methods, and books to be adopted in all classes of public schools. The minister has succeeded to the functions in respect of education which, under the first empire, were conferred upon the university of France; he is head of the university, the officials of which still perform a considerable part in the management of education, but do so under his control. As respects the higher and the professional education, the university is both a teaching and an examining body, granting degrees under conditions prescribed by the minister and council. The administration of the secondary instruction is committed to it, and it shares in the supervision of the primary instruction. It is composed of 18 *academies*, each of which comprehends several departments. These academies are so many local centers of the department of public instruction. At the head of each is a rector; the chief officials under him are called academy inspectors. The minister of public instruction is also rector of the academy of Paris.

The academy officials, under the control of the minister, have the superintendence of secondary instruction in the departments within the academy's jurisdiction; there is an inspector for each department. The instruction is minutely regulated, as to the quantity to be provided, as to the subjects to be comprehended in it, and as to its cost; it is the chief duty of the academy inspectors to see that the requirements with respect to it are complied with. The inspection is said to be highly efficient. The lyceum is the principal seminary of secondary instruction; in general the chief town of every French department has its lyceum. There is, besides, the communal college. Every town of considerable population has its communal college. The lyceum is founded and maintained by the state, with aid from the department and the communes; the communal college is founded and maintained by the commune, with occasional aid from the state. The instruction given in the communal college and in the lyceum is substantially the same in character; in the lyceum it is the more extensive. To the lyceum there is usually attached a preparatory school for the younger boys. In both lyceums and communal colleges there are boarders and day-scholars. French, Latin, Greek, and mathematics are the principal subjects of instruction; arithmetic, history, geography, modern languages, and the natural sciences are also taught. The course at the lyceum lasts for six years, and qualifies for the degree of bachelor of letters. Religious instruction is given—to the Roman Catholic boys by chaplains attached to the school; to the Protestants, by a Protestant minister specially appointed to this duty; and the New Testament in Greek or Latin is read daily by every class. In the lyceums, the average charge for day-scholars is from 110 francs ($22.00) to 180 francs ($36.00) a year; the charge for boarders from 800 francs ($160) to 900 francs ($180), according to their age and advancement. In Paris, the charges are higher—from $190 to $300 a year for boarders, and from $30 to $60 a year for day-scholars; on the other hand, there are lyceums where the highest charge for boarders is $110 a year. There are public scholarships (bourses) founded by the state, to be obtained by competition, the holders of which are relieved from all cost. The education given is in no respect much inferior—and in some respects it is superior—to that which is to be had at an enormous cost at the best English public schools; it is far superior to that which, at a far higher cost, is ordinarily given to children of the middle classes in England. A private secondary school cannot be opened without notice to the public authorities: they must be satisfied that the premises are suitable; and the director must have a certificate of probation—showing that he has served five years in a secondary school—and a certificate of competency obtained at the public examination for secondary teachers. The academy inspector inspects private secondary schools, but only to see that the pupils are properly lodged and fed, and that the teaching contains nothing contrary to morality and the laws. The minister may, however, dispense with the certificate of probation, and holy orders are accepted in lieu of the certificate of competency.

A law, dated June 21, 1865, founded a new course of study in secondary schools—a

special secondary instruction. The object of the special secondary instruction is declared to be to "found the sub-officers of industry;" instruction in living languages is substituted for the classical instruction of the secondary schools; the elements of science and its applications receive great attention—particular regard being had to the teaching of agriculture and the sciences which bear upon it. The teaching, moreover, is intended to impart what may be called a sound French education. A normal school has been founded at Cluny for the preparation of masters for this special secondary instruction.

For primary instruction in France an excellent basis was laid by M. Guizot's law of 1833, of which, indeed, the more important provisions have been retained. Since the re-establishment of the French republic education has repeatedly been the subject of legislation; in the main, the provisions as to primary education are regulated by the laws passed between 1850 and 1867. Every commune must maintain an elementary school, either by itself or in combination with other communes; in founding and maintaining its schools it is to be aided, if necessary, by the department and by the state. It must have taxed itself specially for the schools three centimes per franc of rental before it can claim aid; the department must have taxed itself specially two centimes for the communal schools before the state is resorted to. Up to the present year a certain number of poor children—the number determined for each school by the prefect of the department—were admitted to the school gratuitously; for others a fee was charged, which was collected every month by the tax-gatherer. The state contributed whatever was necessary in addition to the communal and departmental taxation and the school-fees. The law of the present year, however, provides that all children are to be admitted gratuitously whose parents would have difficulty in paying the school-fee; and that a commune whose taxation amounts to four centimes additional may dispense with the school-fee altogether, the deficiency, if any, so arising being made up by the state. In the large towns the schools have long been gratuitous—the communes often taxing themselves for school-purposes beyond the amount required by law. Up to the year 1867 the law did not oblige the communes to maintain separate schools for girls, though a large proportion of them contributed towards the maintenance of such schools. The law of 1867 provides for the establishment of girls' schools; the cost of them falls in great measure upon the state. Primary instruction was made absolutely free, 1881; obligatory, 1882.

Religious instruction is given in every school. In France, the Roman Catholic, the Protestant, and the Jewish forms of worship are subsidized by the state; and it is provided that, in communes where more than one of these is publicly professed, each form is to have its separate school. The departmental council, however, has power to authorize the union, in a common school, of children belonging to different communions. For such cases, it is provided that ministers of each communion shall have free and equal access to the school, at separate times, to attend to the religious instruction of members of their own flock. To a school appropriated to one denomination, no child belonging to another is admitted, except at the express demand of his parent or guardian, signified in writing to the teacher. Denominational schools are now the rule, common schools the exception. Previously to 1850, under M. Guizot's law, common schools were the rule, but it was found that in them the religious instruction presented grave practical difficulties. All the religious bodies appear to be satisfied with the present system. The schools, though denominational, are communal schools; the denominations have not the management of them; and they are all subject to the same inspection.

The mayor and the minister of religion in each commune have the supervision and moral direction of the primary school; in practice they are strictly confined to matters connected with its morality. Cantonal delegates are appointed by the departmental council (the canton is a division larger than the commune), who inspect the primary schools of their canton; but they have no real authority over the schools; they are only allowed to make representations as to the state of the schools to the departmental council, or to the inspector. The departmental council has the chief part in the regulation of the primary schools; moreover, no private primary school can be opened without its permission; and if it refuse permission, there is no appeal. It is the prefect, however, who has the power of nominating, suspending, and dismissing public primary teachers. His authority is usually exercised upon the report of the academy inspector—the university official whose important functions, in respect of secondary instruction, have already been described. The academies have the charge of the normal schools of primary instruction, and the supervision of the primary schools as regards the methods of teaching and course of study. Under them are the primary inspectors, who report to the academy inspectors; above the latter, as regards primary instruction, there are four inspector-generals, attached to the office of education at Paris. It is the primary inspector who really superintends the instruction of the schools; his labors are unceasing, his inspection is a reality, for he is not required to give notice of his visits. The private primary schools are subject to his inspection, but only as regards the provision made for the bodily health and comfort of the pupils and the maintenance of morality.

The subjects which must be taught in every primary school, in addition to moral and religious teaching, are reading, writing, arithmetic, the elements of French grammar, and the French system of weights and measures; there are other subjects which are facultative—which, in whole or in part, may be taught, that is, if the council of the

commune should so desire, and the departmental council give its consent. These facultative matters are the applications of arithmetic; the elements of history and of geography; the elements of physics and of natural history; elementary instruction in agriculture, the arts, and hygiene; surveying, leveling, drawing, singing, and gymnastics. For girls, there are superior primary schools which teach the facultative matters only; and in girls' schools instruction is usually given in needle-work for about three hours a day.

For the preparation of male teachers, the law requires every department to maintain a normal school; in some cases, however, two departments are allowed to maintain one jointly: there are now 70 of these schools. There are separate normal schools for female teachers; of these, the number was recently 34; now that the law is about to add largely to the number of girls' schools, it will probably be increased. The members of the religious orders devoted to teaching, which perform a great part in primary education, are trained for their duties in the establishments of their respective orders. (Of these orders, the most important is that of the brethren of the Christian schools.) The instruction of the normal schools is meager; it scarcely exceeds the subjects of primary instruction; a considerable proportion of the students, indeed, acquire only an imperfect knowledge of the facultative subjects. School-method is what, in the normal schools, it is deemed most important to teach. The examination for primary school-masters—which is conducted by a commission appointed by the departmental council—is limited to the subjects taught in the schools. There are two classes of certificates, according as the teacher passes in the obligatory subjects only, or in the whole or part of the facultative subjects also. Every male teacher, public or private, is required to have the certificate of capacity granted after an examination; also, excepting in the case of religious persons, a certificate of morality. The law recognizes a certificate of stage, to be granted to assistants who have served as such for three years, as a substitute for the certificate of capacity, but this provision has been unpopular, and the qualification of stage is practically unknown. Female lay teachers require the certificate of capacity; female teachers of the religious orders are exempt from it. No person can be appointed a regular communal teacher unless he be twenty-four years old, and have served for three years since his twenty-first year as an assistant, or as a *supplying* teacher. The supplying teacher gets a lower salary, and may be employed in the poorer communes. The salaries are low even in the towns · in many of the country communes, the legal minima are not exceeded; these are—for an ordinary communal teacher, $120 a year; for a female teacher, or a supplying teacher, $100 a year. The commune pays $40 a year, besides the school-fees; whatever is required to make up the legal minimum, the government supplies; and, since 1862, the government has, upon certain conditions, made slight allowances in addition to the minimum.

It is in secondary instruction that the education of France has a decided superiority over that of England. The primary instruction is scarcely equal to that given in English schools of the same grade. Mr. Matthew Arnold has reported that, in 1859, he found in French primary schools the writing fair, but scarcely so good as in English schools; the reading better, the arithmetic much better, than in English schools. Of history and geography, the pupils were far more ignorant than English school-children of the same age. The ministry of M. Duruy, however, was an era of marked improvement; much more attention is given to the facultative matters now; especial attention to agriculture and the subjects connected with the daily life of the peasant. Mr. Arnold came to the conclusion, that even in the great towns there were no masses of children left altogether uneducated, that almost all passed at some time through the schools. Adult classes, taught in the evenings, have greatly increased in numbers of late years, and are now aided by the state.

In 1834—just after the passing of M. Guizot's law—the number of primary schools, public and private, was 10,316; in 1857 it was 65,100; in 1872 it was 70,180, of which 38,850 were boys' or mixed schools, 17,460 girls' schools, and 11,000 were free schools. In the primary schools alone there were, in 1872, 4,722,000 scholars—3,500,000 more than the number of scholars in 1829. In 1872, the year of the census, a careful inquiry was made into the condition of the French people with regard to primary education. Of the total population above the years of childhood, it was found that 30.77 per cent could neither read nor write, 10.94 could only read, and but 58.29 could do both. There was a most extraordinary difference between one department and another in this respect, the percentage of utterly illiterate persons ranging from 6.9 per cent in Doubs to 61.8 in Haute-Vienne; the most favorable figures indicating universally the north-eastern departments. In 1872 the state and the communes expended 85,000,000 francs on primary education alone. The item of public instruction stood at $173,734,849 f. in the budget of 1891. For the means of higher education in France, see UNIVERSITY (*French University*).

State Education in Prussia.

In all the Protestant states of Germany, the school -system in its main features is the same. The Prussian system—more celebrated, more extensive, more practical and thorough than the system of the minor states—always powerfully influencing these, and now likely to influence them more than ever, is that which must be selected for description. About this system, M. Cousin, by a strange confusion between it and a project of law—a mere scheme drawn up by the education minister, Von Altenstein, never even

proposed for legislation—spread misconceptions throughout Europe, which have scarcely yet been dispelled. It has been greatly changed, greatly improved since Cousin wrote in 1831; but it does not yet in symmetry and completeness approach to what he described.

In Prussia, there is a minister of public worship and instruction; but the officials who under him carry on the government of education are the officials of the department of the interior. At the head of the government in each province is a president; over each of the departments into which the province is divided there is a prefect (*bezirk*); each of these officers is assisted by a council, of which one section, called *schulcollgium*, forms a separate council for deliberating upon the local school affairs. One member of the school-council, called provincial school-councilor, is associated with the president for administrative purposes: the prefect has attached to him two departmental school-councilors, one Protestant, one Catholic, to advise with him, and to adminster the school-affairs of their respective communions. There is practically a division made of educational affairs between the officials of the province and those of the department. The provincial school-councilor takes the charge of secondary education within the province, the departmental school-councilors the charge of the primary schools of the department.

Over each of the circles into which the department is divided is an officer termed a *landrath*, who reports to the prefect of the department. With the landrath, in the management of primary schools, is associated the *superintendent*, the church dignitary of the circle. The superintendent is *ex-officio* inspector of the primary schools within the district. The parish clergyman is *ex-officio* local inspector of primary schools within his parish. There is also for the school or schools of each parish a board of managers, the composition of which varies in different provinces. The clergyman is always a member of it: he is usually chairman. In country places, the whole powers of the board are often left in his hands

In the "exterior" affairs of the school—passing school-accounts, visitation of school-premises, control of the school-estates, adjustment of the school-rate, etc.—the landrath is associated with the superintendent. Its "interior" affairs, all that concerns its teaching and discipline, are subject to the established regulations, under the superintendent's control; but, in practice, they are more under the influence of the departmental school-councilor. The superintendent, however, is required to visit the school, and to watch over the conduct of the local inspector, and he reports annually to the government of the department. The local inspector's province is the interior affairs of the school. He is expected to visit the schools diligently, and to be active in the supervision of them. The religious teaching of the children is almost entirely done by him, it being his duty to prepare them for confirmation, which comes at the end of the school-period. To qualify them for the duty of school-inspection, the candidates of theology are required to attend for six weeks as auditors at a normal school, and to have attended a course of *pädagogik* at the university. Nevertheless, it appears that many clergymen are very ill fitted for this work, and that their powers of interference are often exercised in ways annoying to the master, and detrimental to the school. The "exterior" affairs of the school of a parish belong to the board of managers.

This board is usually composed of representatives (1) of the patrons, if any, of the school; (2) of the parochial clergy; (3) of the municipal body; (4) of the householders. It has a stated meeting once a quarter; it meets whenever it is summoned by the chairman. It manages the revenue and expenditure of the school, in respect of which it is responsible to the landrath; it is the trustee of the school-buildings and property. It is its duty to see that the regular school-hours are kept; that no unauthorized holidays are given; to it application must be made for dispensations for periods exceeding a week. Its members should be present at all examinations and other public solemnities of the school. In the large towns there are school-delegacies appointed by the *magistrat*, whose powers are more extensive, and are in practice the greater, because in the large towns the pastors pay little attention to the schools. The school-delegacies have control over the higher as well as the primary schools which their constituents maintain; two paid members—school-delegates—who must be members of the *magistrat*, exercise the greater part of their authority. Under the delegacy, for every school there is a school-board, consisting of the clergyman and two lay members, whom the delegacy appoints. The delegacy itself is accountable to the magistrat, and both are subordinate to the provincial council.

Every commune is bound to find school-room and teachers for all the children of school age belonging to it. The amount of the teacher's stipend is in every case fixed by the departmental government; there is no legal minimum; the salaries are usually very low. Some parishes possess endowments; but, in general, the cost of maintaining the schools is defrayed by means of (1) school-fees; (2) a local rate; (3) a grant from the national treasury. As children are only expected to pay what they can, and as the state grants aid only after the strictest proof of the incapacity of the commune, the weight of the burden falls upon the local rate. The maintenance of the schools ranks with the first charges upon the local purse. The teacher is appointed by the departmental councilor; in a few towns, however, a certain power of choice is allowed to the municipal authorities—they may select one from a number of candidates presented to them by the government.

School-attendance is by law compulsory for eight years; the school age beginning at the completion of the fifth year. But in most parts of Prussia, children, though allowed, are not compelled to attend till the completion of their sixth year. The school-period

closes with confirmation. A register of all children of school age is made up—usually at the police office; every child is registered for a particular school; there, whatever his rank, he must attend, unless a dispensation be got for him from the landrath. When a dispensation is applied for, the parents must state the motives of the application, and the provision to be made for the child's education. All persons officially connected with schools are expected to use their influence to secure regular attendance; but failing moral suasion, there are other means of enforcing it. The school-master keeps a list of absences, excused and inexcused. When a child's attendance is irregular, the board of managers admonishes its parent. If admonition—which in general is repeatedly resorted to—has no effect, a statement is sent to the police office; the parent is fined a small sum for each day of the child's absence since the last admonition; and the fine can be levied by execution, enforced by imprisonment, or taken out in parish labor. It seems that very few children escape registration; but the regularity of the attendance—in general it is very regular—varies considerably in different districts; the execution of the law being strict or otherwise according to the temper of the people, their circumstances, and the vigilance of the school-authorities. There are no statistics by which the success of the law can be exactly tested. In some of the larger towns the demand for child-labor and the growth of pauperism are adding to the difficulty of enforcing it. Prussia has a factory-law requiring that every child employed in a factory shall attend school for three hours a day, and this law is strictly enforced.

Teachers of every class, public and private, have to pass two examinations. Certificates are of three degrees of merit—they may be marked "very well qualified," "well qualified," or "sufficiently qualified." The heads of examination are "religion, the German language, the art of school-keeping, geography of Prussia, arithmetic and geometry, knowledge of natural objects, writing, drawing, singing, and the theory of music, organ." After the first examination the candidate is eligible as an assistant or provisional master; he must serve in this capacity for three years before taking the second; he must pass the second within five years. The second examination is in the same subjects; but now most weight is given to the art of school-keeping. Of the subjects taught in primary schools the principal is religion; the others are reading, writing, arithmetic, singing, and the elements of drawing. Incidentally, the teacher may communicate information about natural phenomena; about geography, beginning with that of the locality, and the history of Prussia. The teaching was much more ambitious before 1854; before 1854, also, the normal schools, now limited to a meager programme, were universities on a small scale, aiming at the mental training of their students, rather than at fitting them to teach elementary schools. The change is often ascribed, both in Prussia and out of it, to political motives, having been made by a party unfriendly to popular education; but eminent educationists defend and approve it. The schools, they say, are now attempting as much as can be thoroughly done in the time allotted for primary education, and are doing it thoroughly; while the showy teaching of former times, with its endeavor to develop the faculties, and to communicate knowledge, neglected the indispensable elementary instruction, and, as regarded the greater number of the scholars, was in no respect successful. The normal school training, it is said, now fits the teacher for his duties and his position in life; formerly it rather unfitted him for them, while fitting him perhaps for something better. It is, however, admittedly a defect in the Prussian system that it offers to the humbler classes no opportunity of carrying their education beyond the point at which the elementary schools leave it. In some of the towns there are improvement institutes, where young persons are taught in the evenings or on Sundays; but they attempt little, are badly organized, and are neglected by the school administrations. It should be stated that the town schools often teach somewhat more than is taught in country places—more geography, history, and natural knowledge—but this, though permitted, is not encourged by the authorities. Grammar is entirely excluded from primary instruction. The only part of the teaching which is less than excellent is the writing: it has been stated that upwards of 50 per cent of the recruits are unable to write—the art, never perfectly mastered, being lost, it must be supposed, through want of practice.

As regards religious instruction, the rule is that the primary school is denominational—public schools are set apart, that is, for children of each of the religious bodies; the clergyman who has the charge of the school is the clergyman of the body to which it is appropriated. Besides the "evangelical establishment," in which Lutherans and Calvinists are combined, there are the Roman Catholics and the Jews to be provided for; of other sectaries, there are not 10,000 in all Prussia. The Lutherans and Cavinists are combined in the school as in the church. Dissenters are allowed to withdraw their children from the religious instruction, and have it given by their own pastor. Any commune may establish a mixed school, if it so desire, and if the authorities permit; but, in practice, mixed schools are only to be found where it would be very inconvenient to establish a school for each body. In mixed schools the teacher are chosen proportionately from each of the two great religious bodies; if there be only one teacher, it is, in some districts at least, customary that he should be alternately a Protestant and a Catholic. The experiment of mixed schools had a long trial in Prussia, and was found to be unsatisfactory, leading to attempts, or suspected attempts, at proselytism, and to parish squabbling. It has been abandoned, not so much from the wish of the government, as

in deference to the feelings of the people, and to the demands of the Roman Catholic hierarchy. But the denominational system is more in accord with the part which the state assigns to religion in the school. The school, it is said, should be the organ of the church for training children to church-membership; school and church are expected between them to form the child into a man contented with his position in life. Religious teaching must be given by the master for an hour every day. In the Protestant schools the master teaches the Lutheran catechism to Lutheran children; the Heidelberg catechism to the Reformed children. Scripture history is also taught; and hymns, from a prescribed collection, have to be committed to memory. The master is not allowed to expound the catechism; his duty is to see that the children learn it and understand the words in which it is expressed. It is the clergyman who explains its doctrines to the elder children in preparing them for confirmation.

Any one may open a private school of any class in Prussia who can obtain a license for the purpose from the government; but in a city it must be shown that the district in which the school is to be placed is insufficiently supplied with schools; and every private teacher must have passed the two examinations. Private schools are subject at all times to the inspection of the school-councilor, and are bound strictly to follow the regulations established for private schools. The larger towns in Prussia are not yet adequately supplied with public primary schools; private primary schools are therefore common in such places: in Berlin they educate nearly half the children who are in primary schools.

Of the secondary and higher education in Prussia, a brief and general notice must suffice. It has already been stated that the superintendence of the secondary schools is undertaken by the school-councilor of the province; it is independent of ecclesiastical control. The larger communes and the towns are required to maintain middle schools, giving instruction of a higher order than is given in the elementary schools, a sound German education, and preparing boys for the gymnasia. These must be provided to the satisfaction of the authorities, according to the wants of the population. They are maintained, like the primary schools, by school-fees, local taxation, and these failing, the state treasury. Some of the larger towns maintain also secondary schools of a higher class; these are of two kinds—the real-school, and the gymnasium or grammar-school. In such towns, as stated already, the local management rests with the school-delegacy. There is, besides, a considerable number of real-schools and gymnasia which are entirely in the hands of the government. None of the real-schools take boarders; very few of the gymnasia do so. The gymnasium is a classical school preparing for the universities. In the real-school, mathematics, scientific studies, and modern languages are substituted for the classics, and the instruction is designed to prepare the pupils, as far as possible, for the pursuits of life. The real schools grant certificates to their pupils. The royal real-schools and the gymnasia (other than those maintained by the large towns) are under the management of the provincial school-councilor. Some of the older of those gymnasia have endowments, but the money necessary for their support is contributed by the state. Appointments to the schools are made by the school-councilor; he appoints the teachers, or nominates the leet out of which local authorities have to choose, in all the secondary schools. Teachers for all the schools have to pass two examinations. There are boards of examiners, appointed by the provincial government, which conduct the examinations; these boards also examine the students of the gymnasia, to test their fitness for the university. The university in Prussia is a teaching (or rather a lecturing), as well as an examining body, and grants degrees in four faculties—theology, jurisprudence, medicine, and philosophy. There are seven universities within the territory held by Prussia before the war of 1866; in two of these—Breslau and Bonn—there is a Roman Catholic as well as a Protestant institute of theology. The university affairs are administered by a commissioner appointed by the crown; all their regulations are prescribed, and all the appointments in them made by the state. See UNIVERSITY.

State Education in the United States.

In the United States, the education of the people is out of the sphere of the central government; it ranks among the domestic affairs of the several states, and it is chiefly in the northern states—those from which, before the late war, slavery was excluded—that systematic attempts have been made to promote it. The central government has, however, in more than one instance endeavored to assist education in the states, by providing for it endowments. In the states which contain waste lands, it puts aside, in every newly-surveyed township of six miles square, one sq.m. for the support of schools within the township. The state becomes trustee of this land, or of the price obtained for it, which is usually called the township-fund, and pays over the yearly income to the township when it has been settled. The central government, about 1836, had accumulated in its treasury a considerable balance, the surplus of its income over its expenditure during several years: this it apportioned *pro ratâ* among the states, reserving the right to reclaim it. This right has not been, and is not likely to be exercised; and in most of the Northern states, the income of the "United States deposit-fund" is applied to the support of education. Since 1864, by what is called the "agricultural college act," the central government has made a liberal offer of allotments of land to the states upon certain conditions, for the endowment of one or more institutions in every state, in which—whatever the other instruction may be—special attention shall be given to the

branches of learning related to agriculture and the mechanic arts. Several states are preparing to avail themselves of this offer.

Every one of the United States has its common schools. Before the war, Kentucky, Missouri, and Louisiana had each some kind of school-system; at various points throughout the south, particular towns had established schools, always after the model set in the northern states. The state of Western Virginia passed a school law not long after the conclusion of the war. In the northern states, besides the endowments above described—both of which are possessed by most of the states—every state possesses a school-fund arising from various sources—sale of lands, taxation, penalties, and forfeitures—which is usually vested either in the state legislature or in a board of education. In the majority of the states, the income of this fund is considerable, nor in general is it small. It is usually, but not in all the states, applied solely to the support of public schools, or of the normal schools which help to provide them with teachers. Apart from the influence exercised by means of this fund, the state usually promotes public instruction only by its legislation, by which it requires or enables local bodies to make certain provision for the education of children within their jurisdiction. Everywhere, the law leaves much, and usually the practice leaves everything, to the local bodies; and these come short of, or exceed the legal requirements according to the local interest in education and ability to pay for it. It is through the interest of the municipalities in education that very ample provision is made in the towns; it is through the force of example, and in deference to educational experience, that a certain uniformity of system prevails. There is a close approach to uniformity both in the law and in the practice of the several states; and a description of the system of one state will be approximately true of that of other states. The Massachusetts system is fittest to be selected for description, as being the oldest, the most celebrated, that which on our side of the Atlantic is most identified with the common schools, and perhaps on the whole the most successful. Some of the principal variations from it will be noted.

In 1642—22 years after the landing of the *Mayflower*—the Massachusetts colonists passed a law requiring every citizen, under a penalty of 20s., to teach his children and apprentices, or have them taught, to read perfectly the English language. Five years later, they passed another law, requiring, under penalty, every township containing 50 householders to support a teacher to teach their children to read and write; requiring every township containing 100 householders to maintain a grammar school capable of fitting youths for the university. The present law is different, if not less liberally conceived. The change was made by numerous steps, and was probably forced on by the circumstances of the community. The law, as it now stands in the revised statutes of the state, provides that in every township the inhabitants shall maintain for at least six months in the year a sufficient number of schools for all the children of the township. The teachers are to be of competent ability and of good morals, and they are to teach orthography, reading, writing, English grammar, geography, arithmetic, the history of the United States, and good behavior. Other subjects—algebra, vocal music, drawing, physiology, and hygiene—are to be taught or not at the discretion of the local committee. Every township may, and every township containing 500 householders must, also maintain for ten months in the year a school which shall give instruction in general history, bookkeeping, surveying, geometry, natural philosophy, chemistry, botany, the civil polity of Massachusetts and of the United States, and the Latin language. And in every township containing 4,000 inhabitants, the teacher must be competent to instruct in the Greek and French languages, in astronomy, geology, rhetoric, logic, intellectual and moral sciences, and political economy. Moreover, any township may establish schools for children over 15 years of age, determining the instruction to be given, and appropriate money for their support. The compulsory part of the law is supported by penalties, but it is said that there would be difficulty in enforcing them; at any rate, they are not enforced. It is also provided that every child between 8 and 14 must be sent to school for at least 12 weeks in a year: the penalty for breach of this provision is $20, but the idea of enforcing it seems never to have been entertained; its existence even is not generally known. The law does not permit school fees, or, as they are called in America, rate-bills. There seems to be no fund arising from waste lands in Massachusetts; and the township raises the necessary funds by a tax upon property—the personal property of the inhabitants and the capitalized value of their real property situated within the township. The amount of the rate is by the law left wholly undetermined: it is determined by the householders at their annual meeting. The state endeavors to influence the townships to make a liberal provision by means of the school fund, a share of which is given to every township which has made its returns to the board of education, and has spent not less than at the rate of $1\frac{1}{2}$ per head for all the children of the township. The school-fund contribution is very small—less than 25 cents for every child; but it is said to have an excellent influence upon the rural townships. No doubt, the publication of the returns made to the board of education tends to spur on the backward districts.

The management and control of all the public schools of a township are placed in the hands of a school-committee, consisting of any number divisible by three; the members of this committee hold office for three years, and one-third of them are elected annually at the annual meeting of the township. The committee have the supervision of the schools; and it is among their duties to see that no book calculated to favor the tenets of

any particular sect of Christians shall be used in the schools, and to require the daily reading of some portion of the Bible in the common English version. Any township by its public meeting, or a city by its city-council, may require the committee to appoint a paid superintendent of schools: when this is not done, the members of the committee receive a small allowance for the time during which they are engaged upon the school-affairs. But, moreover, any township may, at a meeting called for the purpose, resolve to divide itself into districts for the support of its schools. If this be done, the township names for each district a "prudential committee," consisting either of one or of three persons, resident within the district, which is charged with providing and keeping in repair the school-house, at the expense of the district, and, if the township so determines, with the duty of selecting and contracting with the teachers. The district determines the amount to be raised by it for the building or repair or furnishing of its school; this is collected by the township collector, and handed over to the district-committee. The school-committee retains its functions of management, except so far as they have been made over to the districts; and hence, there is a double management of the schools, which is found to be attended with inconveniences. The division into districts, too, is said to have led to an unnecessary multiplication of schools in country places: people scheme to have the township so divided that there may be a school in their neighborhood—there are, therefore, more schools than are needed, and more than can be maintained in efficiency. The school-committee—in cities, the school-superintendent—examines the teacher before his appointment, and grants him a certificate, which remains in force for a certain time. There are three classes of certificate—one valid for six months, another for two years, a third for five years. The common schools of a township are open to all children resident therein between five and fifteen years of age: none are to be excluded on account of race, color, or religious opinions; and it has been held that a child unlawfully excluded may recover damages therefor in an action of tort.

In New York, in Pennsylvania, and in most of the western states, large municipal powers are possessed by the county, and the county shares with the township the management of school-affairs. New York has a state superintendent, whose power over the schools is considerable. In that state, it is the school-commissioner of the "assembly district" in which the township lies who divides the township into school-districts; and it is the district which determines the school-tax: the township is almost completely ignored. In New York, Ohio, and Illinois, it is by county officials that teachers are examined and certificated. In the states of Rhode Island and Connecticut "rate-bills"—that is, school-fees—are allowed, but are rarely levied. Several states besides Massachusetts make school-attendance compulsory: in most of the states, there appears to be some provision against "truancy;" but it appears that attempts are not made to enforce the law except occasionally, in the case of homeless, wandering children, who are liable, in lieu of a fine, to be sent to reformatory schools. It has been calculated that in the city of New York (pop. 1,515,301) there are about 108,000 children who do not go to school—though in no city is there a better or ampler provision of common schools.

In general, it may be said that in spite of the insufficient pay of the teachers, the work is surprisingly well done. The great increase in the number of normal schools and of special colleges for the scientific training of teachers in the principles of pædagogy, and a more general tendency among those who teach to regard their work as a profession and not as a temporary makeshift, have given the country a remarkably intelligent and capable body of instructors who discharge the important function of training the young, with zeal and ability. The old type of country teacher who "boarded round" and looked upon his occupation as a disagreeable necessity, is now practically extinct. All our states have come to attach a proper importance to the duties of examination and school superintendence. In Massachusetts the importance of competent supervision of the schools has been so generally acknowledged that twenty-eight towns and all but two cities in the State have for years employed a superintendent of schools, but in the smaller towns there has been no supervision except that given by the occasional visits of the school committees. The teaching is wonderfully good, considering the scanty pay given; but where the vacations last for more than six months, and the teacher is changed almost every term, thorough and systematic instruction is scarcely possible. It is in the towns that the working of the school-law has been creditable and successful. Through the high public spirit of the municipal bodies, and the great importance attached to education, the support of the common schools is in general most liberally provided for.

In the towns, there is usually a superintendent of schools, by whom, under and in co-operation with the general and district school-committees, the schools are inspected, and the character of the instruction determined; by him the examination of the teachers also is conducted. Of the schools, there are four classes—primary, intermediate, grammar, and high-schools or academies. Children usually enter the primary school about 5 or 6; the grammar-school between 8 and 9; the high-school between 12 and 13 years of age. They are not promoted from one class of school to another without undergoing an examination; the intermediate schools, where they exist, are intended for those who are too old to be at the primary school, and too backward to enter the grammar-school. To be admitted to a grammar-school, a child must be able to read at first sight easy prose, to spell

common words of not more than three syllables, and to have acquired a slight knowledge of arithmetic. For admission to the high-school, the usual requirements are ability to read correctly and fluently, an acquaintance with the simple rules of arithmetic, and some knowledge of geography and grammar. From these tests may be inferred the average proficiency expected to be attained by children leaving the primary and the grammar-school respectively. In the grammar-schools of Boston, the programme of studies consists of spelling, reading, writing, arithmetic with book-keeping, geography, English grammar, the history of the United States, natural philosophy, drawing, and vocal music: this is nearly the usual programme; but in New York and one or two other states a little more is attempted. Between the high-schools or academies in the various states, there are considerable differences. But, in general, the high-schools are simply schools of secondary instruction, intended to prepare youths for the university—instruction being given in the classical languages, mathematics, the sciences, history, and the English language and English literature. The usual curriculum is one of four years; and the students are not required to study all the subjects taught in the school. At Boston, where boys are admissible to the Latin high-school at 10 years of age, the curriculum lasts for six years. There are high-schools for girls as well as for boys, the programme of instruction being the same in both. At Boston, the curriculum at the girls' high-school lasts for three years; and pupils at admission must be between 15 and 19 years of age. Boston possesses, besides its Latin high-school and its girls' high-school, an English high-school, said to be admirably planned and conducted. The instruction in it closely resembles that given in the real-schools of Germany, including French and German, and various sciences, with their application; being intended to enable boys to complete a sound English education, and to prepare themselves for commercial life. Great complaints are almost everywhere made– Boston seems to be exceptional in this respect—of the irregularity of the attendance at the primary schools. It is estimated that in most states not much more than half of the children pass from these to the grammar-schools; but a trifling proportion of the grammar-school pupils enter the high-schools, and of these, only a small fraction persist to the end of the curriculum. All high-schools grant certificates of graduation to pupils who have creditably gone through the course of study. The study of the classics does not, even in the most pretentious institutions of this class, seem to be carried very far, much more attention being given to mathematics and natural science. In Boston—in many respects the most favorable example that could be taken—there were, in 1888, 72,590 children of school-age—between 5 and 15; of these, 65,782 were in school, the average attendance being 51,692. The number enrolled at the eleven high schools, 1888, was 2824; at private and parochial schools, 7882. Among the wealthy, there is said to be a growing disinclination to make use of the common schools; their children are usually sent to private academies. The only serious opposition to the non-religious character of the common schools comes from the Roman Catholic clergy; but it is stated that there is a growing feeling upon this subject among some of the other religious bodies. See COMMON SCHOOLS; EDUCATION; GYMNASIA; KINDERGARTEN; MANUAL TRAINING.

NATIONAL GUARD, an organization for local defense, differing from the American militia and volunteers, in being at the disposal of the municipalities, not of the state. Italy, Greece, and other nations have maintained this civic force; but the country whence it derives historic fame is France. The French national guard was instituted in Paris in 1789, when the government had an army of 30,000 at the gates. The municipality armed 48,000 men, and their example was followed by the chief towns of France. These corps obtained the name of national guard and assumed the famous tricolor as their ensign. In 1795, 30,000 of the Paris national guards attacked the Tuileries, and were repulsed by Napoleon Bonaparte with 6,000 regular troops. In 1830 they were reorganized under the command of Lafayette, their original chief; and between 1848 and 1851 a law was passed by which all males above 20 not otherwise employed under government were included in the national guard. After the *coup d'état* in December, 1851, they were reduced to the condition of an armed police. In the war of 1870–71 they showed some signs of vitality in sympathy with the commune, but effected nothing for France. After the fall of the commune they were disbanded. The term National Guard is applied in some of the United States to the volunteer militia. See MILITIA.

NATIONAL HYMNS. More attention is now given to the study of national music than formerly. Until a comparatively recent date it was almost disregarded. In the preface to his *History of Music* (London 1776) Sir John Hawkins says: "The best music of barbarians is said to be hideous and astonishing sounds. Of what importance, then, can it be to inquire into a practice that has not its foundation in science or system, or to know what are the sounds that most delight a Hottentot, a wild American, or even a more refined Chinese?" National music usually possesses characteristic peculiarities in rhythm, modulation, and melody, of which the cultured musician may avail himself to produce new and striking effects, and by his knowledge of the various musical scales and construction and combination of musical instruments employed in foreign countries may trace interesting resemblances between several nations. The great composers have been fully conscious of the importance of national music, and many instances of imitations of national tunes or of works in which the local melodies are inserted without alteration will arise. Among these may be mentioned the *Pastoral Symphony* in Handel's *Messiah*,

which owes its origin to the song of the Italian *Pifferari*—Calabrian peasants who sang melodies before the shrine of the Virgin Mary in the streets of Rome at Christmas, and which Handel heard while visiting that city. Mendelssohn's *Scotch* and *Italian* symphonies contain many local melodies, which he noted while traveling. Among other modern composers Chopin colors his works with the romantic character of the Poles; Liszt and Brahms weave over the national melodies of Hungary, with their peculiar Magyar rhythms and gypsy tunes; Rubinstein, Tschaicowsky, and Moscowski introduce Russian airs and Sclavic turbulence into their compositions; Dvorák treats the Bohemian song and dance tunes with all the resource of modern technique and knowledge of intricate harmony; and Grieg works in brilliant style, combining the weird Norwegian melodies, harmonies, and rhythms in the most romantic and unique manner, and with modulations and orchestral tone-color second to none but Wagner. Especially in their songs do the people express their truest feelings and sentiments, and national character is most distinctly revealed in this branch of composition. The national and popular songs include the *Volkslieder* of Germany, the *Canti populari* of Italy, the *Ballads* of England, and the *Chansons* of France. The temperament of the French has always been favorable to the production of political songs. See *Chanson*. The *Mazarinade* of the 17th century was a collection of over 4000 satirical songs adapted to popular airs, and directed against the Cardinal Mazarin. Early in the 18th century famous songs were written, such as *La Marseillaise; Malbrook s'en va t'en guerre; Ça ira; Richard ô mon roi; Où peut on être mieux qu' au sein de sa famille; Chant du départ; Chant du retour; Chant du Victoire; Mourir pour la Patrie; Partant pour la Syrie; La Parisienne; Reveil du peuple*, by Souriquère de Saint Marc, set by Gaveaux, and called the *Marseillaise of the Thermidor reaction;* and *Père de l'univers*, by Desorgues, and set by Gossec. Contemporary with them but of less political importance are the songs of the class, which include: *Cadet Rousselle; Chanson du Roi Dagobert;* and *Fanfan la Tulipe*, the latter set to an old tune being extremely popular in 1792–1802. In Spain and Portugal the song has but a meagre history. Remains of troubadour poetry and music still exist, but the favorite airs are dance tunes, popular songs, and serenades sung to the accompaniment of the guitar—the national instrument. Scandinavian songs deal largely with ballads, legends, and tales of old heroes, the heroic element being more of a favorite than the lyrical. Many collections of these epic songs have been made, and these with the herdsmen's songs are the most distinctly national. The herdsman or a Scandinavian maiden calls the cattle home from the mountain pasture by a song, or sometimes a melody blown upon the cow-horn called *Lur*. This practice is similar to the *Ranz des Vaches* (q.v.) played upon the Alpine-horn in Switzerland, which is a national feature. The songs of Hungary are a combination of the Magyar and Gypsy elements. The introduction of Christianity in Hungary was followed by a burst of hymn-poetry, and some of these venerable compositions are still sung; some are written in honor of the Virgin, others to the praise of King Stephen, the patron saint of Hungary. The excitable and sensitive temperament of the Hungarians has made them cultivate music with great devotion, but their exclusiveness for many years kept their music in comparative obscurity. Liszt, Joachim, and Brahms owe much of their fame to the national element which speaks through their compositions. The national air of Hungary is the *Rákóczy March* (q.v.). The love of the Russian peasant for his national airs is shared by the educated classes, and the operas on national subjects of Verstovsky, Glinka, and Tschaicowsky have a wide and enduring popularity. Russian songs are distinctly local. Great Russia, Little Russia, the Wendic branch of the Sclavic race, and Servia have their separate and characteristic folk-songs. The Russian National Hymn, composed by Alexis Lvoff in 1833, possesses none of the characteristics of Russian music, but resembles the *Sicilian Mariners' Hymn, O sanctissima* (a hymn to the Virgin Mary, still sung in Venice). Immediately on its appearance the Emperor of Russia ordered it to be performed in concerts and in the theatres. Rubinstein introduced it into his *La Russie*, a symphonic poem for orchestra, illustrative of Russian national airs. The songs of Poland differ from those of Russia in having more romance and fire, and an instrumental rather than vocal coloring. In their rhythms and syncopated notes they resemble the Hungarian music more than the Russian. Of modern Polish songs, those of Chopin are the best known. There are numerous collections of Bohemian national songs which of late years have been brought into public notice by the works of Smetana and Dvorák. They are purely local in color and form. The popular songs of Italy are chiefly street songs and *barcaroles*, which are sung by the gondoliers in Venice. The history of the German *Lied* (q.v.) is almost the history of the heart of the nation. From the time of the Meistersinger and Minnesinger the Volkslied has lived on the lips of the people. The most distinctly national airs are the Austrian hymn, by Haydn, entitled *Gott erhalte Franz den Kaiser* (q.v.) and *Die Wacht am Rhein* (q.v.). The names of Hans Sachs, Martin Luther, Bach, Mendelssohn, Schubert, Schumann, and Robert Franz call to mind hundreds of Volkslieder, chorales, and lyrics that may, in fact, be considered national, so universally are they known and sung. Turning to England, we find *God save the King* (q.v.) and *Rule Britannia*, the two chief patriotic songs, while ballads and popular songs, with their simple melodies, are too numerous to catalogue. Among these may be mentioned: *The Roast Beef of Old England; Sally in our Alley; Black-eyed Susan; Wapping Old*

Stairs; Tom Bowling; The Jolly Young Waterman; Ye Mariners of England; The Bay of Biscay, and *Cherry Ripe.* The songs of Scotland have always been held in great esteem. They are always based on simple airs and dance tunes, many of which are characterized by the peculiar Scotch snap—a name given to effect produced by a short note preceding a long dotted note. The melodies of the Lowlands differ from those of the Highlands; but the distinguishing quality of both is their plaintive and melancholy tone. This is partly due to the national scale within which every air (with a few exceptions) is written. It is the modern diatonic scale, deprived of the fourth and seventh notes. The following are national favorites though not patriotic songs: *Annie Laurie; Comin' through the Rye; John Anderson my Jo; Auld Robin Gray; Auld Lang Syne; The Birks of Aberfeldy; The Blue Bells of Scotland; Bonnie Doon; Bonnie Dundee; The Campbells are Comin'; Caller' Herrin'; Jock o' Hazeldean,* and *The Gaberlunzie Man,* and all the songs of Robert Burns. The close resemblance of Irish and Scottish airs has led to confusion, and many Irish tunes have been claimed by Scotland. Among the popular Irish songs are: *The Groves of Blarney,* to which Moore wrote his *Last Rose of Summer,* inserted in Flotow's opera of *Martha; Rory o' More; Aileen Aroon,* to which tune the words "Robin Adair," and also "Erin the tear and the smile in thine eye" are sung; *Saint Patrick's Day; Limerick's Lamentations,* and the numerous songs by Thomas Moore, written to ancient Irish melodies, including: *Believe me if all those endearing young Charms; Oft in the Stilly Night; Those Evening Bells; Let Erin Remember; Araby's Daughter,* and *The Harp that once through Tara's Halls.* The distinctively national songs of America are *Hail Columbia; The Star-Spangled Banner* (q.v.), and *Yankee Doodle* (q.v.). *Hail Columbia* was written by Joseph Hopkinson (q.v.) in 1798, when a war with France was thought to be inevitable. The music of *Hail Columbia* went by the name of *General Washington's March* and afterwards *The President's March.* It was played in 1789, when Washington was inaugurated in New York. Another national song, *My Country, 'tis of thee,* written by Samuel Francis Smith in 1831–2 to the tune of *America,* has always been popular. *Maryland, my Maryland,* written by James Ryder Randall in 1861, to the German Burschenlied *O Tannenbaum, O Tannenbaum,* and *Dixie,* by Gen. Albert Pike, to music by Dan Emmett, of Bryant's minstrels, about 1860, are the most popular of the Southern war-songs. During the civil war the troops were accustomed to march to the music of *Annie Laurie; Rosa Lee; Lilly Dale; Marching Along; Home Sweet Home; The Girl I left behind me; John Brown's Body; Rally Round the Flag, Boys; Tramp, Tramp, Tramp, the Boys are Marching; Yankee Doodle; Hail Columbia,* and *The Star-Spangled Banner.* Another song endeared to the hearts of American people is *Home Sweet Home,* written by John Howard Payne (q.v.). See CHANSON, LIED, SONG; Gagneur, *Chansons populaires du Canada* (Quebec, 1865); Nisard, *Des Chansons populaires* (Paris, 1867); Verrimst, *Rondes et chansons populaires* (Paris, 1876); Du Mersan, *Chants et chansons populaires de France* (3 vols., Paris, 1848); Champfleury et Wekerlin, *Chansons populaires des provinces de France* (Paris, 1860); Reissmann, *Geschichte des deutschen Liedes* (2d ed., 1881). Nason, *Our National Song* (Albany, 1869); Helen Kendrick Johnson, *Our Familiar Songs,* etc. (New York, 1881); and Sousa, *National and Patriotic Airs* (New York, 1890).

NATIONAL MUSEUM. See WASHINGTON.

NATIONAL NICKNAMES. Nicknames are as ancient as the most venerable histories. Even the divinities of old were distinguished by such additions, and kings, queens, all great men, captains, divines, and statesmen have received from malice, revenge, derision, humor, or habit, nicknames which will cling to them to the end of time. The origin of the word is somewhat obscure. It has been referred to the French *nom de nique,* the German *nicht name,* and the Old English *eke* name, corrupted into *neke name,* an additional name, an *ag-nomen,* from which it is probably derived.

National peculiarities have not escaped, and we find the people of almost every country on the globe known by some collective title. By the familiar name of JOHN BULL we are accustomed to understand the English nation taken as a whole, and the nickname immediately recalls the figure of a sturdy, corpulent old fellow, with a three-cornered hat, red waistcoat, leather breeches, and a stout oaken cudgel. By it we are reminded of the peculiarities of the nation from a laughable point of view: corpulent, beef-eating; red waistcoat, defying; cudgel, defending himself. The name was first used in the satire of Arbuthnot, *The History of John Bull,* usually published with Jonathan Swift's (q.v.) works; and, later, by Max O'Rell (q.v.), in his *John Bull and His Island.* Washington Irving says that the English seem to have taken a singular delight in exhibiting their most private foibles in a facetious manner, and have been so successful in their delineation, that there is scarcely a being in actual existence more absolutely present to the public mind than that eccentric personage, John Bull. He always puts himself at his ease, nothing astonishes him, nothing daunts him; he is fiery, brave, calm, past-master of diplomacy. UNCLE SAM is so familiar to the national ears of Americans and to the world in general as the comprehensive nickname of the United States government, that very few stop to consider its origin. During the last war with England, in 1812, when large quantities of provisions were required for the consumption of the army, the contractor, Mr. Elbert Anderson, of New York, collected and stored an immense amount of beef, pork, grain, etc., in the city of Troy, on the Hudson River. The

inspectors appointed at this place, to receive the goods, were Ebenezer and Samuel Wilson. The latter, who was invariably addressed and spoken of as Uncle Sam, usually gave his personal attention to the workmen who overhauled these provisions. A practical joker, employed by the Messrs. Wilson to mark the casks, was asked one day by some of his companions the meaning of the letters "E. A. U. S." placed upon the casks. As the abbreviation U. S. for the United States was then comparatively unknown, he instantly replied, that it must be for Elbert Anderson and Uncle Sam, alluding, of course, exclusively to Uncle Sam Wilson, their employer. The joke was passed around among the workmen, and Uncle Sam was rallied upon his increasing importance. When the recruiting sergeant made up his lists, many of these men found their way into the army, and were pushed to the front to meet the enemy. As they mingled with their comrades from other parts of the country, their casks of provisions and their jokes went with them. It was not long before this identical joke appeared in print, and as it took with the army, it was soon circulated all over the United States, and Uncle Sam became one of the national nicknames, and will undoubtedly remain so as long as this is a free country. BROTHER JONATHAN is the typical name facetiously given to the people of the United States. Its origination was purely local, but it was with the great Washington himself. When placed at the head of an army which had to be organized and provided with food, ammunition, and supplies of all kinds, in order to enable him to meet the powerful foe arrayed against him, he was often very much depressed. While in Connecticut, arranging that division of his army, he found himself in a hopeless condition, and almost in despair he called a council of his officers, thereby hoping to devise some plan for his relief. His Excellency, Jonathan Trumbull, was then governor of the state, and in him Washington reposed much confidence, not only in his ability to aid, but also in his judgment. On this trying occasion he finally remarked, "Well, we must consult Brother Jonathan on the subject," referring to Governor Trumbull. He did so, and received the needed assistance. When the army spread over the country, the expression, "We must consult Brother Jonathan," went with it, and soon the connection was lost sight of, but the nickname, "Brother Jonathan," remained. He is represented as a tall, raw-boned rustic, with red-and-white-striped trousers, much too short for him, strapped tightly down, a blue, short-waisted coat with brass buttons, sharp-featured, his long hair flying in the wind, and on his head an old-fashioned beaver hat. NICHOLAS FROG, the typical Dutchman, is not in the least like his neighbor, John Bull. This nickname was also first used by Arbuthnot in his satire, *The History of John Bull*, and he is represented as frugal-minded in his domestic affairs, sly, always ready to pinch his appetite to save his pocket, never losing a farthing by careless servants or bad debts. He does not care much for any diversions except legerdemain and German tricks, but is a fair dealer, and in that way acquires immense riches. JOHNNY CRAPAUD is the popular nickname of the French nation, collectively taken, and dates back to the time when the ancient kings of France used for their device in heraldry, "three toads erect, saltant," or in a leaping posture, and Paris was called *Lutetia*, or mudland. Its streets were so quaggy that the French court, with a point to its pleasantry, called its inhabitants "frogs," since they, like the reptiles, lived in mud. Hence the common, flippant expression among the court swells at Versailles in 1791, "*Qu'en disent les grenouilles?*" "What will the frogs say to that?" Nostradamus, in the sixteenth century, predicted the capture of a city by the toads of France in the following line: "*Les anciens crapauds prendront Sara,*" "The old toads will take Sara," or, spelled backward, Aras, which city they took from the Spanish in the time of Louis XIV. ROBERT MACAIRE, a favorite name in French plays, is often used generically for a Frenchman, because of its popularity. For the French Canadian, we have JEAN BAPTISTE, and the French peasant is facetiously called JACQUES BONHOMME. This name was given them by the French barons in the fourteenth century, and the insurrection known as the "Jacquerie" derived its name from the fact that the English thought it was instigated by John Goodman, which is the translation of Jacques Bonhomme. COUSIN MICHAEL is the facetious nickname applied to the German people and intended particularly to satirize the weaknesses and foibles of the national character, especially their proverbial lethargy, heaviness, and credulity. The name Michael is often used to designate any simple, uncultured countryman, and it has probably gained this significance by confusing the Hebrew word with the old German *Michel*, gross. SAWNEY is the sportive designation applied by the English to the Scotch, and is probably a corruption of Sandy, the abbreviation of Alexander. Sawney has a humor of his own, strong and irrepressible, that will break out in spite of worldly thrift, kirk-session, cutty-stool, and lectures. It was first given to the Scotch by Coleridge. TAFFY, the Welshman, is a corruption of David, one of the most common of Welsh names. COLIN TAMPON is the reproachful, contemptuous sobriquet given to the Swiss in ancient times, supposed to imitate the sound of their guns. PADDY can refer only to the good-natured, rollicking Irishman, witty and thriftless. JOHN CHINAMAN is the popular nickname for the Chinese, and the first record of its use was in "*A Letter to the Committee of Management of Drury Lane Theatre, London, in* 1819." SAMBO or CUFFY is the common name for the Negro, sometimes written CUDDY and applied to slaves, who are used like asses or donkeys. The Russian nickname, IVAN IVANOVITCH, denotes the typical *Moujik*.

NATIONAL PARKS, a term applied to certain territory in the United States, set aside by act of congress and specifically exempted from sale, being reserved, by reason of picturesque character and general natural features, as common to the entire people, except for settlement or private use. Up to the present time the principal tracts of land thus appropriated are the Yosemite valley and the Yellowstone region; the former of which was made a national park by act of congress passed June 30, 1864, and ordered to include the Mariposa Big Tree grove; the Yellowstone Park was set aside by act approved Mar. 1, 1872.—The wonders of the Yellowstone region were first made known to the world through the report of a government reconnoissance, or exploration of the Yellowstone river and the surrounding country, made by officers of the U. S. corps of engineers, under the orders of Lieut.-Gen. Sheridan, in 1871. This region, long known as the "Great Divide," is comprised in the states of Montana and Wyoming, being the geographical centre of North America. The area covered by the reservation measures about 4480 sq. miles. Generally speaking, it lies between 110° and 111° w. long. and from 44° to 45° n. lat., the general elevation being about 6000 ft. above the level of the sea, though mountain ranges on every side rise to a height of 10,000 to 12,000 feet. Four routes lead to the Yellowstone National Park: 1, from Corinne, on the Central Pacific railroad, to Fort Ellis, thence 30 m. to the Yellowstone river; 2, by way of the upper Missouri; 3, from the Canadas and the great lakes to Duluth, and thence by the Northern Pacific railroad; and, 4, from Walla-Walla, on the west. The most convenient and practicable route has hitherto been that from Corinne to Virginia City, Montana; thence to Fort Ellis, crossing the Madison river, one of the head-waters of the Missouri; and to the Gallatin valley, which is about 40 m. in length and 10 to 15 broad, the finest agricultural land in Montana, at the upper end of which is Bozeman, and 3 m. beyond Fort Ellis. From this point the trail leads to a Crow agency, about 30 m. distant; and thence by a course nearly due s., following that of the Yellowstone river, to the great falls of the Yellowstone. The whole of this route, after reaching the river, offers some of the most impressive and sublime scenery in the world. Picturesque masses of rock, tall columns of basalt, and a landscape generally volcanic in character, present the most prominent features of the trail; chief among which is the "Devil's Slide," an extraordinary vertical rock formation, projecting a thousand feet into the air. Proceeding up the valley, Gardner's river, or Warm Stream creek, is met, as it enters the valley and joins the Yellowstone 15 m. from the middle cañon. Here begins the hot springs district, with the largest spring in the country, consisting of a basin 40 ft. long by 25 wide, through three openings, in which great quantities of carbonic acid gas are discharged. In this spring, which offers water of different degrees of temperature, in smaller basins and terraces, are found the most fantastic deposits of stalactites and stalagmites; while the basins are gracefully curved and scalloped, and vary in color from a rich yellow to a vivid red, offering a most brilliant and beautiful effect. Leaving this point, the "low divide" is crossed between the valley of Gardner's river and that of the Yellowstone, and the precipitous entrance to the great cañon is reached, so gloomy and forbidding in aspect that it is named the "Devil's Den." Through this narrow gorge the river rushes with great velocity, until it shoots over the abrupt descent of a fall of about 150 ft., and, after a series of rapids and cascades, finally leaves the great cañon with a single leap of 350 ft., after which its course lies over a rolling prairie for several miles. The great cañon has never been explored, but the height of its sides is known to be more than 2,000 feet. A new hot spring region is now reached, remarkable for its "mud geysers," and particularly for a mud volcano, having a crater 25 ft. in width and 30 ft. in depth, and in a constant state of ebullition. One of the geysers having a basin 60 ft. in diameter, spouts at regular intervals of six hours. Eight m. from these geysers is Yellowstone lake, more than 7,000 ft. above the sea-level, 30 m. in length, 15 m. broad, and from 1½ to 50 fathoms deep, with a shore line measuring more than 300 miles. Almost in contact with this remarkable body of water is a chain of hot springs; fish abound in the lake, game of all kinds is found in the surrounding forests, and there are facilities for boating, and rude accommodations for the tourist. Striking westward, the traveler now journeys toward the head-waters of the Madison river. The country, though impressed with volcanic characteristics, is here diversified by dense tracts of forest; and about 10 m. from the Yellowstone a new system of hot springs is reached, the whole district presenting the appearance of a vast limekiln in active combustion. Shortly after reaching the crest of the divide between the Yellowstone and the Madison, a valley is entered in which the springs are strongly impregnated with sulphur. In what is known as the Firehole valley—that of the Firehole river, the main eastern fork of the Madison—are large numbers of beautiful springs. But the object of greatest interest to the tourist is the great geyser basin, which is entered from the north, following the course of the Madison river. The geysers are all named, the first seen being two which are very active, placed one on each side of the river, and known as the "Sentinels." Next is the "Well" geyser, which has a crater formed like a well, and which spouts to a height of 80 or 90 feet. An extraordinary formation, 8 ft. high and 90 in circumference, is called the "Grotto;" it is hollowed into arches, and plays to the height of 60 ft. several times in every 24 hours. The "Giant" geyser is considered one of the most remarkable in the group. It has a crater 5 ft. in diameter, and its highest point is 15 ft. above the mound on which it stands. It throws a column of water the size of the opening, to

the measured height of 130 ft. continuing each active period for an hour and a half. From this system of geysers, a journey of about 12 m. reaches "Castle" geyser, which is situated on a platform of deposit, measuring 100 ft. in length and 70 in breadth. From the center of this platform rises a chimney 12 ft. high, 120 ft. in diameter at the base, and 60 ft. at the top, with a three-foot aperture. This monster geyser, when in operation, sends a column of water to a height of 250 ft., the movement being not continuous, but pulsating, at the rate of about 70 throbs to the minute, the time of activity being about an hour. At the head of the valley stands the geyser known as "Old Faithful," so called because it plays with great regularity every three-quarters of an hour, throwing a stream 100 to 150 ft. in height. From the mound of this geyser can be seen the best presentment of the basin. The entire valley is drained of its hot water by the Firehole river, which takes it into the Madison. The geysers visible from this point are severally named the "Bee-hive," the "Giantess," "Grand," "Young Faithful," "Fan," "Riverside," "Saw-mill," "Turban," etc. The Firehole river is itself one of the most remarkable features of this region. Its bed and banks, entirely composed of hot-spring deposit, are honeycombed and scooped out by geyser springs and pools, varying between minute vents not bigger than a quill and great tanks of boiling water. The course of the river is very straight, and resembles that of a canal through a country of limekilns covered with slag-heaps and refuse of old smelting-works. The borders of this stream, and of its confluent, Iron Spring creek, are dotted in all directions with mud ponds, warm pools, boiling springs, and the remains of ancient geysers. The Yellowstone region has been only visited by tourists, and the therapeutic qualities of its springs have not been analyzed. The writer of the government report said of the country in question: "No other locality, I think, can be found which combines so many attractions, both of climate and scenery." The act of congress by which the Yellowstone country was reserved as a national park, stated that it was "reserved and withdrawn from settlement, occupancy, or sale, under the laws of the United States, and dedicated and set apart as a public park or pleasuring ground, for the benefit and enjoyment of the people," while by the same act it was placed under the exclusive control of the secretary of the interior. The park was enlarged on the south and east by act of congress, 1890. During the summer months the atmosphere is pure and invigorating, with an entire absence of storms. The number of springs is from 5000 to 10,000, and there are at least 50 geysers. The temperature of the springs ranges between 160° and 200°.

The Yosemite valley was granted by congress to the state of California, conditionally on the district being forever set aside as a place of public resort and recreation. It is in Mariposa co., California, about 155 m. from San Francisco, nearly in the center of the state. It is nearly level, and is 6 m. long, and varying between one-half a mile and a mile in width; and its perpendicular depth below the surrounding level is about one mile, although it is elevated above the sea level almost 4,000 feet. Its walls are nearly vertical, and through it winds the Merced river, its general direction being n.e. by e., and s.w. by w., nearly at right angles with the general direction of the mountain ranges. The valley is accessible by stage and saddle-horse from points on the Central Pacific railroad, about 90 m. distant, but only in summer: in winter it can only be reached on snow-shoes. There are hotels for the accommodation of tourists, and these are comfortable and well supplied. Numerous objects of interest occur in proceeding up the valley, the first being the Bridal Veil fall, which is formed by the precipitous leap of a creek of the same name over a descent of 630 ft., to a slope below, from which point a series of cascades extend to the valley, the entire fall being more than 900 feet. Cathedral rock, a massive granite formation, 2,660 ft. in height, is met a little above the fall; and a short distance beyond this, the "Spires," single columns of granite, 500 ft. in height, stand out from the main walls of the valley. Sentinel rock is 3,043 ft. high, its termination being a slender obelisk 1000 ft. in height. Sentinel dome and the Virgin's Tears fall are the next important features; the latter being a cataract falling more than 1000 feet. El Capitan and the Three Brothers are monster masses of rock; and, above the latter, is the great Yosemite fall, which has first a vertical descent of 1500 ft., then a series of cascades falling 626 ft., and a final plunge of 400 ft.—the whole appearing to the observer to be a continuous fall, whose effect is grand and imposing in the extreme. During Aug. and Sept. the Yosemite and Bridal Veil falls nearly disappear, the best time for seeing them being in May, June, or July, before the creeks which form them are dried up. In 1889 an extensive area encircling the Yosemite valley was added to the reservation.

About 16 m. s. of the Yosemite valley are the Mariposa groves of "big trees," one of a number of groups or collections of the *sequoia gigantea*, only found in California; and the *sequoia semper virens*, or red wood. Three of these groves are in Mariposa co., and include 134 trees more than 15 ft. in diameter, and 300 of smaller size. In all the groups there are trees from 275 to 375 ft. in height, and 25 to 35 ft. in diameter, well proportioned; the age of some that have been cut down have been estimated, by the usual methods, at from 2000 to 2500 years. In 1890 three sections of land near Visalia, Tolure co., containing giant trees, were reserved for a national park, and in the same year the battle-ground of Chickamauga, in Tennessee, was set apart for similar purposes.

NATIONAL PARTY, NATIONALISTS, AND NATIONALISM, are terms respectively used to describe the organization, the members and the doctrine of an association in the United States and elsewhere, devoted to realizing in fundamentals, though not necessarily as to details, the plan of industrial reorganization described in Edward Bellamy's romance, "Looking Backward," published in 1888. The origin of the Nationalists as an organization dates from December of that year, when the first Nationalist club of Boston was formed by readers of the book mentioned, who believed in the practicability and desirability of the system set forth in it. At the present writing, Oct., 1890, there are in the United States over one hundred and fifty fully organized clubs in correspondence, with an indefinite number of more or less closely affiliated organizations. *The Nationalist*, a monthly magazine founded in May, 1889, and published in Boston, is the official organ of the party, besides which there are two Nationalist weekly papers in California. In addition to these organs it is estimated that some thirty or forty newspapers in various parts of the United States are engaged in the advocacy of Nationalist principles. Owing to the novelty to the mass of the American people of these principles, the leaders of the movement have recognized the necessity of an extensive educational campaign as preliminary to effective political action, and to this work the efforts of the Nationalist organizations have hitherto been chiefly directed. In a number of instances the Nationalist party has, however, already appeared in the political field. In Massachusetts a state league of clubs has been formed and the organization has circulated petitions and appeared before the Legislatures in advocacy of several Nationalist measures. In California a state Nationalist convention was held in the spring of 1890, and two Nationalist congressional candidates were nominated for the fall election. In New York city and various other places, political action has also been taken by local organizations.

The principles of Nationalism have excited much sympathy in Europe, especially in Great Britain, Germany, and the Scandinavian countries, and also in the British colonies of Australia and New Zealand and the Dominion of Canada. From the latter country Nationalist associations are reported. The first regular organization in England was formed in London, July 3, 1890, under the name of "The Nationalization Society," and is establishing branch societies in the English cities. An organ of the English agitation, called *The Nationalization News*, has appeared.

Briefly stated, the object of Nationalism is to establish in place of the present methods of competitive industry, which are claimed to be as wasteful economically as they are morally unsatisfactory, a complete co-operative organization of industry on a national basis, that is to say, a national business partnership, in which all citizens shall be equal partners, that is to say, a true industrial republic. The doctrine is called Nationalism both on account of its principles and its methods. It is claimed that the essential idea of the nation as an organization of men for the more effectual promotion of their welfare, logically implies the organization of their industries, as at once their most vital interest and the one most to be benefited by combined action. It is, therefore, held self-evident that so long as a nation lacks a national organization of its industries, it fails to be a complete nation, and is imperfectly evolved. It is proposed by Nationalists to apply the principle of Nationalism by the method of progressively nationalizing the public services and industries of the country. It is believed that in time the transformation may thus be completed without serious derangement of business or great individual hardship. It is proposed in the United States to begin by nationalizing the telegraph, telephone, railroad and express businesses, as well as the business of coal-mining, and by the municipalizing of the heating, lighting, transit, and other public services of towns. It is proposed to organize all employés of nationalized or municipalized services on a basis of guaranteed rights as to admission, employment, promotion, discharge, and pensions, which shall render them at all stages and in all relations wholly independent of political patronage or control. It is proposed to establish a national distributive and productive system for the supply of public employés as soon as they shall become numerous, and thus by logical and obvious steps to proceed to the completion of the national co-operative fabric, with its requirement of service from all and its guarantee of maintenance to all. The Declaration of Principles of the parent Nationalist Club of Boston, which has been adopted by all the other organizations, contains the following expressions from which the spirit and temper of the movement as a whole may be well inferred: "We advocate no sudden or ill-considered changes; we make no war upon individuals; we do not censure those who have accumulated immense fortunes simply by carrying to a logical end the false principle on which business is now based.

The combinations, trusts, and syndicates, of which the people at present complain, demonstrate the practicability of our basic principle of association. We merely seek to push this principle a little further, and have all industries operated in the interest of all by the nation—the people organized—the organic unity of the whole people.

The present industrial system proves itself wrong by the immense wrongs it produces; it proves itself absurd by the immense waste of energy and material which is admitted to be its concomitant. Against this system we raise our protest. For the abolition of the slavery it has wrought, and would perpetuate, we pledge our best efforts."

NATIONAL STANDARDS and **EMBLEMS.** Standards, or emblems, are adopted by various nations, owing to some peculiarity of political policy, warlike daring, personal bravery, or religious veneration. Whatever the emblem of any nation may be, it is intended to be a symbol of power, or strength; the divine idea of duty; of heroic daring; of freedom; of right. In both peace and war, it is importunately pre-eminent; it is the object of respectful salutation, and it is the vehicle of deadly insult.

The invention of standards is attributed by ancient authors to the Egyptians, as they were probably the earliest organized military force of which we have any knowledge. On the oldest bas-reliefs on Egyptian monuments are representations of standards, and they were regarded with such a degree of awe that sacred rites were performed to them. In the time of the Pharaohs, each regiment, and often each company, had its own symbolic devices. Birds, the ibis in particular; beasts, reptiles, and, later, a combination representing the sun, moon, and other heavenly bodies, were employed. This latter was arranged in the form of a semicircle, and was an object of superstitious veneration, calculated to awaken in the minds of the soldiery that degree of enthusiasm indispensable to success in warfare.

The standard-bearer was usually an officer, a man of approved valor, and distinguished by a peculiar badge suspended from his neck, consisting of the representations of two lions, the emblems of courage.

Among the ancient Hebrews, after the Exodus from Egypt, in the march through the wilderness, each of the four great divisions into which the tribes of Israel were divided, had its governing standard; and tradition has assigned to them the respective forms of the symbolic cherubim seen in the vision of Ezekiel, and, later, of St. John: that of Judah being the lion; of Reuben, a man; of Ephraim, a bull; and that of Dan, an eagle.

The ancient Assyrians had on their ensigns the figure of a man drawing a bow, while standing on the back of a bull rampant. Eagles are also frequently represented in Assyrian sculptures attending the soldiers in battle, and some writers have supposed them to have been trained birds. Their wild and intractable nature renders this improbable, although instances are known, even in late wars, of captive eagles going with their regiments, and when let loose in battle invariably returning to their perch. Among the Assyrians, the eagle became an emblem of such importance, that their deity, Nisroch, was represented as eagle-headed. From the Assyrians the use of the eagle as a standard descended to the Persians, and from them probably to the Romans.

In the northern half of Asia, and among all the Turkish races, eagles are the constant companions of dragons, on the ensigns; China, India, Bactria, Persia, Egypt, the successors of Alexandria, the Etruscans, the Romans, the Celtæ, and the Arabs, had eagle *signa* of various kinds.

The ancient Persians carried the figure of a golden eagle at the end of a spear fixed upon a carriage. When Mohammedanism had eradicated most of their peculiar uses, the figure of the sun divided symbolic honors with the lion on their standards. At the present day the flag-staff of the Persians terminates in a silver hand.

The early Greeks employed for a standard a piece of armor at the end of a spear. The Athenians, at a later date, adopted the olive and the owl. Homer says that Agamemnon used a purple veil with which to rally his men.

The most ancient Roman standard was a bundle of hay at the top of a pole. This was followed by the figure of a hand, and, later, by a silver eagle. Pliny claims that the eagle was the first and principal military ensign; this was followed by the wolf, the minotaur, the horse, and the wild boar, in succession. After Trajan's conquest of the Dacians, the Romans adopted as a trophy the dragon, a general ensign among barbarians. They were embroidered in cotton and silk, and were usually of a purple color. Caius Marius in B.C. 102, made the eagle alone the ensign of the legions, and confined the other figures to the cohorts. At a subsequent period some of the old emblems were resumed. The wolf is among the ensigns on the column of Trajan. A black eagle was the ensign of Kalid, general of Mohammed, at the battle of Aismadin.

The emperors of the Western Roman empire used a black eagle, those of the East a golden one. The sign of the golden eagle, occasionally met with in taverns and places of public resort, is in allusion to the emperors of the East. Following the example of the Romans, nearly every country that has assumed the designation of an empire has taken the eagle for its ensign.

The Turkish military standard has for many ages consisted of a horse-tail surmounted by a crescent. The horse-tail seems to have been in former times used as a distinction of rank, the two ranks of pasha being distinguished, respectively, by two and three tails. A further distinction was marked by the placing of one above the other. The use of the crescent as a Turkish emblem dates from the conquest of Constantinople in 1453. Tradition states that long before the conquest, the crescent was the favorite badge of the city, while still bearing its ancient name of Byzantium, the town having on one occasion been preserved from a night ambuscade by the timely appearance of a new moon. It occurs on old Byzantine coins, often with a star between its horns. At the time of the conquest, the Turks found the crescent in every public place, and, believing it to possess some peculiar power making it a good omen, they adopted it for their own. Another tradition relates that the Sultan Othman saw in a vision a half-

moon, which kept increasing enormously, till its rays extended from the east to the west, and this led him to adopt the crescent upon his standards, with the motto, *Donec repleat orbem*. The crescent is also used as an emblem by Arabia, Mecca, Morocco, Egypt, Tripoli, and Japan.

The raven was, in ancient times, adopted by certain nations, notably the Danes and Scandinavians. It was also displayed on a Saxon banner. Among the Scandinavians, it was the symbol of slaughter, as the black flag was among pirates.

The lion of St. Mark is the characteristic device of Venice. It is a symbolical lion, represented as winged, and holding an open book, on which is written: *Pax tibi, Marce, Evangelista meus*. The complete heraldic description requires a sword with the point raised over the book, and a glory surrounding the whole.

France adopted the eagle from the Romans, and perpetuated the old Roman spirit. As a symbol of daring and defiance, the eagle has ever been foremost. From the Twelfth to the Fifteenth century, the chief standard of the French was the famous oriflamme. It is described as a plain red, or flame-colored silk gonfalon, square, and without any figure upon it. It was carried before the king of France as a specially consecrated ensign, and as the special royal banner. The French eagle was introduced by the First Napoleon as a regimental standard, but abandoned after his fall, and again adopted by Napoleon III. It is wrought of pure gold, and each one is valued at $2000. There is attached a richly embroidered ribbon of silk a yard in length and five inches in width. In the disastrous Franco-Prussian war of 1870, it is stated that the German army captured nearly two hundred of these costly eagles, to the great discomfiture of the French.

In England, the introduction of standards and emblems was clearly of a religious origin. St. Augustin was undoubtedly the first who displayed them. Having accomplished the conversion of the British king, Ethelbert, and his queen, the monk and his followers entered Canterbury in procession, chanting and carrying banners, on which were depicted crosses. The cross of St. George has been the badge of the kings of Britain and the nation since the time of Edward III. During the wars of the Roses there was a possibility of its termination, but it maintained its supremacy, and the combination of the roses became the floral national emblem. The Crusaders carried a St. George's cross on a white field, both on their breasts and on their backs, as well as on their standards.

The Lion, popularly called the "king of beasts," and the emblem of majesty and might, is the symbol of the British nation, and is borne in the royal arms, of which it forms one of the supporters, and which it surmounts as a crest. Up to 1340, the royal standard of England was charged with three lions *passant-gardant* in pale. Ossian says that in his time the king's standard was blue, studded with gold, and having on it the figure of a white horse. This was, undoubtedly, of Asiatic origin. The lion was a later idea. In the older armorial bearings there is a maneless lion, or, technically speaking, a lion *leoparded*. This term is still used by the heralds of France. The Emperor Frederick, in choosing his presents to Henry III., was actuated, as it is stated, by the bearing in the royal shield of England, *In quo tres leopardi transeuntes figurantur*. Another emblem of the nation is Britannia, the emblematical figure on the coin of the realm. It is a picture of Frances Theresa Stuart, the Duchess of Lenox, the most admired beauty of the court of Charles II.

The Russian emblem is a double-headed eagle on a golden-colored flag. The two-headed eagle signifies a double empire, European Russia and Asiatic Russia. This was formally adopted by the nation, but the symbol of the Russian bear has also been assigned to the Russian government by others, probably more as a nickname than anything else.

The emperors of Austria, who claim to be considered the successors of the Cæsars of Rome, also use the double-headed eagle, which is the eagle of the eastern emperors with that of the western, typifying the "Holy Roman Empire." Charlemagne was the first to use it, for on becoming the master of the whole German empire, he added the second head to the eagle, to denote that the empires of Rome and Germany were united in him. The adoption of the emblem occurred in A.D. 802.

Of the different eagles of heraldry, the black eagle is considered the most noble, especially when blazoned on a golden shield.

For ages the Chinese have used the figure of the dragon, a mythical monster, as the emblem of their national greatness. Siam adopts the white elephant. The national emblem of ancient Mexico was the swan; of the Aztecs after settling in the valley of Mexico, an eagle grasping a serpent and rising from a cactus plant. The symbol was adopted by the later nationalistic organizations, and is also the standard of the present republic.

The Liberty Cap (q.v.) dates from ancient times. Greeks, Romans, and Gauls held it in peculiar honor. After the death of Cæsar, the conspirators marched out in a body with a cap, as the ensign of Liberty, carried before them on a spear. Saturninus, in A.D. 263, when he had possessed himself of the Capitol, exalted a cap also on the top of a spear, as a token of liberty to all slaves who would join with him. Marius used the same expedient to rouse the slaves to join with him against Scylla.

The red cap of Liberty was the symbol in the perilous days of the French revolution.

It was the work of the Girondists, and appeared for the first time in the galleries of the Jacobin club. The red color was recommended "as the most cheerful," and it became at once the political fashion.

In the United States the American eagle, regarded as the largest and noblest of all his race, was adopted as the emblem of the nation. The name of *bald*, or white-headed eagle, has been applied to this bird on account of the snowy white color of the head and neck, a peculiarity which renders it a most conspicuous bird when at large in its native land. The remainder of its body is a deep chocolate brown. The tail and upper tail coverts are of the same white hue as the head and neck. Although the noblest of his kind, the bald eagle is not wholly free from faults. He is not himself a good fisher, although fond of fish; hence he watches the fish hawk, or osprey, and when he sees one on the wing, with talons loaded with game, he systematically robs him. This predatory propensity aroused the wrath of Benjamin Franklin, who strongly objected to the adoption of the bald eagle as a type of the American nation. Yet the lofty flight of wing; an eye that can gaze into the sun's rays; a courage that never brooks defeat; a devotion to his mate that is dove-like; amply compensate for his trait in the method of fishing, and he was chosen as the emblem of the American nation. See Flag.

NATIVE, a term mostly applied to metals, and employed to designate substances, as minerals, which are most of them more abundantly obtained from other minerals by chemical processes. Thus silver found pure, or nearly so, is called *native silver*. whilst most of the silver in use is procured from ores in which it exists variously combined.

NA'TROLITE, soda mesotype, feather zeolite, *spreustein*, radiolite, Bergmannite, a hydrous silicate of the zeolite section, containing silica, soda, and alumina, with about nine per cent. of water, and usually oxide of iron, crystallizes in the trimetric system; crystals usually slender and interlacing, divergent, or stellate; also fibrous and massive. Hardness, 5 to 5.5; sp. gravity, 2.17 to 2.24. Lustre vitreous, sometimes pearly; color white, grayish, and yellowish; transparent, translucent. The following is an analysis of crystals from Auvergne: silica, 47.76; alumina, 25.88; soda, 16.21; water, 9.31. The following were the constituents of iron natrolite: silica, 46.54; alumina, 18.94; peroxide of iron, 7.49; soda, 14.04; water, 9.37; iron, 2.40; manganese, 0.55. In North America natrolite occurs in Nova Scotia in trap rock; at Cheshire, Conn.; at Copper falls, lake Superior, in crystals associated with native copper. Natrolite is also found at Bergen hill, N. J.

NA'TRON, or Trona, an impure sesquicarbonate of soda, $Na_2CO_3+2NaHCO_3+3H_2O$, which always contains sulphate of soda and chloride of sodium. It is obtained from the margins of lakes in Egypt, Siberia, Thibet, etc., and from the borders of the Black and Caspian seas.

NATRONA, an east central county of Wyoming, drained by the North Platte river and Casper creek; 5475 sq. m.; pop. '90, 1094. Co. seat, Casper.

NATRON LAKES. Natron was one of the substances employed by the ancient Egyptians in embalming mummies. They called it *hesmen*, and, together with the lakes from whence it was derived, it is mentioned in texts of the twelfth dynasty, *circa* 1800 B.C. These lakes, eight in number, are situated in a valley of the Libyan desert, about 60 m. w.n.w. of Cairo. They are below the level of the sea, and the natron is obtained by evaporation. The locality is also renowned for four monasteries, Deyr Suriana, St. Maiarius, Amba Bishoi, Deyr Baramoos, from whose libraries of Arabic, Coptic, and Syriac MSS. the national collections have been enriched. In the time of St. Pachomius 5000 anchorites dwelt here; they at present number about 300.

NATTERJACK. See Toad.

NATU'NA ISLANDS, The, lie to the n.w. of Borneo, between the latter and the Malay peninsula. They are densely wooded and mountainous. Ranay, or Great Natuna island, is in 4° n., 108° 10′ e. The area of the group is about 660 sq. miles.

NATURAL, in music, a note belonging to the diatonic scale of C, and neither elevated by a sharp nor depressed by a flat. When a note has been so elevated or depressed, the natural sign ♮ prefixed to it on its recurrence restores it to its place on the scale. When music is written on a key with a signature of sharps or flats, it is the office of the natural sign to counteract the signature as regards the note to which it is prefixed.

NATURAL BRIDGE, one of the chief natural curiosities in the United States, ranking in interest next, perhaps, to Niagara falls and the Mammoth cave. It is situated in Rockbridge co., Va., 115 m. w. of Richmond, and 160 m. s.w. of Washington. The bridge spans a deep chasm, through which a small stream flows, and is formed by an immense limestone stratum fashioned into an arch 215 ft. high. Its length is 93 ft. and the thickness of the crown of the arch is about 40 feet. The average width of the arch is 80 feet. A public road passes across it from which there is a beautiful view, not only of the long chasm where great forest trees tower up from below but also of the Blue Ridge mountains.—In Walker co., Alabama, and in Califor-

nia also there are other natural bridges, but none that rival this one. The one in Alabama is about 70 ft. high and spans 120 ft.; and the largest of those in California is across a small creek emptying into the Hay fork of Trinity river; is 3,000 ft. wide and has an arch 20 ft. high by 80 ft. across. It has been suggested that these bridges are the remnants of great caverns.

NATURAL GAS. See Gas, Natural.

NATURAL HISTORY, in the widest sense, includes all natural science, and has the whole of creation for its subject. In this sense the term was employed by the philosophers of antiquity. But it is now limited to those branches of science which relate to the crust of the earth and its productions. Of these, geology and mineralogy have for their subject inorganic portions of creation; botany and zoology, the various branches of which are often pursued as separate sciences, with physiology, have for their subject organized creatures. Natural history takes cognizance of the productions of nature, and of their relations to each other, with all the changes on the face of the earth, and all the phenomena of life, both animal and vegetable. It derives assistance from other sciences, particularly chemistry and natural philosophy; and some of the branches of chemistry may also be regarded as branches of natural history. When man himself is considered as a subject of scientific study, psychology must be added to the branches of natural history, but in the term as commonly employed this can scarcely be said to be included.

In every department of natural history, classification is of the utmost importance, and scarcely less important is a scientific nomenclature suited to the classification. The subjects of study are so incalculably numerous that an arrangement of them in well-defined groups is necessary to any considerable attainment in the knowledge of them; and it is only by systems of classification which arrange smaller groups in larger, and these in larger and larger again, that natural history has been brought to its present state. The very division of natural history into different sciences is a result of such a classification, and implies a recognition of the largest and highest groups. It is not always in the establishment of these groups that the greatest difficulty is experienced. The primary distinction of all the subjects of natural history into organized and unorganized, or into those having life and those not having life, presents itself very readily to every mind. And equally natural and necessary is the distinction of organized beings into plants and animals, however difficult it has been found to draw the precise limit between the lowest of plants and the lowest of animals. Another distinction readily presents itself to the student of living beings in the kinds which retain the same characters from one generation to another. But here arises one of the most important of all the questions of natural history, what a *species* is, and how it differs from a *variety*. For this we refer to the article Species. But much difference of opinion as there is on this point, the common and long-prevalent notion may be assumed, as suitable enough for guidance in all that relates to classification, that those are distinct *species* which cannot by any change of circumstances—or, let it be said, by any *ordinary* change of circumstances, and within any *moderate* period of time—be so modified as to be transmuted one into another, whilst those are only *varieties* of which the modification and transmutation can be thus effected. Thus, in botany, *Brassica oleracea* is a species, of which kale, cabbage, cauliflower, broccoli, Brussels sprouts, etc., are varieties. Species, grouped together, according to their natural affinities, form *genera;* but a *genus* does not necessarily consist of more species than one; for, whilst some contain hundreds of species, others, apparently very distinct, contain only one as yet known to naturalists. The distinctions by which genera are separated are of course arbitrary, and are admitted to be so by those who deny that the distinctions between species are arbitrary, or that there is any uncertainty about them but what arises from the imperfection of our knowledge; for, at present, it must be admitted on all hands, that the uncertainty is in innumerable instances very great, what are species and what are varieties. The great object, however, in the formation of *genera* is that they shall be accordant with the facts of nature; and so in regard to the larger or higher groups which are composed of associated genera, as tribes, families, orders, classes, etc. But in all this, the great difficulty is that affinities exist on many sides; and that groups cannot be satisfactorily arranged in the order of a series, but often rather as if they radiated from a common center; whilst otherwise viewed, the same groups might seem to radiate very differently from another common center. A *natural system* is one framed with the utmost possible regard to all these facts; an *artificial system* fixes on one class of facts and proceeds upon it, in disregard of all others. See Botany. In the inorganic departments of nature a *species* is of course something different from what it is in the organic. But classification still proceeds on the recognition of facts in nature itself, which it is sought to exhibit in the groups that are formed. See Mineralogy.

The nomenclature of natural history, in so far as it relates to organic beings, continues essentially as it was established by Linnæus. See Genus. The names have in many cases been changed, but not the mode of nomenclature.

NATURALISM is the name given in philosophy to those systems which profess to account for the phenomena of nature, by what they call the necessary action of unintelligent and inherent forces. Such, for example, was the doctrine of Lucretius (q.v.),

Leucippus (q.v.), and Epicurus (q.v.). It leads also to various forms of theological speculation and belief which deny the agency of a personal God in the production, preservation, and government of the physical, intellectual, and moral universe. In this aspect, therefore, naturalism is opposed to theism. See MATERIALISM.

NATURAL INFANCY is a term used in law to designate a period of non-responsible life. It ends with the seventeenth year. See *Wharton's Dictionary*. It is therefore distinct from legal infancy, which extends to the age of twenty-one and is coincident with the period of minority.

NATURALISM IN LITERATURE. See REALISM AND NATURALISM.

NATURALISTS was a name applied by writers of the eighteenth century to the school now known as Pantheists and Rationalists. The term is now obsolete. See PANTHEISM, RATIONALISM, and GERMAN THEOLOGY.

NATURALIZATION. The right of an adult citizen to throw off the natural allegiance due to the state of his birth and take a similar obligation to a foreign sovereignty has long been contested, and by many nations is not yet fully admitted. In the colonial history of this country the English system of restricting the rights of citizenship seriously conflicted with the obvious policy of a new country to strengthen itself by immigration; and the declaration of independence charges George III. with endeavoring "to prevent the population of these states; obstructing the laws for the naturalization of foreigners; and refusing to pass others to encourage their migration hither." Under the old confederation the exercise of the power of naturalization was vested in the separate states. As the articles provided that the citizens of each state should be entitled to all the privileges and immunities of the citizens of all the several states, much confusion of rights and disagreement as to the legal status of foreigners arose. In the new constitution, therefore, it was provided that "congress shall have power to establish a uniform rule of naturalization" (art. I., sec. 8). In pursuance of this authority congress has passed many acts at various dates from 1802 onward, and treaties have been made with several foreign nations on the subject. The naturalization may be collective, as in the acquisition of new territory by purchase or conquest; or personal, where citizenship is conferred upon an individual upon his complying with the provisions of the law. When once naturalized the applicant possesses all the immunities and privileges of native citizens, with these exceptions: he is not eligible to election as president or vice-president of the United States, and cannot serve as senator until he has been a citizen for nine years, or in the house of representatives until he has been a citizen seven years. (Constitution, art. II., sec. 1; art. I., sec. 2, 3.) In every other particular the naturalized stands on the same footing with the native citizen, and is entitled to the protection of the government abroad as well as at home. Decisions of the U. S. supreme court (1817) definitely settle the rule that the states had no jurisdiction on the subject of naturalization. But they may pass laws admitting foreigners to any privileges which fall short of citizenship; they may confer the right of acquiring and transferring property, or may even make them voters. The policy of the government of this country has always been very liberal in regard to the conditions of acquiring citizenship, as a general increase of population has up to this time been considered most desirable; and though there was weighty authority for the doctrine that an American citizen could not renounce his allegiance without consent of the government and by process of law, yet the state department has always acted on the adverse theory. Without examining in detail the many acts which have been passed to regulate the process of naturalization, the present provisions of the law may be briefly classified as follows: Those persons who have resided in the United States prior to June 18, 1812, may be admitted without any declaration of intention. Any alien, twenty-one years old or more, who has served in the military forces of the United States, may be admitted without preliminary declaration, on proof of one year's residence, of good moral character, and of an honorable discharge from the service. Foreign seamen may obtain full *protection* as American citizens by filing a declaration of intention in a competent court; but to become citizens, in fact, they must afterwards serve three years on a merchant-vessel of the United States, and present at the end of that time a certificate of good conduct and a discharge. In case of an alien minor who has resided in the United States three years immediately preceding his twenty-first birthday and has five years of continuous residence before making application, including the three, declaration of intention is not required; but he must take oath at the time of application that for at least two years he has had the *bona fide* intention of becoming a citizen, and in all other ways must comply with the general rule. The language of the act regulating the naturalization of minors is rather obscure, and it was formerly maintained by many that of his five years' residence, two must be passed after his coming of age, but it is now settled that if the residence extends from his fifteenth to twenty-first year it will suffice. The children of foreign parents who are naturalized become so also, if minors and living in this country at the time, and it has been held that the naturalization of the father only suffices. Any person not coming under the classes already mentioned must, at least two years before admission, make oath before a district or circuit court of the United States, or before any court of law having common law jurisdiction and possessing a seal and clerk, that it is his *bona fide* intention to become a citizen and to renounce

forever all allegiance to any foreign prince, potentate, state, or sovereignty; and, by name, that particular prince, state, or sovereignty, of which he is at that time a subject or citizen. A certificate of the fact that such a declaration has been made is made out by the clerk, signed and sealed and given to the applicant as evidence of the declaration of intention. Five years' residence in the country, and one year in the state where the application is made, are necessary; by residence is meant permanent abode, but it is not affected by temporary absence on business or pleasure. The court must also be satisfied that the person applying is of good character and well disposed to the public welfare and the principles of the constitution. If the alien have hitherto possessed any hereditary title or order of nobility, he must forever renounce it. As to evidence, that of residence must rest on other proof than the applicant's oath, but a single witness is taken on this point, and on others the alien's oath is generally deemed sufficient. The depositions, certificate of declaration of intention, and the final order of admission, compose the record of the case and are put on file. A certificate of naturalization is made out, sealed, and signed by the court clerk and is given to the alien as evidence of his citizenship. The record is conclusive and cannot be contradicted or overthrown, except by proof of perjury or other fraud in its procural. Severe punishment by fine and imprisonment is provided for the taking of any false oath or affirmation in connection with the proceedings; for any false personation either by applicant or witness; for counterfeiting or imitating any instrument, paper, or proceeding used in the case or authorized by the naturalization laws; for selling or disposing any such oath, certificate or notice, as genuine, or for falsely representing one's self as a citizen of the United States without having been duly admitted to citizenship. Aliens who are subject to a country at war with the United States at the time of application cannot be naturalized while the war continues. In the early days it was several times held that the wife of a naturalized alien had not herself acquired the status of a citizen, if originally alien; but it was long since decided by the supreme court that the citizenship of the wife should follow the naturalization of the husband, and that it makes no difference whether the marriage is contracted before or after the citizenship of the husband is secured. The right of expatriation, as it is called, that is of freedom to throw off the natural allegiance and acquire a new allegiance to another government, is now generally recognized by the nations of Europe and America, though not as a matter of inherent right but rather of permission from the authorities, and as a matter of public policy to prevent disagreeable international complication. The English act of 1870 provides both for the naturalization of aliens, after five years' residence and application to the secretary of state, and also that any British subject who shall voluntarily become naturalized in any foreign country shall from that time on be regarded as an alien and no longer a British subject. A treaty was entered into in the same year between Great Britain and our country, providing that aliens who have complied with the conditions of admission and have been fully naturalized should be recognized as such by the country of their birth; but the original allegiance may be recovered by much the same process. Treaties were also made by the United States, in 1868, with Prussia, Bavaria, the grand duchy of Baden, Würtemburg, grand duchy of Hesse, Belgium, and Mexico; in 1869 with Sweden and Norway; in 1870 with the Austro-Hungarian empire, and in 1872 with Ecuador and Denmark. These treaties have the same general stipulations, stating a period of residence, usually five years, after which naturalization is permissible and to be recognized, reserving to the country of the original allegiance the right to punish for crime committed, or to compel the execution of obligations entered into, before the change of domicile, and entering into mutual obligations to recognize the rights of each other. The question on which there is the greatest likelihood of disagreement under existing laws, arises where an alien comes to this country, becomes duly naturalized and then returns. Is he then liable to undergo military service or otherwise recognize the allegiance of the state of his birth? Some European nations hold that such a transaction is on its face evidence of an intention to escape the natural obligations, but the policy of our government has always been to protect its adopted citizens where the naturalization is not tainted by fraud.

NATURAL'IZED. In the language of botanists and zoologists, those plants and animals are said to be *naturalized* in any country, which, having been introduced into it by man, have established themselves so as to exist without his care. A plant or animal is never said to be naturalized so long as it exists merely in a state of cultivation or domestication, but is so when it becomes truly wild, and, unaided, competes successfully for a place among those which are indigenous to the country. Thus, the horse is not naturalized in Britain, or in most of the countries in which it is most highly valued; but both the horse and the ox may be said to be naturalized in South America. Many of the plants now most characteristic of southern Europe are sometimes said to have been originally introduced from the east; and some that are abundant in many parts of Britain were, in all probability, brought from the continent of Europe. Some of these almost evince their foreign origin by growing chiefly near ruins, or in places which have long been the seats of human habitation. Many plants now naturalized in Britain appear to have been originally brought for medicinal use, although now disregarded. In many cases, however, naturalization has taken place without any attempt having ever been made by man to introduce the plant, even for cultivation; and thus many

European weeds are now common in America, the seeds having found their way thither with those of more valuable plants, or in some such accidental manner. The same thing has taken place as to animals. Thus mice and rats find their way from one country to another; thus the bed-bug found its way at no remote date to America; other insects have been even more recently introduced with foreign productions of different kinds; and a mollusk (see DREISSENA), previously unknown, has established itself in some British rivers and canals. The pheasant may be mentioned as an instance of naturalization in Britain designed and successfully accomplished by man. An *acclimatization society* has recently been formed in London, which has for its object the naturalizing, rather than what may more strictly be called the acclimatizing, of animals deemed suitable and desirable. It is unquestionable that much may be done by naturalization of animals, not only to render rural scenes more attractive, but also to increase their economical productiveness. Perhaps nothing of this kind has received so little of the attention due to its importance as the naturalization of fishes. See PISCICULTURE.

NATURAL OBLIGATION, in law, means an obligation which is supposed to be prescribed by the law of nature, as the obligation of a parent to maintain his child. In England such an obligation is not recognized by the common law, and therefore it was necessary in the poor-law statutes to punish by a penalty parents who, being able, refused or declined to maintain their children. In Scotland the natural obligation of a parent to maintain his child is, however, recognized by the common law, though it is also enforced by the poor-law statute.

NATURAL PHILOSOPHY is a term frequently employed in this country to designate that branch of physical science which has for its subject those properties and phenomena of bodies which are unaccompanied by any essential change in the bodies themselves. It thus includes the various sciences which are classed under *physics* (q.v.) in the limited sense of that term.

NATURAL THEOLOGY is the name commonly applied to the knowledge concerning the existence and attributes of God, furnished by the organized universe. This knowledge springs from the answers to two questions: 1. Is this complicated universe the work of a personal creator, or a result of impersonal force? 2. If of a personal creator, what does it, as his work, show concerning his character, attributes, and relations to his creatures? The answers to these questions depend on the assumptions that every change must be effected by some adequate cause, and that design proves the existence of a designer, whose attributes and character are indicated in his work. The basis for these assumptions is found, by the best thinkers, in the intuitive beliefs of the human mind. While any instance and degree of design prove the existence of a designer, the sum total of all instances and all degrees must be taken, in order to a full knowledge of the designers; and if, in all the instances, unity of design be manifested, then the existence of one designer, adequate to all the work, is proved. The investigation, therefore, requires the examination of all orders of objects and creatures, of all degrees of complexity and completeness in the properties, qualities, constitutions, and relations, physical, mental, and moral, which they display. The examination may be practicable only in part, and only as to results; but in proportion as it can be completely made and can be extended also to the means and processes by which the design has been carried into effect, the proof of high qualities in the designer will be increased. The proof of design in Paley's often cited instance of a watch, picked up in crossing a heath, cannot be set aside by raising questions concerning the length of time employed, or the instruments used in its construction; and while the slightest inspection of it may furnish proof of design, the proof will be strengthened and the display of design increased by a thorough and skillful examination of its complicated mechanism. If machinery that will make many watches be examined, the degree of design will be proportionally greater; and if a watch could be made to throw off other watches as a part of its work, instead of the proof of design being abrogated, it would be marvelously increased. Some persons, indeed, claiming to be philosophers, seek to limit all investigation to the phenomena of nature, denying or disregarding efficient and final causes as either not existing or not proved. They say, "Our reflecting reason is the sole cause of all the apparent design which exists and which is nothing but the combination of natural materials and forces." But, to this assertion it is sufficient to reply that it fails to account (1) for the existence of the natural materials and forces; (2) for the combination of them in the production of one result; (3) for the existence of the reason of man, which is capable of reflection, and (4) that it does not show how reason can be the cause of a design—or of anything else—which is only apparent, not real. The history of mankind shows that there has at all times existed, in the mind, some idea of God, or of gods, or of some supernatural beings, to be sought, worshiped, or feared. Some, indeed, have asserted that the most degraded tribes have no such idea, and that the deaf and dumb also are destitute of it until they are instructed. But to this it is answered that while, in the lowest degradation, the *light* of the idea may be nearly or quite extinguished, enough of dark superstition remains to show that the light once shone; as, in an extinguished or dimly burning lamp, the very blackness of the wick proves the previous existence of a brighter flame. And, as to the deaf and dumb, granting the facts alleged, it cannot be certainly maintained that they

have no idea of God, because they, in their want of education, cannot express it in language; or we, in our imperfect intercourse with them, cannot draw it forth from their minds. Some have regarded the idea of God as innate in the human mind, from the fact that the belief in his existence has been so general in all ages of the world. But this theory is now held, if at all, only in the modified form that in the development of the mind the idea of God is certainly reached through the study of nature and of man.

See Paley's *Natural Theology* (Lond. 1802; new edition by Lord Brougham and Sir Charles Bell, 1836) and the Bridgewater and Burnett Treatises.

NATURE-PRINTING. This is a process by which engravings or plates answering thereto are produced by taking impressions of the objects themselves, and printing from them. There is some dispute as to the original inventor of this art; Denmark claims it for a native of Copenhagen, Peter Kyle, a goldsmith, who died about 1833, leaving the MS. description of his invention in the archives of the royal collection of engravings in that capital. It is, however, admitted that no use was made of his invention. In 1853, Alois Auer, director of the state printing establishment of the Austrian empire, published his process, and also some very beautiful works illustrated by this art. About the same time, in England, Mr. G. W. Aitkin made known his discovery of an exactly similar process, and showed some very beautiful plates of feathers, ferns, etc. But whatever other claims may be advanced, it is certain that Alois Auer holds undisputed right to the title of original inventor and practical applier of the invention. The process is very simple, as practiced by Auer; but it cannot be applied to any objects except those with tolerably flat surfaces, such as dried and pressed plants, embroidery and lace, and a very few animal productions. The object is placed between a plate of copper and another of lead, both worked smooth, and polished; they are drawn through a pair of rollers, under considerable pressure—M. Auer says 40 to 50 tons; then, when the plates are separated, it is found that a most beautiful and perfect impression of the object has been made in the leaden plate. This may be used directly as an engraved plate, if only a very few impressions are wanted; but as it is too soft to resist the action of the press for practical purposes, a fac-simile of it is obtained in copper by the electrotype process, which is used as the printing-plate. The best practical use to which nature-printing has yet been applied is the multiplication of patterns of lace and other figured surfaces, either in textile materials or metals, for trade purposes. Lace-prints especially are so exactly like the originals that the most fastidious can require nothing more; hence the cutting up of valuable pieces of lace for patterns has been saved. Henry Bradbury, of the then existing firm of Bradbury & Evans, London, made nature-printing his special study, and produced the exquisite works, *Nature-printed Ferns*, and *Nature-printed Sea-Weeds*, in 2 vols. each (London: Bradbury & Evans).

NAUCRATIS, an ancient city of Egypt, was situated in the Nile delta, near the modern village of Nebireh, 47 miles southeast of Alexandria. It flourished in the seventh century, B.C., and was widely known as a centre of the worship of Aphrodite, as well as for its pottery. It was granted by Amasis, king of Egypt, to the Greeks, as a settlement and trading post, and was the only place at which they were allowed to trade. Its site was discovered by Flinders Petrie in 1884, and subsequently valuable relics were exhumed by him.

NAUGATUCK, a borough in New Haven co., Conn.; on the Naugatuck river and the New York, New Haven and Hartford railroad; 18 m. n.w. of New Haven. It was incorporated in 1844, and has a national bank, electric lights, public library, high school, daily and weekly newspapers, and manufactories of india-rubber goods, knit underwear, malleable iron, buttons, and agricultural implements. Pop. '90, 6,218.

NAUHEIM, a t. in the duchy of Hesse-Darmstadt, Germany, n. of Frankfort; pop. '95, 3,480. Its mineral springs attract many visitors annually. The waters, both as an external and internal application, are highly valued as a remedy for diseases of the bowels and cutaneous affections. Mineral springs abound in the vicinity also, and their waters, with those of Nauheim, are extensively exported for use in other parts of Germany. Salt-works had long existed at Nauheim, but the baths were not opened till 1834. A fountain, opened by a shock of earthquake in 1846, produces a large amount of salt per year, besides furnishing a supply of water for the bath-houses. The baths are annually visited by about 6,000 people.

NAUMA'CHIA, a Greek word, signifying literally a naval battle, afterwards, among the Romans, a spectacle which consisted in the imitation of a naval battle. Julius Cæsar was the first to introduce a naumachia into Rome, 46 B.C., causing a portion of the Campus Martius to be dug to form a lake, on which the "spectacle" came off. Augustus made an artificial lake (*stagnum*) near the Tiber for the same purpose, which was afterwards frequently used for naumachiæ. Claudius also exhibited a splendid one on lake Fucinus. Nero, Domitian, and others were likewise fond of such amusements. The combatants were termed *naumacharii*; they were for the most part either captives or condemned criminals; and the rival fleets took their names from the famous maritime nations of antiquity: Tyrians and Egyptians, Rhodians and Sicilians, Persians and Athenians, Corcyræans and Corinthians, Athenians and Syracusans. The magnificence of these spectacles may be estimated from the fact that in the one exhibited on lake Fucinus 19,000 men were engaged. These *naumachiæ* were not *sham-fights*, any more than ordinary gladiatorial combats. Both sides fought on in real earnest for dear life

until one was utterly overpowered; and, as a rule, multitudes were "butchered to make a Roman holiday."

NAUMANN, Emil, b. Berlin, 1827; son of Moritz Ernst Adolf. He studied music under Mendelssohn, and in 1848 brought out his first compositon of importance, an oratorio called *Christ, the Messenger of Peace*. In 1852 he published a study of German church music, under the title of *The Transformation of Protestant Church Music*. About the same time he became director of church music at Berlin. He subsequently wrote, besides many compositions in sacred music, a number of operas, of which *The Witch of the Mill* and *Judith* deserve mention, and a cantata on the *Destruction of Jerusalem*. His work on the *Introduction of Psalmody into the Evangelical Church* appeared in 1856, and his *Music in the History of Civilization* in 1870. He d. in 1888.

NAUMANN, Johan Gottlieb (or Giovanni Amadeo), composer, was born at Blasewitz, near Dresden, April 17, 1741, and died in Dresden Oct. 23, 1801. He was the son of a peasant, but was placed in school in Dresden, where he studied music by himself, and attained considerable proficiency, and was taken on a professional tour by a Swede, whom he deserted about 1757 to study under Tartini, at Padua. In 1760 he went to Naples, and then to Bologna to study counterpoint. At Venice, soon after, he produced his first poems, *San Samuele*. Returning to Dresden in 1760, he was made court composer of sacred music; about 1773 became capellmeister, and in 1786 was made ober capellmeister. Besides *La Clemenza di Tito* (1769), *Solimanno* (1772), *Protesitao* (1793), and other operas, he wrote eleven oratorios, twenty-one Te Deums, etc. His setting of Klopstock's "Vater Unser" is as well known as anything he wrote. He left three sons: Karl Friedrich (q.v.), Moritz Erntz Adolf, M.D., and Constantin August, a mathematician and astronomer.

NAUMANN, Karl Friedrich, 1797–1874; b. Germany; educated at the Freiberg school of mines, and at the universities of Jena and Leipsic. In 1821 he made a journey to Norway for scientific purposes, and the results of his observations were published in his *Contributions to the Knowledge of Norway*, 2 vols., 1824. Two years later he became professor of crystallography at Freiberg, and in 1835 he was transferred to the chair of geognosy in the same institution. In 1842 he was called to the chair of geognosy and mineralogy at Leipsic. The most important of his works on mineralogy and geognosy are: *Elements of Crystallography*, 1841; *Elements of Mineralogy*, which ran through many editions; and *Manual of Geognosy*. He became privy councilor of mines in 1866.

NAUM'BURG, a t. of Prussian Saxony, in the government of Merseburg, situated 17 m. s.s.w. of the town of that name, on the Saale, in the midst of a striking amphitheater of vine-clad hills. Besides its cathedral—a noble Gothic structure, completed in 1249, with two choirs, and containing many beautiful sculptures—there are several other churches. Naumburg is the birthplace of Charles Lepsius, the Egyptologist. The manufactures are woolen fabrics, combs and ivory articles, etc. During the Thirty Years' War and in the campaigns of 1806 and 1813, Naumburg, in which the Prussian magazines were lodged, was a place of great importance. Five annual fairs are held here. Pop. '95, including garrison, 21,202.

NAUPACTUS. See Lepanto.

NAUP'LIA (Greek Navplion), a t. and seaport in the Morea, Greece, at the northern extremity of the gulf of Argos or Nauplia, and 7 m. s.e. of the town of Argos, and 3 m. s. of the site of ancient Tiryns. In the church of St. Spiridion, Capo d'Istria was assassinated in 1831. Nauplia is of high antiquity. At an early period it was the port and arsenal of Argos. In the 13th c. it was occupied by the Venetians, and was taken by the Turks in 1540. From 1824 to 1835 it was the capital of Greece, and had a population of upwards of 12,000; but on the removal of the court to Athens it fell into decay. Pop. 5,500.

NAU'SEA is a distressing sensation always referred to the stomach. It is unattended by pain, but is usually accompanied by a feeling of general languor or debility, a small and often irregular pulse, a pale, cool, and moist skin, general muscular relaxation, an increased flow of saliva, and a sensation that vomiting will supervene. It is most commonly a *direct* symptom of disease or disorder of the stomach, but sometimes it is a very important *indirect* symptom of disease of some part at a distance from the stomach—as, for example, the brain or the kidney. The nausea which is so troublesome to pregnant women is due to the irritation excited by the enlarged uterus being reflected by nervous agency to the stomach.

NAUSETS. See Massachusetts Indians.

NAUSHON. See Elizabeth Islands.

NAU'TÆ, CAUPO'NES, ETC. These words are the commencement of an edict in Roman law, which made shipmasters, innkeepers, and stablers liable for the safety of the goods brought into the ship, inn, or stable. The same doctrine is adopted by the common law of England and Scotland, subject to variations produced by the carriers' act, and railway and canal traffic act, so far as regards carriers and railway and canal companies.

NAU'TICAL ALMANAC, a work projected for the special behoof of astronomers and navigators. See Almanac. It is chiefly valuable to the latter class from its containing

tables of the "lunar distances."—i.e., distances of the moon from a few (5 to 7) of the more prominent stars, given for every three hours throughout the year—by which at the present day longitudes (see LATITUDE AND LONGITUDE) are most conveniently and accurately determined. To the astronomer the *Nautical Almanac* furnishes a great mass of important data; it gives the position of the moon in right ascension and declination for every hour, and the sun's latitude and longitude for every day in the year; it shows the obliquity of the ecliptic, the sun's and moon's parallax, aberration, etc., at different times; it supplies the necessary data for the determination of the real or apparent size, position, and motion of the planets and their satellites; it fixes accurately the places of about 150 fixed stars, and gives full details concerning eclipses, occultations, transits, and other celestial phenomena occurring during the year. It is generally issued four years in advance for the sake of mariners going on long voyages.

NAUTICAL SURVEYING. See HYDROGRAPHY.

NAUTILUS, a genus of *tetrabranchiate cephalapoda* (q.v.), extremely interesting as the existing representatives of an order of mollusks now reduced to a very few species, but of which the fossil remains attest the great abundance in former geological periods. The species of this genus are found only in the seas of warm climates. One or more of them must have been known to Aristotle, as appears from his description, which, however, is not minute. Yet it is but recently that they came under the observation of modern naturalists; and they were very imperfectly known, till a specimen, obtained by Dr. Bennett in a bay of the New Hebrides in 1829, was submitted to the examination of Prof. Owen, and became the subject of a valuable memoir by him. The shell, indeed, has long been common enough in collections, being plentifully found, entire or in fragments, on many tropical shores; but from the shell alone little could be learned concerning the animal to which it belonged. The shell is spiral, the spire not at all elevated; and thus, in external form, resembles the shells of many species of snail; but internally it is *camerated,* or divided into chambers, by transverse curved partitions of shelly matter. In a very young state this structure does not exist; but as the animal increases in size it deserts its first habitation, which then becomes an empty chamber, and so proceeds from one to another still larger, occupying the outermost only, but retaining a connection with all by means of a membranous tube (*siphuncle*) which passes through the center of each partition. The use of this connection is not known; but the most probable supposition is that the animal is enabled, by throwing air or some kind of gas into the empty chambers of the shell, or by exhausting them of air, to change the total weight, so that it may rise or sink in the water at pleasure. It commonly inhabits the bottom of the sea, where it creeps about, probably like the gasteropods, by means of a large muscular disk with which the head is furnished; but it sometimes rises to the surface, and is to be seen floating there. Dr. Bennett states that the specimen which he fortunately captured attracted his attention, when thus floating, as an object resembling a dead tortoise-shell cat. The story of its spreading a sail is as fabulous as the similar story regarding the argonaut. The head and arms can be protruded from the shell, and can also be completely retracted within it. There are numerous arms attached to the head, 19 in the best-known species; there are also numerous other tentacles; but none of these organs are furnished with suckers, and they are feeble in comparison with the corresponding organs of many of the higher or dibranchiate cephalopods. The mouth is of the parrot's-bill form, as in the other cephalopods; but the mandibles are not entirely composed of horny matter, their extremities being calcareous and of a hardness apparently adapted for breaking shells. Their edges are also notched, and show an adaptation for crushing rather than for cutting. The tongue is large. The gizzard is muscular. The food appears to consist, at least in great part, of crustaceans.

Only three species of nautilus are known, of which the best known and apparently the most abundant is the PEARLY NAUTILUS (*N. pompilius*), which is found in the Indian and the Pacific oceans. Its shell is beautifully nacreous within; and is externally porcelain-like, white, and streaked with reddish chestnut. The shell, being large, thick, and strong, is used for a variety of purposes by the natives of the East Indies and South Sea islands; it is also made into ornaments of various kinds in China and elsewhere. The animal is eaten by the Fijians and other South Sea islanders, and is much esteemed as an article of food. The Fijians capture it by means of a basket-trap, somewhat like those used for catching lobsters, baited with boiled crayfish. The name PAPER NAUTILUS has sometimes been given to the argonaut (q.v.). See illus., Mollusks, fig. 25.

Fossil Nautilus.—About 150 species of fossil shells have been referred to this genus. They occur in all the strata from the upper silurian to the most recent deposits. Numerous forms, however, which exhibit very wide differences, have been incongruously associated under this generic name. The paleozoic nautili are so remarkable that they must certainly be referred to one or more separate genera; some of the carboniferous species have a square back, and the whorls either compact or open in the center, while the last chamber is more or less disunited from the shell; and the Devonian clymenia has angular sutures and an internal siphuncle. Until a careful revision of this section of the cephalopoda is made it will be better to consider the species as belonging to the family *nautilidæ,* and not to the genus *nautilus.* See illus., MUSCHELKALK PERIOD, fig. 1.

NAUTCH GIRLS. See BAYADERES.

NAUVOO, a city in Hancock co., Ill.; on the Mississippi river at the head of the lower rapids 8 m. s. of Fort Madison. It was built by the Mormons in 1840, and in 1846 contained a population of 15,000. Its principal feature was a great temple of polished marble, original in style and imposing in appearance. After the murder of Joseph Smith (see MORMONS), the temple was burned. The town was afterwards bought and occupied by a French socialist community, under the leadership of M. Cabet. This experiment also proved a failure. The town was incorporated as a city in 1869, and contains a high school, St. Mary's academy, public park, the arsenal and residences of the early Mormon leaders, and a bank. Pop. '90, 1,208.

NAVA'JOS, a tribe of Indians belonging to the family of Shoshones and Apaches, and occupying a reservation in n.w. New Mexico and n.e. Arizona, comprising nearly 3,500,000 acres. They were formerly hostiles, but were subdued by the U. S. troops, and are at present peaceable and industrious. They number over 17,000, and possess 130,000 sheep and goats and 10,000 horses. A specialty with this tribe is the manufacture of the Navajo blankets, which are valued for their warmth and durability.

NAVAL ACADEMY, U.S. See UNITED STATES NAVAL ACADEMY.

NAVAL ARCHITECTURE. See SHIP-BUILDING.

NAVAL CADET, the name given to the students at the Naval Academy (see NAVAL SCHOOLS OF INSTRUCTION), where they have a four years' course of instruction, followed by two years aboard of a naval vessel in commission for sea service; after which they return to the Naval Academy for a competitive examination for the grade of ensign. The title of students at the Naval Academy was first acting-midshipman, changed to midshipman in 1862, cadet-midshipman in 1867, and naval cadet in 1882. The pay while at the academy is $500 per year, and after leaving $950 per year at sea.

NAVAL CROWN, in heraldry, a rim of gold round which are placed alternately prows of galleys and square sails. The device is said to have originated with the Roman emperor Claudius, who, after the conquest of Britain, instituted it as a reward for maritime services. He who first boarded the enemy's ship, and was the occasion of its being captured, was entitled to a naval crown. A naval crown supporting the crest in place of a wreath, occurs in various grants of arms in the early part of the present century, to the naval heroes of the late war. The crest of the earl of St. Vincent, bestowed on him after his victory over the Spanish fleet in 1797, is issuing out of a naval crown or, enwrapped by a wreath of laurel vert, a demi-pegasus argent maned and hoofed of the first and winged azure, charged in the wing with a fleur-de-lis or.

NAVAL RESERVE. Among all the nations the United States stand alone in making no provision for a personnel large enough to man an efficient war fleet, and in neglecting to provide for the organization and training of the coast-defending force absolutely necessary for the protection of the commercial harbors. The militia laws of the nation provide the army with a practically unlimited reserve upon which to draw in time of war, and the interest taken by the state governments in their local military organizations provides the General Government with a fairly well-trained and organized body of troops, at all times immediately available for national service on land. In Boston and New York small battalions have been raised, mainly by individual effort, and, although but one year's trial has been had, sufficient encouragement has been given to continue the organization. The government really possesses no reserve for its small authorized force of enlisted men and boys of all classes, and at present has not the ability to add one trained man for service in an emergency on board a ship of war.

England, as far back as 1798, possessed a naval reserve under the name of the State Fencibles, recruited from the inhabitants of the maritime counties. In 1847 a force for the defense of the royal dock-yards was established, and officially known as the dock-yard battalions. This force gradually dwindled from 9000, and after an existence of twenty years finally disappeared. In 1853 a reserve force not to exceed 10,000 men was authorized and called Royal Naval Coast Volunteers. In 1859 the existing Royal Naval Reserve was established, composed of men who have served in the mercantile marine, those engaged in fishing, coasting, and other seafaring pursuits, boys of the mercantile training ships and firemen.

The present authorized strength is 920 officers and 30,000 enlisted men of all classes on the active list. In addition there is an honorary list of officers and pensioned men. The qualifications required of officers to be commissioned and men to be enrolled are excellent, so far as obtaining a superior class of seafaring men on a list presumed to be available for naval service is concerned. The uniform of officers and men is similar to that worn by corresponding grades in the regular service, but with readily noticeable distinctive marks. Any merchant ship commanded by an officer of the Royal Naval Reserve, and ten of whose crew are enrolled in the same corps, may be authorized by Admiralty warrant to fly the blue ensign. The full strength of the corps can never be available on short notice, for it is much scattered, and it would be a liberal estimate to state that within a fortnight after being called out not more than one-third the enrolled strength could present themselves at the rendezvous.

In France the entire male seafaring population has been enrolled in the *inscription maritime* since 1683, which includes all fishermen and boatmen on the coast and on the

rivers to the head of tide-water. The enrollment takes place at the age of eighteen years, subject to conditions; from that time to the age of fifty years the man is at all times liable to be called out for active service in the navy. The number enrolled is about 165,000, and from them 2400 are annually drafted into the navy for seven years' service. When the necessities of the fleet require it the minister of marine orders a levy, and when drafted they go to naval barracks and then aboard naval school ships for 1 year. The enrolled men have certain privileges granted them by the government; if injured or disabled they are entitled to a pension, and after the age of fifty receive a small pension.

The organization and administration of the German navy and the provision for a complete system of trained reserves are characterized by the same thoroughness which has distinguished that nation as the foremost military power of the age. All seafaring men of the maritime population between 17 and 45 years of age are enrolled and organized in a naval reserve. Each year in the spring the force is called out, and may be called upon oftener. From this force there is a conscription made for the fleet, and men conscripted must serve 3 years in active service, five years in the *seewehr* 1st class, and until the age of thirty-nine in the *seewehr* 2d class, after which they are transferred to the *landsturm* 2d class, where they remain enrolled until past the age limit. Every officer and man of the reserve is assigned to a particular ship or station in the maritime district to which he belongs, and upon the receipt of an order for mobilization goes directly to his designated post of duty. As about 5000 men are entered annually in the different branches of the navy and pass into one or the other of the reserve corps, the trained naval force available at short notice is large and efficient.

Italy has an inscription similar to that of France, but with a much wider application, since it includes, in addition to the merchant sailors, fishermen, and boatmen, all persons whose occupations are connected with the sea, such as shipwrights, carpenters, calkers, etc. The men enrolled number over two hundred thousand, are subject to call at any time, and must serve in the fleet or in the dock-yards as required.

In Russia the active navy, the naval reserve, and the coast defense are all so intimately connected that it is impossible to establish the line which separates their functions.

In Austria service in the navy is obligatory on the maritime population. Upon enrollment the recruit is assigned to a company and battalion, and his name is carried continuously on its rolls at the barracks of the battalion until his final discharge, whether he is on active service in the fleet, or on shore duty, or in the reserve.

Spain has a trained and organized naval reserve force of 50,000 men available for service afloat to supplement the active navy, and on shore to man the coast defenses. As in France, naval service is obligatory on the maritime population, a somewhat similar inscription being enforced.

The Swedish navy is manned by voluntary enlistments in time of peace, but for war the entire maritime population, numbering about 80,000 availables, is organized as a reserve to supplement the regular navy and to efficiently man the coast defenses. Norway's system is similar to that of Sweden. Holland has assignments of conscripts from the annual militia levy to depend upon.

Denmark's and Portugal's maritime population furnish war reserves. Greece has 30,000 naval reserves. Turkey has 44,500 seafaring men enrolled as availables. Japan has an excellent system of naval reserves, formed from trained men who have passed a term of service in the regular navy. The students from nautical training schools are upon graduation obliged to enroll themselves in the naval reserve. (From Office of Naval Intelligence Publication for 1888.)

NAVAL SCHOOLS OF INSTRUCTION. The United States Naval Academy at Annapolis is the only institution of the kind in this country. The naval cadets, as they are called, are appointed by the members of Congress of the district in which they reside, and must be between 15 and 20 years of age; in addition, the President is allowed ten appointments at large. The course includes four academic years and two years of active service aboard naval vessels, at the expiration of which there is a competitive examination, which determines the relative standing thereafter in the service. The first class at the academy at the beginning of its last scholastic year is separated into two divisions, in proportion to the number of vacancies in the preceding year in the lowest grades of the line of the navy and the marine corps and of the engineer corps. The cadets so assigned pursue a course of study calculated to best fit them for duty in the corps to which they will be assigned after graduation. No greater number of appointments into the lowest grades of the various corps are to be made each year than there have been vacancies for during the preceding fiscal year, with this exception; twelve each year are to be appointed to the line of the navy, two to the engineer corps and two to the marine corps. Both a physical and mental examination are required upon entering. The latter includes reading, writing, spelling, arithmetic, elementary algebra, grammar, geography, particularly the descriptive geography of this country, and the course of a vessel in making a voyage between well-known seaports, history, including the formation and adoption of the Constitution. Upon passing, the candidate receives an appointment as a naval cadet, receiving from the government $500 per year. At the end of the first and

third scholastic years cadets go aboard the practice vessel and cruise for three months; at the end of the second scholastic year they remain at the academy for practical exercises. The course of study for the first year is mathematics from fundamental algebra to spherical geometry inclusive; English grammar; ancient and modern history. French, Spanish, and German are given as an advanced course. The second year, descriptive geometry, trigonometry, analytical geometry; logic, themes, history, law, French, Spanish, German; mechanical drawing; physics and chemistry. The third year marine engines and boilers; differential and integral calculus, mechanics, physics, and chemistry; French; mechanical drawing; astronomy, navigation, and surveying. Fourth year, for the line division, seamanship, naval construction, and naval tactics; ordnance and gunnery; astronomy, navigation, and surveying; method of least squares and applied mechanics; physics and chemistry; international law; physiology and hygiene; for the engineer division, naval architecture; marine engines, designing and fabrication, boilers; method of least squares, applied mechanics; physics and chemistry; physiology and hygiene. In addition there are practical exercises in seamanship, ordnance, gunnery, astronomy, navigation, surveying and steam engineering which cover the successive steps from the beginner to the taking charge of the vessel's deck and running her machinery.
